Between 1954 and 1958, officials, educators, politicians and representatives of commerce and industry took part in negotiations on these matters and in the two Acts of 7 June 1958, the Danish educational system was given a form which it was felt could remedy the weaknesses in the previous structure. The new system (see diagram on page 411) applies both to town and rural schools so that children in the country are also able to receive secondary education near home.

All pupils in the sixth-year class must be given, in addition to the ordinary school subjects, instruction in one modern language, either English or German. In the seventh-year class those children considered by the school as being able to benefit from it, are taught one more foreign language, English or German, and mathematics.

At the end of the seventh school year, when pupils are 14 years of age, they can either leave school, continue for an eighth and possibly a ninth year at the general school, or be admitted to the 3-year *real* department. In the eighth and ninth school years, teaching in the ordinary primary school subjects is continued with the special view of preparing the pupils for transition to further education of a general or vocational nature. Where local school facilities permit, pupils may be divided into streams directed towards their future occupations, e.g. craftsmen, office workers, housework or the like, though actual vocational training is not given. When pupils leave school at the end of compulsory school age or later, the school is to give them leaving certificates stating their attainments in writing, Danish and arithmetic, a few other subjects and, if desired, a foreign language. Not before the eighth general school class may the school leaving certificates be based on special final tests in the subjects. The curricula of these classes that are now to be formed will be arranged so as to attract also the pupils formerly entering the examination section though intending later to seek apprenticeship in industry, commerce, etc. Employers are being induced to take kindly to these pupils who have received further schooling in the eighth- and ninth-year

classes. In this way it is hoped that a better balance will be created between the classes intended for pupils with practical gifts and the examination classes for more academically minded pupils.

The new Acts have retained the age limit of 14 for compulsory education, but municipalities are required to establish an eighth-year class when more than 10 pupils apply for this voluntary education. Municipalities are also obliged to pay for tuition of pupils in eighth- and ninth-year classes in another municipality if they have not set up such classes themselves.

Pupils wishing to take an examination may be admitted after the seventh school year to the 3-year *real* section provided that they have studied two foreign languages and mathematics in the sixth and seventh school years, and obtain a statement from their teachers that they are fitted for the *realskole* course and capable of completing this education in the normal time. As a rule no entrance test is required for admission to the *real* section but it can be asked for in certain cases.

The 3-year *real* section corresponds as regards period of schooling with the third- and fourth-year middle school classes and the *realklasse* of the former system, and the educational objectives and syllabus are the same. The *real* section stresses instruction in mathematics, physics, natural history and modern languages. It aims at giving all its students an education fitting them for civil life or preparing them for further training at certain institutions of higher education.

The time-table below is for the 4-year middle school plus *realklasse*. No syllabus and time-table have yet been prepared for the new 3-year *real* section. An innovation to meet the growing demand for technicians will be a special technical line in the third year of the new *realskole*, paying particular attention to the mathematics and physics group of subjects. Whilst arithmetic and mathematics were optional subjects for girls in the former *realklasse*, under the new scheme arithmetic will be a compulsory subject for both boys and girls and mathematics optional for both boys and girls in the third-year class (though not in the technical line).

The middle school examination (under the system now being replaced) is held at the completion of the fourth-year middle school class, as a written and oral test in the subjects that have been taught, though the school can choose to omit two subjects. Pupils who pass the middle school examination are admitted to the first-year class of the *gymnasie* or the *realklasse*. However, admission is at the school's discretion and pupils have no claim to enrolment. Many pupils who pass the middle school examination leave school in order to take up employment as apprentices in commerce and industry, etc.

Under the new school system, the examination at this stage is abolished. At the end of the second year of *realskole* a test is given which includes written papers in Danish, arithmetic and mathematics. Entry to the first class of a *gymnasie* is conditional upon a satisfactory result being shown in this test and a statement by the teachers that the pupil is fitted for education in the *gymnasie* section and considered capable of completing the studies there in the normal period of time. Pupils not admitted to the *gymnasie* section continue in the third class of the *realskole* section

and take the *realeksamen*. Appointments in certain civil service branches, post office, telegraphs, customs, state railways, etc., usually require the passing of the *realeksamen*. Pupils with this qualification can attend a 2-year course (*forberedelsesklasser*) to prepare for the *studentereksamen* (matriculation).

The *gymnasie* section under both the old and the new schemes comprises a 3-year course and concludes with the *studentereksamen*. Previously, pupils could choose one of three different lines, classical languages, modern languages or mathematics-science. In recent years the experiment has been made of establishing lines emphasizing other groups of subjects such as music, biology and sociology. Under the new Act no limit is set on the number of lines. The time-table given below is from the old scheme, as curricula and time-tables have not yet been prepared for the *gymnasie* section as organized according to the new Act.

The *studentereksamen* according to the new Act will be much the same as under the previous scheme. It will give admission to the universities and, though sometimes after special supplementary tests, to other institutions of higher education.

In examination schools, an annual test is given at the end of the school year which, in conjunction with the school's general assessment of the pupil, decides whether he will be moved up to a higher class. Several times a year the pupil is given a report book to take home to show parents, in which marks gained and teachers' comments are recorded.

In all state schools and in most municipal and private schools the school year runs from 1 August to 31 July, but there are a few schools where it is from 1 April to

31 March. Holidays include 6 weeks in summer, 1 week in autumn, 2 weeks at Christmas, 1 week at Easter and occasional days, making about 65 weekdays in all. The school week comprises 6 working days and the weekly hours in class must not exceed 36 lessons of 50 minutes each.

Teacher at *gymnasier* usually have a university degree, having passed the *skoleembedseksamen* which qualifies for teaching in secondary schools. This degree course is taken with a major subject and a minor, and usually lasts 7 to 8 years. Before permanent appointment in schools, all teachers must complete a course and pass a test in practical teaching technique, theoretical pedagogics and school hygiene. At first the teachers are engaged temporarily or as substitutes. The lower grade of permanently appointed teacher with a university degree is called *adjunkt*. After 15 years of service an *adjunkt* is promoted to a higher salary grading as *lektor*. The head of a *gymnasier* has the title of *rektor*.

Teachers at municipal middle and *real* schools must have qualified at a teacher training college as primary school teachers. This training is often supplemented by a special course in particular subjects. After a prescribed number of years in service, teachers are promoted to a higher salary grading.

The rest of this section on 'general secondary schools' will be devoted to institutions providing what has been termed 'further education'. Some of these schools come close to being vocational schools but all lay stress on general education.

Youth schools. The aim of these is to consolidate and to extend the teaching of general school subjects for young people between 14 and 18 who have left school, and to give them an understanding of the economic and civic life they are entering upon. Attendance is voluntary, but the legislation prescribes that all municipalities where at least 15 pupils have registered for instruction shall set up a youth school. At least one-third of the minimum number of teaching hours prescribed must be devoted to economic and social subjects, e.g. local or national commerce and industry, civics, history, literature, current affairs or economic geography. For the rest of the course, the school is free to teach whatever it likes, since instruction may comprise general subjects or emphasize purely vocational subjects. Young persons between 14 and 16 years of age are entitled to one afternoon off per week without loss of pay in order to attend a youth school. However, this does not apply to young persons on apprenticeship contracts or otherwise obtaining instruction under the Apprentice Act.

Evening schools. Evening schools must not prepare for any qualifying examination. Vocational subjects may be taught when no such instruction has been provided locally. In contrast to the youth school, which must teach a number of specified subjects, the evening school is not restricted as to what subjects it offers. The following groups of subjects may be taught: (a) cultural and social, e.g. literature, history, religion, civics, psychology, art, current affairs, science; (b) ordinary school subjects, e.g. Danish, arithmetic, writing, foreign languages and domestic science; (c) manual subjects, e.g. woodwork, crafts and needlework; (d) vocational subjects, e.g. book-keeping, typewriting, shorthand, agriculture, horticulture and fishery.

Instruction at the evening schools must be of at least 20 hours' duration per week.

Junior folk high schools. The origin and aims of these schools are the same as those of the folk high schools proper, but the difference is that they are for young people between the ages of 14 and 18. Their purpose is to give instruction that will further the general education and training of the pupils but not prepare for any examination nor train for any definite occupation. The schools are usually residential, offering a summer course of not less than 3 months or a winter course of not less than 5 months, or possibly both. Instruction must be at least 30 hours weekly with particular emphasis on practical subjects. However, more general subjects such as Danish, arithmetic, history and geography may also be taught.

Agricultural courses. These are run by agricultural associations. They occupy an intermediate position between youth schools of a more general character and vocational schools, but are subject on the whole to the rules which apply to the evening schools. The main subjects are animal husbandry, treatment of soil, plant culture, book-keeping, etc. Up to one quarter of the total teaching time—at least 40 hours—can however be used for subjects connected with agriculture or its subsidiary occupations, such as the keeping of poultry, rabbits and bees, and fruit growing. The courses are generally run in winter but may be supplemented by summer courses.

Correspondence schools. To obtain recognition and state subsidy, a school must each year teach at least 50 pupils and receive and correct at least 500 lessons by post.

Leisure activities, etc. Besides the youth schools proper, financial support is given by the central and local government authorities to leisure activities for youth, when certain conditions are fulfilled. Thus this applies to youth clubs and camp schools run in connexion with youth schools. Independent clubs for young people between the ages of 14 and 18 can also obtain grants, subject to certain conditions.

Domestic science schools. Training is both theoretical and practical. Besides subjects such as cookery, cleaning, washing, chemistry, physics, nutrition, household finance and accounts, hygiene and the care of children, general subjects like history and literature, are also taught. Usually two separate courses are held each year of a minimum duration of 5 and 3 months, respectively, though a school with only one course a year may also obtain approval. Only pupils who reach the age of 17 years before the end of a course are counted for the purposes of obtaining a subsidy.

Folk high schools. In contrast to the junior folk high schools described above, the folk high schools are intended for rather older pupils who have to be 18 years of age before the completion of a course. They are private, are nearly all residential, and are chiefly attended by young people from farms. They aim partly at giving their pupils a general education in ordinary school subjects, such as Danish, arithmetic, civics, history, geography, book-keeping, drawing, singing and gymnastics; and partly through lessons, lectures and study groups to help develop character and to give the pupils a deeper understanding of their environment and of their country, fitting them to continue the development of an active mind in their later life. To obtain a state subsidy, a school must offer each year at least one course of 5 months' duration or one of 3 months.

Agricultural schools. Pupils must reach the age of 18 years before the close of their course. Besides instruction in agriculture, more general subjects are usually taught. The purpose of these schools and the prevailing spirit in the teaching are the same as in the folk high schools.

Teachers in the above-mentioned schools of further education have very often been trained as primary school teachers. In fact teachers in primary schools may also teach at youth and evening schools, their hours of instruction at the latter schools being included in the obligatory number of hours at the public primary schools. Teachers at youth schools of a vocational character must naturally have had special training in the subjects they undertake to teach.

Commercial schools

Schools for apprentices. Courses in general theory, usually 3-year, are obligatory for various categories of commercial apprentices. The schools for commercial apprentices have three different curricula: one for prospective shop-assistants, one for articled clerks, and one for prospective correspondents. As an example, the curriculum for articled clerks, who have generally passed the *realeksamen*, comprises: typewriting, English, German, bookkeeping, commercial arithmetic, commercial law, office routine. In 'office routine' the pupils are taught not only commercial correspondence, but also how to fill in and use correctly the documents connected with a business transaction: cheques, bills of exchange, bills of lading, invoices, etc.

According to the law on apprenticeship, attendance at the schools for commercial apprentices is compulsory. There is no freedom of choice among subjects; the pupils are given an all-round training in commercial subjects and do not specialize at this age. Having their practical work to attend to, apprentices take only 6 or 8 lessons a week for 3 years. The course ends with an examination. Compulsory school attendance after 6 p.m. is prohibited.

Evening courses. Besides the obligatory courses for apprentices a number of commercial schools run 1- or 2-year courses in single subjects: English, German, French, typewriting and shorthand, commercial and industrial book-keeping and accounting, business economics and commercial law. These are evening courses, as students, according to the official regulations, are admitted only if they are over 18 years, so that they are usually employed in ordinary daytime jobs in business. (This age limit is inserted in accordance with the provisions of the law on apprenticeship, which concerns young people who are under 18 when they start business careers.) Students taking these evening courses have usually passed the *realeksamen*, and often the Articled Clerks' Final Examination too. The number of weekly lessons is usually 4 to 6, so much homework is required. The courses lead to state-controlled examinations.

Full-time commercial schools. These are of two main types, one leading up to the Commercial Examination, and the other to the Higher Commercial Examination.

Commercial Examination. The course for this examination is usually of 1 year's duration and is organized in three different ways according to the qualifications of the students: (a) for students who have had no special schooling; (b) for students who have been educated to a level equivalent to the middle school examination; and (c) for students who have passed the *realeksamen*. Course (c) comprises Danish (3 periods per week), arithmetic (4), book-keeping and accounting (4), office routine (2), commercial law (2), commercial geography (2), national economics and Danish institutions (3), typewriting (2 or 4), English (6), German (6). The minimum number of periods per week is 34, but course (c) is often augmented by supplementary subjects. The average age of the students is 21, as quite a number of them have served their full apprenticeship and taken the final examination. All three courses lead up to the Commercial Examination, with differences only as far as the foreign languages are concerned.

The Higher Commercial Examination. This course was originally arranged as a 2-year course for young business people who had passed the *realeksamen*, or the *studenter-eksamen*, and served their apprenticeship, and was aimed at preparing students to take up leading positions in

business. This arrangement was later supplemented by 1-year classes for students who have passed the Matriculation examination, and 1-year classes for students who have passed the Commercial Examination, type (c) (including English and German). Whether a student attends the regular 2-year course or one of the special 1-year classes the same examination is taken.

The curriculum of the 2-year course includes: Danish, arithmetic, book-keeping and accounting, office routine, commercial law, commercial geography, universal history, commercial history, Danish institutions and statistics, business economics, English, German, typewriting, and one or more supplementary subjects (French, shorthand, management) are added to bring the total number of weekly periods up to 34.

Some teachers at the commercial schools have qualified themselves for teaching in the non-examination middle schools; others are masters of arts, i.e. qualified to teach in a *gymnasie;* others again, especially those who teach commercial subjects, have taken the diploma or certificate at the Graduate Business School. All take a special examination for commercial teachers which covers business law and economics and the subject in which they are to teach, e.g. book-keeping, commercial arithmetic, etc. They must attend lectures and pass an examination in the methodology of teaching, at the same time attending the lessons of an experienced teacher and doing some teaching themselves under his control and guidance.

Technical schools

Training of apprentices in workshops, factories and the building trades. School instruction consists of the teaching of theory and may also include practical work. Apprenticeships usually last 4 years, but there are some trades with a 2-year apprenticeship. Theoretical instruction at the technical school consists of 600–800 teaching hours distributed over the whole period of apprenticeship. The Apprentice Act provides that the respective trade committees, after consultation with the State Inspectorate of Craft Education, shall decide whether instruction shall be arranged in the daytime or in the evening, or as combined day and evening school. Day teaching must conclude by 6 p.m. and evening school by 8 p.m. The introduction of obligatory daytime instruction is contemplated, to begin in 1964. Instruction at the technical school is usually divided into a preliminary part which is intended to be completed in the first half-year at the school. This includes geometrical drawing, projection and free-hand drawing, and the subjects related to the students' trade such as specialized drawing, lettering, trade technology, and possibly laboratory work, materials, mechanical engineering, arithmetic and Danish, book-keeping. Other optional subjects include literature, history, languages, singing, etc. Apprentices completing the obligatory instruction receive on request a certificate of attendance. In conjunction with study at the technical schools, instruction can be given in special trade schools if these have been set up by the trade concerned. Advanced training can be given at special craft schools (daytime schools, both with or without final examinations), e.g. builders', carpenters', painters' schools, etc.

Training for certain types of technicians. Pupils in the eighth- and ninth-year classes of the primary school can prepare for an entrance test to a training course for certain types of technicians; the test consists of written papers in Danish, arithmetic and mathematics, and oral tests in these subjects, as well as in physics and English. Successful candidates, provided that they are at least 16 years of age, can take a course for technical assistants or one for laboratory assistants and technicians. Pupils who have passed the *realeksamen* do not need to take the test. The training of technical assistants is conducted at the technical schools and comprises one half-year of theoretical instruction followed by one year of practical training at a suitable workshop or factory and finally another half-year of theoretical instruction at the school. The course aims at qualifying students for work as calculators, draughtsmen and managerial assistants in factories and workshops.

The training course for laboratory assistants comprises 24 weeks at the technological institutes. After passing the examination and following 1 year of approved practice, a further 21 weeks of schooling enables the student to sit the examination for laboratory technicians.

Instructors at the technical schools are usually connected with factories, workshops or the building trades in their daily occupations and teach in their spare time, though a number of primary school teachers also teach at the schools. The State Technical Instructors' Course provides training for these teachers.

Other vocational schools

There are also *pre-sea training schools* for young persons between the ages of 15 and 18 who wish to qualify for signing on as junior ordinary seamen. These schools give a general education and elementary practical and theoretical instruction in seamanship.

Pre-sea training schools have been established by the State in three towns under an Act on the Training of Seamen of 7 June 1952. Expenses in connexion with operation and administration of the schools are borne by the Treasury. Every Danish ship liable to registry and of more than 60 tons (gross) in size, fishing vessels excepted, pays an annual contribution towards the operation of the schools of 18 öre per ton. Two private schools have also been opened.

The Director of Nautical Education is responsible for the management of the schools, which are residential. Each course lasts 3 months, this time counting for the 12 months' sea-service required under Danish manning rules for signing on as a junior ordinary seaman.

School fees covering instruction and full board are 375 kroner for a whole course. Deserving and impecunious pupils may be exempted from paying fees either wholly or in part. At each of the schools there is a local board consisting of three members whose task is to assist the school in planning lectures, excursions, sports, etc.

The training of *dairy apprentices*, which does not come under the *Apprentice Act*, is under the Ministry of Agriculture. Practical training is given under an employer for 3½ years, theoretical training at a commercial or technical school, and finally there is a 6 months' theoretical course at a dairy school which is residential as a rule. Instruction

covers 900 hours and includes Danish, arithmetic, civics, dairying, physics and chemistry, mechanical engineering, bacteriology, etc. Two-thirds of the lessons must be devoted to purely technical subjects. The course is concluded with a test.

Teacher training schools

Colleges for training teachers for primary schools are intended for rather older students who have to be at least 18 years of age at entrance. A detailed description is outside the scope of this report.

Other specialized schools

The conservatories of music in Copenhagen and in some of the other larger towns give advanced training in music and singing. The Royal Danish Academy of Fine Arts trains painters and sculptors. Other schools are the Craft School in Copenhagen, the Society for the Encouragement of Needlework, and a number of dramatic schools, foremost being the Royal Theatre School of Acting and Ballet in Copenhagen. All over the country there are also a great number of private schools and courses teaching typing, shorthand, languages, book-keeping and many other subjects.

Out-of-class activities

The legislation does not provide for the participation by pupils in the management of the schools. In practice, however, 'student councils' are often set up, chiefly at *gymnasier*. These are representative bodies, elected by the pupils, which protect the pupils' interests and negotiate with the headmaster and teachers on their behalf. In some cases the student council acts in conjunction with some form of prefect system, with the prefects being entrusted with certain duties of maintaining order. Together with other school associations (debating clubs, sports clubs, dramatic societies, musical societies, etc.) the student council takes care of arrangements for school parties and outings. Many schools publish school magazines which are edited by pupils and which deal with problems of the school, politics and matters of general interest, often without censorship by the headmaster.

The schools usually give the pupils an opportunity for voluntary athletics outside school time. The school gymnastics teacher is in charge and the activities are subsidized from public funds. In recent years many *gymnasier* have had voluntary school choirs and orchestras established with state assistance.

TRENDS AND PROBLEMS

The paramount problem in Danish education in recent years has been the implementation of the new educational scheme adopted in 1958 for the primary school and the *gymnasie*. The framework of the new system is given in the Acts, but detailed regulations are still to be drawn up and curricula prepared. Work on the latter is now being done by two committees appointed by the Ministry, consisting of officials and educationists; these curricula must be designed so that the non-examination section in particular will attract bright pupils who do not wish to take the examination course. Teaching will be directed towards the pupils' subsequent occupations and at making employers interested in engaging the pupils who have passed through the non-examination classes rather than those who have completed the *real* section. It must at the same time be borne in mind that the school has to give pupils a general education.

Recent developments in technology also necessitate the expansion of advanced technical training if Denmark is to be able to compete with other countries. This situation, in conjunction with the bulge caused by the high birth-rate years from the end of the 1930s and the early 1940s, will exert very great pressure upon the *gymnasier* in the immediate future. Both as regards premises (in spite of the considerable numbers of schools that have been built in recent years) and the securing of the necessary teaching staff, great difficulties will be experienced. To make it possible for all suitable pupils to receive higher education regardless of their financial situation, there must perhaps be a further expansion of economic assistance from the State for young people.

The technical and commercial schools are also under pressure from the bulge, and as a result of the increasing demands for training required by the advance of mechanization.

The form of instruction in the *gymnasier* has also been the subject of debate in recent years. It is claimed that efforts should be made to evolve a type of education that will develop independence in pupils to a greater degree than under the present system, to fight the tendency towards isolation of subjects—e.g. by conferences of teachers to improve co-operation or days during which the teaching is characterized by a definite group of subjects. It is desired also to have more time allocated to non-compulsory subjects and study group activities. All these problems, however, will be dealt with by the committee appointed to work on the curriculum for *gymnasier*.

STATISTICS

Population (mid-year 1938 estimate):[1] 4,515,000.
Area: 16,619 square miles; 43,042 square kilometres.
Population density: 272 per square mile; 105 per square kilometre.

Summary of school statistics, 1953–57. For the school year 1957/58, total enrolment may be roughly estimated as over 810,000, although the most recent data relating to the number of pupils enrolled in vocational schools refer to 1956/57. The number of persons attending adult education classes or schools is not included in the total mentioned. This represents a school-going population of 18 per cent of the total population.

Between 1953 and 1957, total enrolment increased by 11 per cent. During this period, the proportion of girls in schools has remained fairly constant, i.e. around 49 per cent in primary schools, 51 per cent in general secondary schools, 47 per cent in higher teacher training colleges.

There has been no significant change in the proportion of women on the teaching staff: 48 per cent women teachers in primary schools in 1957/58 and 45 per cent in 1953/54; 35 per cent in general secondary schools in 1957/58 and in 1953/54.

In 1953/54 and in 1954/55, enrolment in vocational schools was higher than in general secondary schools, but in 1956/57 enrolment in the former was only 90 per cent of enrolment in the latter. Between 1953 and 1956, total enrolment in secondary education increased by 14 per cent. (See Table 2.)

Enrolment trends in secondary education, 1950–57. Enrolment in vocational secondary schools and in technical schools doubled between 1930 and 1949. Thus the ratio obtained by relating the average enrolment to the estimated population 15–19 years old rose significantly. For the years since 1950, this ratio has been based on enrolment in all types of secondary schools and is therefore not directly comparable with those for preceding years. Nevertheless, there was a real increase in enrolment between 1945 and 1954 which continued until 1957. (See Table 3.)

Examination results in secondary education, 1953–57. Diplomas and certificates in 1957/58 numbered 35,954 as compared with 29,476 in 1953/54, an increase of 12 per cent for this period. The proportion of certificates awarded to girls was 51 per cent in both years. (See Table 4.)

FAROE ISLANDS

Faroese education is based mainly on the Act of 1 March 1854 on the organization of schools and education in the Faroe Islands, the Royal Ordinance No. 11 of 16 January 1912 on various matters relating to the primary schools, and Act No. 199 of 12 April 1949 on salaries and pensions for primary school teachers in the Faroe Islands, all with their subsequent amendments.

There are four schools preparing for the middle school and *real* examinations or for the general preliminary examination (see chapter on Denmark). There are also some 2-year and 3-year tutorial courses preparing for the general preliminary examination, and in 1937 one was established to prepare for the *studentereksamen* (university entrance). These examination schools and courses are all run by the public authorities, and organized as regards teaching and examinations according to the same rules that apply to similar schools in the rest of Denmark. In 1870 a training college was already established in the Faroe Islands for the education of teachers to be appointed to local schools. The training takes 4 years.

An important part of the education of young Faroese is provided by the evening schools, which are well attended.

Throughout the years it has been a problem whether Danish or Faroese should be the language of instruction in the Faroese schools. Both languages are included as subjects in the school curriculum. An Ordinance of 12 December 1938 required equal proficiency in the reading, speaking and writing of the two languages. Actual recognition of Faroese as the main language came with Act No. 137 of 23 March 1948 on home rule for the Faroe Islands. However, Danish must be taught carefully and well, and can still be used for official purposes as well as Faroese.

The above Act on Faroese home rule prescribes that a number of fields of public administration shall be wholly within the hands of the Faroese, whilst others shall be matters of joint concern to be subsidized by the Danish State and subject to rules laid down by the Danish Parliament. Although in principle education is to be taken over by the Faroese the Act provides that for the present it shall continue to be of joint concern. The Danish Treasury thus defrays about one-half of the expenditure on Faroese education. Under Act No. 199 of 12 April 1949 on salaries and pensions for primary school teachers in the Faroe Islands, salaries for teachers were fixed at the same level as those in the rest of the kingdom.

The highest organ of educational administration is the Faroese Educational Authority, comprising the *Rigsombudsmand* (Danish Government Commissioner), the Dean, and three members chosen by the *Lagting* (Faroese legislature). In 1955 the post was created of a Faroese educational adviser, who is to act as the educational authority's consultant in school and educational matters. The local education authorities consist of a managing board (parish council) and the education committee.

The two Danish Education Acts of 7 June 1958 reorganizing the Danish school system, do not apply to the Faroe Islands. However, there is provision for the Acts to be made applicable to the Faroe Islands through Royal Ordinance, with such amendments as may be required by the different conditions. The question as to whether the school system should be changed so as to provide pupils in Faroese schools with the same educational opportunities as those enjoyed by children in the rest of the kingdom is now under consideration.

[*Text prepared by the Danish National Commission for Unesco in August 1959.*]

STATISTICS

Population (mid-year 1958 estimate): 34,000.
Area: 540 square miles; 1,399 square kilometres.
Population density: 63 per square mile; 24 per square kilometre.

Summary of school statistics, 1953–57. In the school year 1957/58, a total of 5,628 pupils were enrolled in primary schools, general secondary schools or courses, and in teacher training classes. As compared with 1953/54, total enrolment in these schools had increased by 10 per cent. In general secondary schools total enrolment increased by 34 per cent but girls' enrolment by only 14 per cent. (See table.)

Educational finance, 1957/58. For the year 1957/58 the Danish Government provided 1,564,000 Danish kroner for recurring expenditure on education, including 1,494,000 kroner for primary and secondary education and 70,000 kroner for teacher training. In addition an estimated amount of 1,551,000 kroner was budgeted by the local government. The estimated total expenditure on education therefore amounted to 3,115,000 kroner.

1. Information on nursery schools is available only for 1956/57 when there were two schools with 154 (F. 95) pupils.
2. Public schools only, including teachers of general secondary schools.
3. Teachers in general secondary schools are also included in primary schools.
4. No information is available for 1956/57 or 1957/58.

GREENLAND

During the nineteenth century seminaries were set up for the training of catechists, and later a post-primary school of 2 years' duration was established to provide for brighter pupils completing the 7-year primary course. This was further expanded under the Act of 18 April 1925 by a 2-year high school followed again by a 2-year seminary. When the desire arose to conform as closely as possible to the Danish educational system, the entire structure of Greenland education was altered by the Act of 27 May 1950.

There are now three post-primary schools giving a 2-year course, and serving partly as classes where the better qualified over-14-year-olds from the smaller district schools are assembled. Their function is also to round off and consolidate the children's attainments; the course is concluded by both written and oral examinations. Some of the pupils then enter occupations; others go on to institutes and workshops for further special training.

There is also a *realskole* (general secondary school) in

Godthaab. A 4-year course comprising all the general school subjects and including English, German, and mathematics, is concluded with a written and oral official examination, giving the same privileges and prospects as the *realeksamen* in Denmark. Up till now only a small number of pupils from the post-primary schools have been able to enter the *realskole* but the intention is that in time the post-primary schools should disappear, so that pupils from the primary school can proceed directly to secondary school.

The language of instruction in the post-primary schools and the *realskole* is Danish, except in the subjects of religion and Greenlandic. Teaching material is likewise in Danish. Fully qualified teachers are employed at these establishments, which are all boarding schools. Board and tuition are free, and pupils receive in addition an allowance for clothing and pocket money, irrespective of their parents' financial circumstances.

After passing the *realeksamen* pupils can be recommended for further education at State expense (loans on favourable terms) at *gymnasier* (upper secondary schools preparing for university) or teacher training schools in Denmark, and then for the university or other institutions of higher education. They can also enter the teacher training course at the seminary in Godthaab. This offers a special 2-year course in the history and practice of education, which is followed by 1 year of practice teaching at smaller Danish schools.

In 1955 domestic science schools were set up in connexion with two of the post-primary schools, offering an 8 months' course. At the shipyard in Holsteinsborg there is an apprentice hostel with a technical school, giving the apprentices a 4-year course of theoretical instruction. The teaching staff includes specially engaged instructors as well as teachers from the local schools.

Technical education in general, and commercial education, are provided in evening schools, which also teach other subjects such as foreign languages, domestic science, woodwork, needlework, arithmetic, etc.

All secondary education comes under the school directorate in Godthaab, though the *realeksamen* is controlled by the Danish Ministry for Greenland, which also administers the year of practice teaching done by seminary students. All expenditure on secondary education is voted under the annual Finance Act as part of the Danish state budget.

Area: 840,001 square miles; 2,175,600 square kilometres.
Population density: 0.03 per square mile; 0.01 per square kilometre.

Summary of school statistics, 1953–57. As compared with 1953/54, total enrolment at all levels in 1957/58 had increased by 7 per cent and total enrolment in secondary schools and in the teacher training college by 34 per cent. (See Table 2.)

Educational finance, 1957. Table 1 shows that during the fiscal year beginning in January 1957 a total of 11.5 million Danish kroner was spent on education, averaging a little over 400 kroner per inhabitant as compared with 300 in 1954 (see *World Survey of Education: II—Primary Education*). Of this amount, 79 per cent was recurring expenditure; the remaining 21 per cent was capital expenditure.

Source. Denmark: Ministry for Greenland, reply to Unesco questionnaire.

1. The teachers are primary school teachers who are partly engaged at these schools.

2. Not including technical schools.

DOMINICAN REPUBLIC

THE EDUCATIONAL SYSTEM

Paragraph 4 of Article 6 of the Constitution recognizes freedom of education as a right inherent in the human personality. It states further: 'Primary instruction shall be under the supervision of the State, and shall be compulsory for children of school age, in the form established by law. In official institutions, this instruction, as well as that provided by schools of agriculture, manual arts and domestic economy, shall be free.'

The Dominican school system is governed by the Organic Law on Education, the Law on Compulsory Primary Education and the Law on University Organization.

Role of public authorities. The administrative and executive authority in the Dominican educational system is the Ministry for Education and Fine Arts, which is advised by the National Board of Education (*Consejo Nacional de Educación*). The latter consists of six members under the chairmanship of the Minister of Education and Fine Arts, who is a member *ex officio*.

The main duties of the board are: (a) to define the scope of the various branches of education, excepting universities; (b) to establish curricula for each branch of education and the syllabus to be followed in the teaching of each subject; (c) to determine the examinations to be taken by candidates for official diplomas or certificates, and to lay down rules concerning such examinations and the dates at which they are to be held; (d) to establish regulations concerning the diplomas or certificates required for appointment to

teaching posts in the various branches and levels of education, school and competitive examinations, and school discipline; (e) to determine equivalence between studies pursued abroad and the corresponding national courses, except in the case of university studies; and (f) to approve textbooks for use in teaching.

For the purposes of school administration, the Dominican national territory is divided into 5 regions, or *intendencias de educación*, and 65 school districts, each of the former being under an education officer (*intendente*), and each of the latter under an inspector of schools. Education officers must carry out, or ensure the implementation within their region of all decisions emanating from the Ministry of Education and Fine Arts and the National Board of Education. They must also inspect personally, at least once every two months, each institution in their region providing secondary education, teacher training, and vocational and special education and the administrative offices belonging to these institutions.

There are both public and private schools. Public schools may be official or semi-official institutions, depending on whether they are maintained entirely out of public funds or, as in the case of colleges and schools receiving grants-in-aid from the State, only in part.

Role of private agencies. Private schools are entirely free, and any person, corporation, association or society may found educational establishments and give instruction in any branch of knowledge without being required first to obtain a licence or to comply with official regulations, syllabuses, methods or texts, except in the case of primary education, which is always subject to the official regulations, syllabuses and texts, and is supervised by the State.

Structure of the school system. The following types of education are recognized by Article 3 of the Organic Law on Education (1951): (a) nursery; (b) primary; (c) intermediate; (d) secondary; (e) rural primary and secondary teacher training; (f) further vocational, technical and artistic education; (g) special; (h) university. The principal types of schools are shown in the diagram on p. 429.

THE DEVELOPMENT OF SECONDARY EDUCATION

At the end of the last century (1895), the General Law on Public Instruction placed the control of education in the hands of the Higher Educational Council (*Junta Superior de Estudios*), provincial councils and local committees. Primary and teacher training schools remained under the jurisdiction of the provincial councils, while institutions at secondary level known as 'central colleges' and the Professional Institute (vocational training) were placed under that of the council.

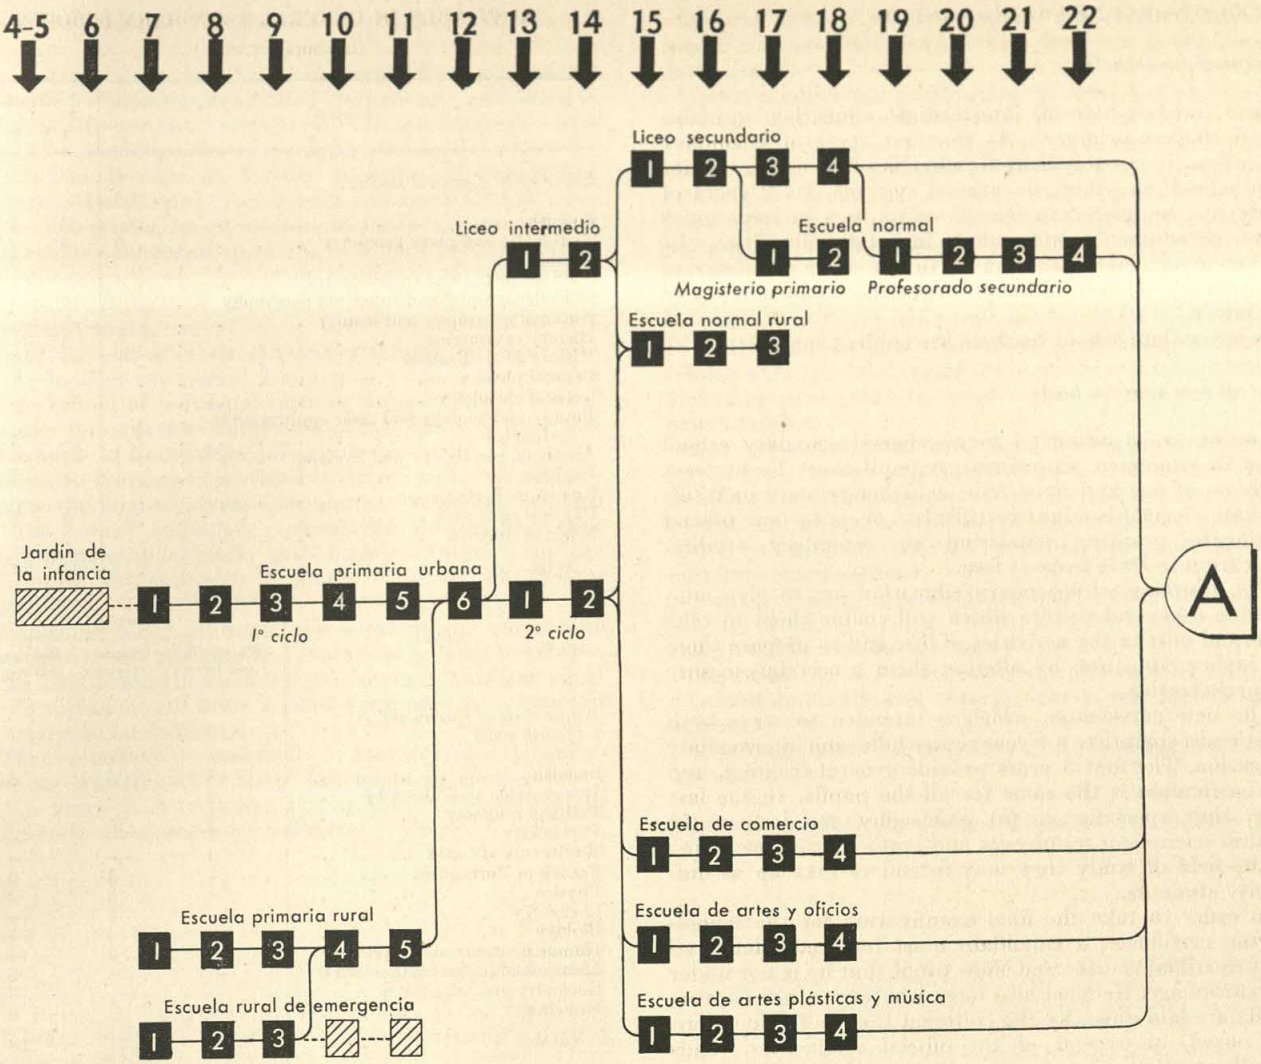
1902. A Directorate of Teacher Training was established. The central colleges were abolished and replaced by training colleges for primary and secondary teachers and by *escuelas de bachilleres* (general secondary schools). The general law on education was amended. A Higher Council of Administration and a Special Council of Administration were placed in charge of all forms of education except teacher training and ecclesiastical and vocational education. A inspector of education was appointed in each provincial capital, and a special committee set up in each commune and administrative district.

1914. The organic statutory code on public education was promulgated. It laid down that the Minister of Education should be generally responsible for education and should direct public instruction in collaboration with the National Board of Education, the provincial councils and the district education committees. Technical direction and inspection were to be the principal responsibilities of a superintendent of education and of the provincial supervisors and municipal inspectors of public education. Education, from the nursery and primary stages onwards, was divided into official-public, semi-official and private categories.

1918. The Law on the Administration of Public Education was promulgated, laying down rules for the organization, operation and work of the National Board of Education.

1930. Law No. 53 provided for the revision of all laws and regulations governing education, and set up a committee on educational reform.

1951. A new Organic Law on Education was approved, embodying all previous regulations which were still pertinent, laying down in detail the basic policy of Dominican education, and recognizing and organizing the various types of education (see above). University education is governed by special laws. Primary instruction, which is compulsory for all children between the ages of 7 and 14, is also completely free of charge in official schools.



1952. The relevant ordinances establishing teacher training colleges and rural teacher training schools were approved.

1954. Under the Concordat signed by the Dominican Government and the Holy See, the education provided by the State in public schools shall be guided by the principles of Catholic doctrine and ethics. In all public schools, the Catholic religion and ethics shall be taught to all pupils whose parents or guardians do not ask in writing for them to be excused from such instruction. Furthermore, the Dominican State guarantees to the Catholic Church full liberty to establish and maintain schools of all types and levels under ecclesiastical authority; certificates awarded by primary schools of this class will have the same value as those awarded by the corresponding state institutions.

Administration. The Ministry of Education and Fine Arts includes a General Directorate of Primary and Intermediate Education and a General Directorate of Secondary, Teacher Training and Vocational Education.

All public schools providing secondary education, teacher training, and vocational and special education are under the direct authority of the regional education officers (*intendentes*), except in cases where the National Board of Education places a school under some other educational authority. Public intermediate establishments are without exception directly controlled by the district inspectors.

Secondary school teachers are paid by the State. Their remuneration is in proportion to their hours of work, and there is no uniform salary scale applied throughout the country. The work assigned to teachers and the salaries they receive depend on their academic qualifications, their experience and their speciality.

GLOSSARY

escuela de artes plásticas y música: school providing vocational training in fine arts and music.

escuela de artes y oficios: school providing vocational training in applied arts and crafts.

escuela de comercio: vocational secondary school of commerce.

escuela normal superior: teacher training college; sections for primary teachers (*magisterio primario*) and secondary teachers (*profesorado secundario*).

escuela normal rural: teacher training school for teachers in rural primary schools.

escuela primaria rural: rural primary school with practical bias related to needs of environment.

escuela primaria urbana: urban primary school.

escuela rural de emergencia: incomplete rural primary school.

jardín de la infancia: pre-primary school.

liceo intermedio (*liceo de educación intermedia*): lower general secondary school.

liceo secundario (*liceo de educación secundaria*): upper general secondary school with course providing 3 years of general study and a final year of specialization (in philosophy, or mathematics and physics, or physics and natural sciences), leading to baccalaureate.

HIGHER EDUCATION

A. University of Santo Domingo (faculties of dentistry, law, medicine, pharmacy and chemistry, philosophy, science and engineering, veterinary science and agronomy), Loyola Polytechnic Institute, College of Accountancy, and various national schools of advanced professional training.

TYPES OF SECONDARY EDUCATION

Intermediate schools

Before the last reform, intermediate education was also called 'higher primary'. As the first stage of secondary education, it is equivalent to what is often called 'junior high school' in other educational systems. Its 2 years of study are completed in schools of its own in large cities (*liceos de educación intermedia*); in smaller localities, the intermediate classes are housed in the same buildings as the primary schools, although organized independently of the latter.

Intermediate school teachers are subject specialists.

General secondary schools

In order to be admitted to a general secondary school (*liceo de educación secundaria*), a pupil must be at least 12 years of age and must have a higher-primary or intermediate school-leaving certificate, or else an official certificate granting admission to secondary studies. Education in state *liceos* is free.

The purposes of secondary education are to give adolescents a general culture which will enable them to take a normal part in the activities of life, and to prepare them for higher education by offering them a certain measure of specialization.

The new curriculum, which is intended to serve both these ends, comprises a 4-year course following intermediate education. The first 3 years provide general training, and the curriculum is the same for all the pupils. In the last year, they specialize in (a) philosophy and letters, (b) natural sciences or (c) physics and mathematics, according to the field of study they may intend to take up as university students.

In order to take the final examination for the school-leaving certificate, a candidate must have completed all the prescribed courses and show proof that he is not under 16 years of age. He must also meet whatever other requirements are laid down by the National Board of Education; the board, on receipt of the official certificates, sends *bachillerato* diplomas to pupils who have obtained a pass in all subjects.

The National Board of Education determines the form to be given to examinations. Pupils in secondary and teacher training schools must take the following: four-monthly examinations, in February and June, to check their progress; general examinations in July, which may be completed in or postponed until September; one exceptional examination for pupils in their last year who still have to pass in three subjects.

The subjects taken for the usual *bachillerato* course, designed to meet the needs of students going on to university, are shown in the accompanying table.

There is also a feminine *bachillerato en artes y letras* which offers girls who do not wish to pursue university careers an opportunity to acquire general culture and certain artistic and domestic skills. This is a 3-year course, and the subjects include general culture, languages, home economics, gardening, sports, dressmaking, outline of the history of art, music and painting.

TIME-TABLE IN GENERAL SECONDARY SCHOOLS
(in hours per week)

Total	21	22	23

Teaching staff. Teachers in general secondary schools must have a secondary school teacher's diploma from an *escuela normal superior* (teacher training college). Candidates for enrolment in the professional training courses at these colleges must have completed the secondary course leading to the *bachillerato*. The duration of studies at teacher training colleges is 4 years, comprising 2 years of general education and 2 more of professional training. There are three possible fields of specialization: letters, sciences, and modern languages (French or English).

Each teacher must do at least 25 hours of teaching per week. At the age of 60, and after at least 25 years of service, teachers retire with a pension amounting to between 40 and 60 per cent of their final salary, according to the number of their dependents and the cost of living in their place of residence.

Vocational and technical schools

The National School of Arts and Crafts (Escuela Nacional de Artes y Oficios) trains skilled workers and craftsmen in general engineering, carpentry, cabinet-making, automobile engineering, electricity and radio engineering.

The San Ignacio de Loyola Institute of Technology (Instituto Politécnico 'San Ignacio de Loyola') has more than 1,000 pupils. Its curriculum includes subjects relating to general culture and special preparation for agricultural experts, mechanics, electricians, plumbers, cabinetmakers, etc. The teaching is divided into primary, intermediate and secondary stages.

Girls' education receives special attention in Dominican curricula, and vocational training of women is provided by the school of industrial training for girls, the school of nursing, the school of hairdressing and beauty culture and the schools of home economics.

Business training is provided in three stages: elementary commercial courses given in semi-official schools subsidized by the State; secondary commercial courses, in state business-training schools; and higher education in the College of Accountancy (Escuela Superior de Peritos Contadores).

Pupils wishing to enter the elementary commercial school must hold the intermediate school-leaving certificate. After two years, they receive an assistant business secretary's diploma, and after a third year, that of a business secretary or book-keeper.

The secondary commercial course in state business-training schools, which is a full business course, has a 3-year curriculum including the ordinary subjects for the secondary school-leaving certificate.

In the College of Accountancy the syllabus covers 4 years of specialized studies and leads to a diploma in accountancy.

Artistic education is dispensed by the National School of Fine Arts (Escuela Nacional de Bellas Artes) where teachers of drawing, painting and sculpture are trained, the National Conservatory of Music and Elocution (Conservatorio Nacional de Música y Declamación), the Liceo Musical 'Pablo Claudio' at San Cristobal (college of music), and various other institutions.

Teacher training schools

Primary teachers are trained at rural teacher training schools or in special sections of the teacher training colleges, according to whether the pupil wishes to be a rural or an urban teacher.

For admission to the rural teacher training institutions, pupils must be at least 14 years of age, hold the official certificate of satisfactory performance in the intermediate course, and present a health certificate issued by the school doctor. Candidates over 20 years of age must pass an entrance examination.

Pupils wishing to enter the special section of a higher teacher training college mentioned above must have completed 2 years of secondary school.

The course lasts 3 years for rural teachers, and 2 for urban teachers, in addition to their 2 years of general secondary studies.

The courses are free, and most of the training institutions are residential.

STATISTICS

Population (mid-year 1958 estimate): 2,797,000.
Area: 18,816 square miles; 48,734 square kilometres.
Population density: 149 per square mile; 57 per square kilometre.

Summary of school statistics, 1953–57. Information for the school year 1957/58 is incomplete. Enrolment in primary and secondary schools, except teacher training schools, was about 464,500 pupils in 1956/57, representing nearly 18 per cent of the population. The proportion of girls in primary and general secondary schools in 1956/57 was about 50 per cent, in secondary technical schools 60 per cent and in teacher training schools 85 per cent. No data are available on the number of teachers and pupil teacher ratios at any level of education. There appears to have been a striking increase in primary enrolment of nearly 84 per cent between 1953/54 and 1957/58. On the other hand, enrolment in general secondary and teacher training schools in 1956/57 was 10 per cent lower than at the beginning of the period under review. (See Table 1.)

Enrolment trends in secondary education, 1936–56. Average enrolment in general and vocational secondary education trebled over the period under review. The ratio of secondary enrolment to the estimated population 15–19 years old rose from 3 to 7 between 1936 and 1956. By 1956, the proportion of girls in secondary education was between 50 and 60 per cent. (See Table 2.)

Examination results in secondary education. In 1954, the only year for which data are available, some 2,072 *bachillerato* diplomas and teaching certificates were awarded.

Educational finance, 1957. In 1957, the budget for educational expenditure amounted to 11,537,433 pesos. (Official exchange rate: 1 Dominican peso = 1 U.S. dollar.) Of this amount, the Department of Education had at its disposal the sum of 10,002,922 pesos. The balance of 1,534,511 pesos was expenditure for construction and included 762,645 pesos for the building of the Secretariat for Education and Fine Arts.

ECUADOR

THE EDUCATIONAL SYSTEM

The political constitution now in force, promulgated on 31 December 1946, contains the following provisions relating to education:

Article 134. Preference shall be given in the Budget to National Defence and Public Education.

Article 171. Children's education is primarily the responsibility and prerogative of their parents or of those representing them. The State shall ensure that such responsibility is discharged, and shall facilitate the exercise of that prerogative. Education and instruction, in conformity with the institutions of the Republic, shall be free. Municipalities may subsidize free private education. Such subventions shall not exceed 20 per cent of the amount approved for education. When the Government considers it appropriate to grant assistance, it must secure the approval of the Council of State. Primary and technical education in public establishments shall be free; primary education either in public or in private establishments shall be compulsory. School welfare services shall be provided without discrimination, in all free establishments, both public and private, for the benefit of all pupils who may need them. At all levels of education, special attention shall be devoted to the pupils' moral and civic training. In both public and private schools, special attention shall be given to Indian pupils. All teachers in the country, whether serving in public or private schools, shall be represented on the national governing bodies for education. All state education, whether under the responsibility of the Central Government or of the provincial or municipal authorities, shall be secular—that is, the State as such shall neither teach nor attack any religion. The State shall respect the right of parents or those representing them to give their children the kind of education they deem most appropriate.

Article 172. The universities, both state and private, shall be autonomous. To make such autonomy effective for the state universities, the law shall favour the building-up of university endowments.

Article 173. The State shall establish and maintain special institutions for free training in the arts, crafts, commerce, agriculture and other kinds of remunerative work, such training also to include education in ethics and civics. In primary and secondary schools, pupils' aptitudes for various kinds of work shall be cultivated in special sections providing a practical education. In public establishments for primary education and training in the arts and crafts, the State shall provide pupils in need of them with items of equipment essential for their training.

Ethnic, linguistic, social, cultural, religious and other factors affecting the provision of education. The population of Ecuador has several ethnic components varying in distribution according to the part of the country, which comprises three natural divisions: Coast, Mountain and Eastern Region. The language of the country is Spanish. But the Indians, who make up over half of the population, speak Quechua, with the exception of those in the Eastern Region, who live in their own fashion and speak their own languages.

The structure of the school system is shown in the diagram on page 435.

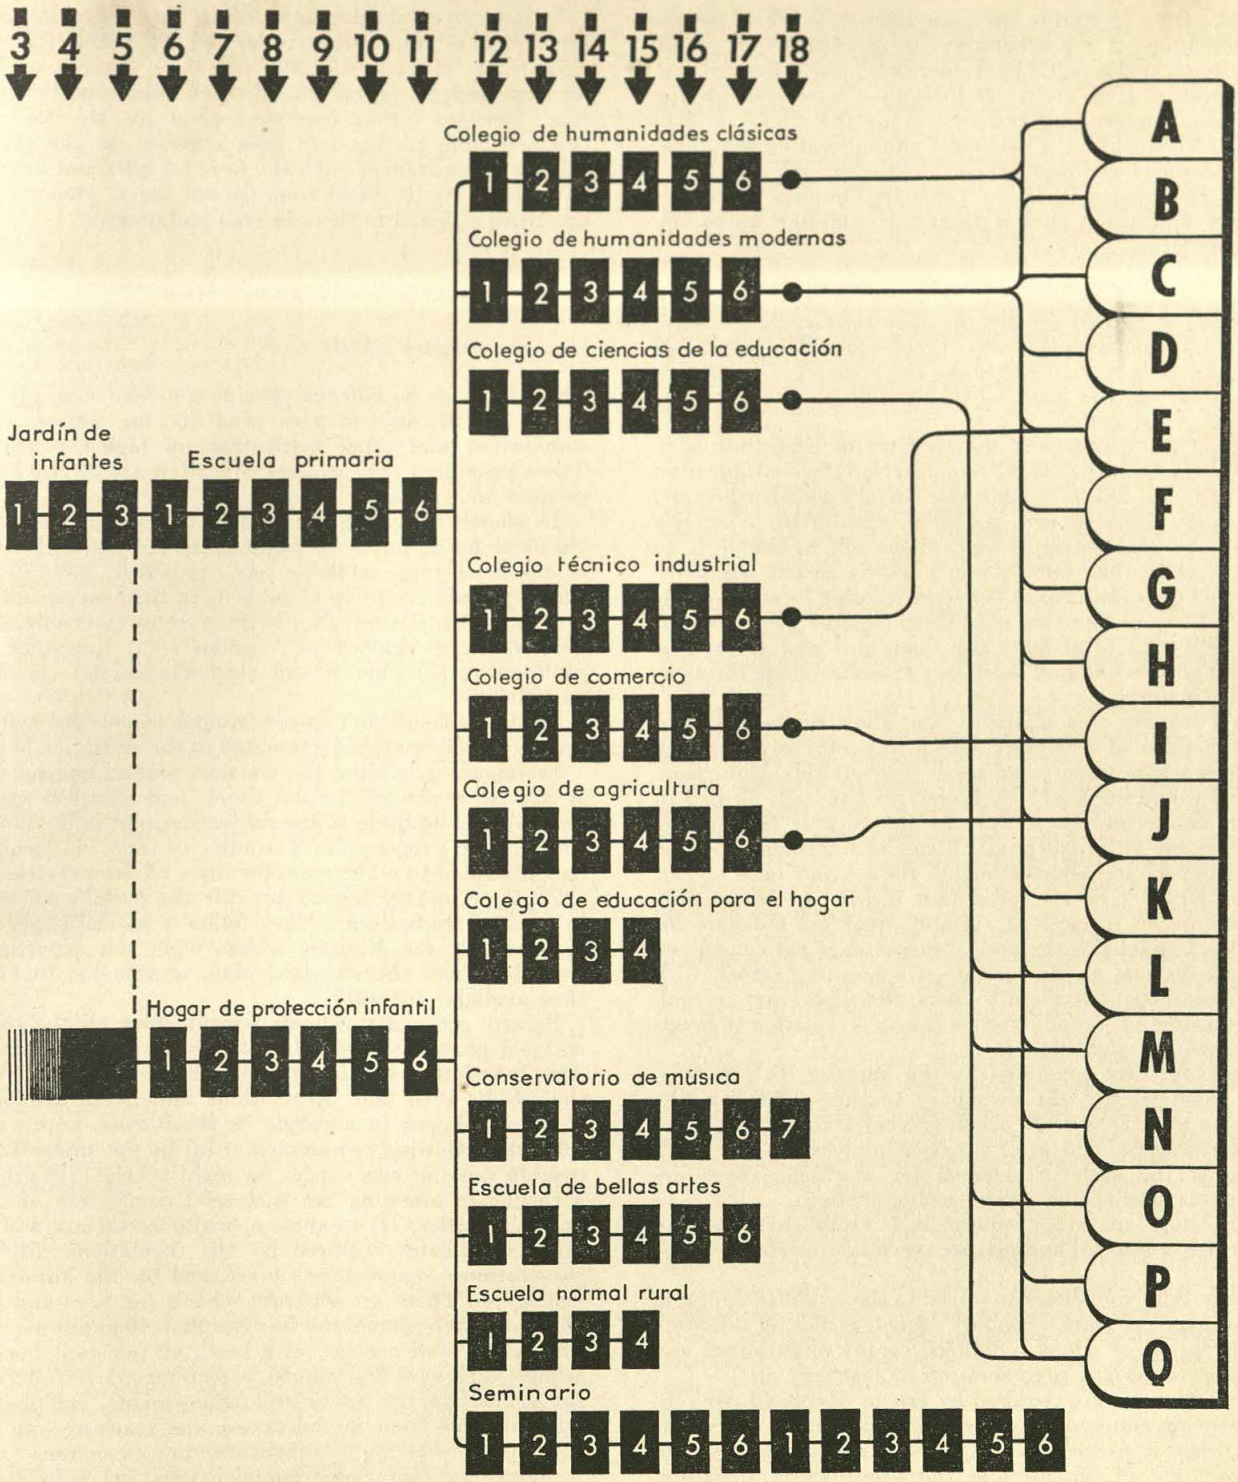
THE DEVELOPMENT OF SECONDARY EDUCATION

Secondary education dates back to 1 June 1897 when by decree of the Constituent National Assembly the Colegio Mejía was founded to provide both primary and secondary education and primary teacher training.

The present Organic Law on Secondary Education was ratified by the Constituent National Assembly in August 1946. Ten of its sections relate particularly to the objectives of secondary education, the organization of secondary schools, the duties and responsibilities of the authorities and teaching staff, the school system, private establishments and the medical service.

The first article of the Organic Law defines secondary education as 'that given to adolescents who, on completion of primary education, go on to *colegios de bachillerato* (preparing for the secondary school leaving certificate), vocational training schools and rural teacher training establishments. Its basic objective is the balanced all-round development of the adolescent's personality by discovering and channelling individual aptitudes. It will therefore equip students to make the best use of the knowledge, experience and habits acquired during their years of study, so that they may be of use to themselves and to their country as a member of the community of nations. It will also prepare them for higher studies.'

The *colegios de bachillerato* include general secondary schools with modern and classical courses, teacher training schools (*colegios de ciencias de educación*) and technical schools.



Technical education is governed by General Regulations dated 29 December 1947. It is under the control and direction of the following bodies: the Ministry of Education, the Advisory Council on Technical Education, the Directorate of Technical Education. The Advisory Council on Technical Education keeps the Ministry of Education and the Directorate of Technical Education informed of the needs of industry and of the most suitable direction to be given to technical education services. The Council is composed of the following: the Minister of Education; the head of the Technical Department of the Ministry of Education; the Technical Education Adviser of the Ministry concerned; a representative of the Ministry of Economics; a representative jointly designated by the Chambers of Industry, Commerce and Agriculture, the Rotary Club and the Lions' Club of Quito, and another

GLOSSARY

colegio de agricultura: vocational secondary school of agriculture.
colegio de ciencias de la educación: teacher training school.
colegio de comercio: vocational secondary school of commerce.
colegio de educación para el hogar: vocational training school of home economics.
colegio de humanidades clásicas: general secondary school with curriculum including Greek and Latin.
colegio de humanidades modernas: general secondary school with curriculum offering a choice in final year of study between (a) literature and philosophy; (b) mathematics and physics; (c) chemistry and biology.
colegio técnico industrial: vocational secondary school for industrial occupations.
conservatorio de música: vocational training school of music.
escuela de bellas artes: vocational training school of fine arts.
escuela normal rural: teacher training school for primary teachers in rural districts.
escuela primaria: primary school.
hogar de protección infantil: an institution for homeless or delinquent children combining a *casa cuna* institution (for infants under 3 years of age), *jardín de infantes* (see below) and *reformatorio* (reform school covering the primary course).
jardín de infantes: pre-primary school.
seminario: vocational college for the priesthood.

representative elected in the same manner by these bodies in Guayaquil; a representative of the Confederation of Ecuadorian Workers (CTE). Under the General Regulations the Directorate of Technical Education is responsible for organizing, supervising and controlling the whole service. The Director is assisted by a chief administrative secretary, an inspector of technical schools, and other officials.

The law on compulsory schooling applies solely to primary education, that is to say, to children up to the age of 12 years.

Supervision and inspection. The supervision of secondary education is carried out by the Director-General of Education and the secondary school inspectors. The inspectors are responsible to the Head of the Department of Secondary Education who, in turn, is responsible to the Director-General of Education.

One of the concerns of the Ministry of Education is to provide the Department of Secondary and Higher Education with a corps of suitably qualified secondary school inspectors, to keep it informed with regard to each of the country's secondary establishments and, above all, to enable it to help them in their educational work by specific guidance and directives. It has not yet been possible to achieve this object, because there are only three regional inspectors for a commitment of at least two visits per year to each of more than two hundred secondary establishments throughout the country.

To overcome this difficulty, the Ministry has assigned the functions of secondary school inspector to secondary teachers whose talents and merit warrant this distinction. In this way a corps of four inspectors has been formed to cover the secondary schools in the Sierra; though the numbers are still inadequate, it has at least been possible to visit every secondary school in the country once a year.

The Ministry is convinced that it will not be possible to secure the services of suitably qualified teachers for this work so long as the post of inspector is not considered as a promotion, as the summit of a teaching career, with appropriate remuneration to mark the superiority in rank of inspectors of secondary schools even in relation to heads of secondary establishments.

Inspectors are appointed by the Minister. In principle, they must possess the secondary teacher's diploma, the diploma awarded by the urban teacher training schools or the *bachillerato*, and have attained at least to the sixth grade of the scale established for teachers. There are inspectors specializing in physical education.

Inspectors of state educational establishments also supervise municipal and private secondary establishments.

Finance. All expenditure involved in the establishment and maintenance of state secondary schools is met by the State (construction of school buildings, supply of furniture and teaching materials, remuneration of teachers, etc.).

Municipalities are required by law to devote 15 per cent of their revenue to education, and in many cases this percentage is exceeded. The provincial councils assist in the building of schools and the provision of furniture. Education in state secondary schools is not free; parents have to pay certain enrolment, examination and diploma fees.

Secondary establishments derive their revenue from: (a) the yield from property owned by them; (b) sums allocated to them by the State by laws, decrees, and the national budget; (c) enrolment, examination and diploma fees, and any other fees prescribed by the Ministry; (d) forfeitures of pay and fines imposed on the staff of schools in accordance with the law; (e) gifts and bequests to schools; (f) the yield from special taxes, property and annuities assigned to them in laws and decrees.

TYPES OF SECONDARY EDUCATION

General secondary schools

The *colegios de bachillerato* provide a 6-year course in two cycles (4+2) and prepare students for admission to universities and other institutions of higher education. Those providing only general education are of two types: modern and classical.

In schools providing the modern course, the syllabus is the same for all pupils throughout the six years. However, in the final year, students have to select, according to their aptitudes, a group of subjects in the general syllabus for more exhaustive study. For this purpose three specialized groups are recognized as 'options': (a) literature and philosophy; (b) physics and mathematics; (c) chemistry and biology.

In girls' schools and co-educational schools the syllabus includes additional subjects suited to the education of girls.

In schools providing the classical studies course, there is special study of Latin, Greek and classical culture generally, in addition to the subjects taught in the modern course. The programme of studies is thus the 'modern' one, amended to make room for these additional items.

Night secondary schools provide the *bachillerato* course in modern studies only. They follow a special study plan approved by the Ministry which, while not departing in essentials from the standard plan, is adjusted to fit the time available for work.

Private secondary schools benefit from all the constitutional guarantees and, like the State schools, have to comply strictly with the prescriptions of the Organic Law, the Study Plan, the Regulations and State syllabuses.

For enrolment in a *colegio de bachillerato*, pupils must fulfil the following requirements: (a) be not under 12 nor over 16 years of age, except for night schools; (b) produce a certificate attesting the successful completion of the 6 primary grades; (c) produce a health certificate and any other certificates required by the regulations; (d) pass the entrance examinations prescribed by the Ministry of Education. There are separate schools for boys and girls. Normally there should not be more than 40 pupils per class. The school staff consists of a head, an assistant head (in schools with over 800 pupils), a secretary, a bursar (when the school has to administer endowments, buildings or funds derived from special taxes), and teaching staff with permanent, 'acting', substitute or temporary rank, technical assistants, superintendents and other employees.

Teaching staff. A permanent teacher is one who possesses the qualifications required by the Law on Grades and

Total	32	32	32	32	32	32	32	32	32	32	32	32

1. 'Unallocated' time can be used by the governing board for purposes which may include the following: (a) providing an extra period or periods for a subject or subjects in the prescribed grade syllabus; (b) providing a period for a complementary subject or activity; (c) art work, etc; (d) practical workshop or agricultural training; (e) literary or scientific discussion groups; (f) typing and shorthand practice; (g) social activities; (h) sports. In girls' schools the unallocated time, including 4 hours for the sixth grade, is reserved mainly for domestic economy courses.
2. The optional groups are: (a) literature and philosophy; (b) physical and mathematical sciences; (c) chemical and biological sciences.

Salary Scales of Teachers, and has been appointed by the Ministry in a permanent capacity.

A teacher may be 'acting' on two grounds: either because he is serving a probationary period under Article 34, or because he is occupying a post in a category higher than his own in the scale established for teachers.

A substitute teacher is one replacing a permanent or 'acting' teacher during the latter's temporary absence on leave or because of suspension. A temporary teacher is one filling a vacant post on a purely temporary basis.

Each secondary school has a governing council consisting of the head, the assistant head and three teachers, a committee of senior staff and teachers and a committee of class teachers with special duties.

Teachers in private establishments must possess the same professional qualifications as those required in State schools. The Ministry may, however, concede equivalence with the secondary teachers' qualifications for the internal teaching qualifications conferred by religious institutions, when the holders have long experience in education and teaching, and particularly when they have pursued higher studies.

Vocational and technical schools

Vocational and technical schools are national, municipal and private.

Secondary technical education is provided by *colegios artesanales* (training schools for artisans) and *colegios técnicos* (technical schools).

The artisans' training schools award skilled worker certificates (*titulo de prácticos*) after 3 years of study and 1 year of practical work.

Technical schools may specialize in: industrial education; commercial education; education in domestic economy; agricultural education.

Technical schools for industrial education grant the following certificates: *práctico* (3 years of study and 1 of practical work) in the following branches: iron-working, sanitary installations, electrical installations, carpentry, tailoring and boot making; *maestro industrial* (4 years of study and 1 of practical work) in the following branches: industrial mechanics, automobile mechanics, electricity, broadcasting (wireless telegraphy and assembly of radio apparatus), graphic arts, cabinet making and wood carving; *bachiller industrial* (6 years of study and 1 of practical work) in the following: mechanics, electricity, radio technology, graphic arts. In 1957, there were 14 schools of this type. The year of practical work is carried out and supervised in the school and in industry.

Technical schools for commercial education grant the diploma of *auxiliar de oficina* (office assistant) (3-year course) and the following certificates: *secretario-taquigrafo* (secretary-typist) (5-year course) and *bachiller perito contador* (expert accountant) (6-year course). In 1957, there were 74 schools of this type.

The home economics schools grant certificates for teachers of cutting, sewing, weaving, etc. (4-year course). In 1957, there were 26 schools of this type.

Farming schools (6-year course) grant the certificate of *bachiller técnico* in the agricultural sciences. In 1957 there were 2 schools of this type.

In 1957 there were in all 116 technical schools (including academies and institutes).

There are in addition 2-year accelerated courses for skilled workers, and shorter optional courses for certain specialities based on two years spent in secondary schools. Thus all individuals are given the opportunity to improve themselves in accordance with their ability, means and desires.

The conditions for admission to vocational and technical schools are as follows. For the first course in a training school for artisans a pupil must have completed primary school, be at least 12 years of age and submit a satisfactory medical certificate. Pupils who have completed the third year of the artisans' training school may enter the third year of technical school. Pupils from the second and third years of the humanities who have received good grades and those from the fourth year may enter the second year of technical school.

The examinations are quarterly. The final quarterly mark is the average of the grade in the examination and that given for progress shown during the quarter.

At the end of the last year of study pupils must, in order to obtain a diploma, show proof of the stage they have reached in subjects related to the occupation; and after completing the supervised period of practical work, they must take examinations in design, technology and practical work in the workshop.

During the practical work year, the pupil must prepare a theoretical and practical thesis covering his experience in the industry in order to obtain his diploma of *bachiller-técnico*. As soon as the thesis has been accepted by the commission, the pupil must appear before a board of examiners to discuss the thesis; the board of examiners then awards marks and grants a diploma.

Industrial education. Further details about this branch of vocational and technical education are given below.

Resolution No. 575 of 30 September 1955 specified that industrial education should have the following general purposes: canalization of individual interests and aptitudes (development of vocational guidance, promotion of creative ability); ethico-professional and aesthetic training (encouragement of habits of work, cultivation of the sense of responsibility, affirmation of individual duties and rights, cultivation of aesthetic feeling); and civic and social training (development of the spirit of tolerance, promotion of solidarity and co-operation, respect for human dignity, preparation for democratic life).

Specific purposes were defined as follows: (a) training and preparation of personnel to meet the industrial needs of the country; (b) development of technical procedures in order to improve the quality of production, reduce costs and prices and raise the standard of living and culture; (c) training of skilled workers in employment in new methods and technical procedures; (d) promotion of better relations between capital and labour; (e) co-operation with a view to the better development, use and conservation of Ecuadorian natural resources.

Technical subjects taught in the 3-year artisan training schools include geometrical, free-hand and technical drawing, and a course on industrial occupations and workshop technology and practice. The ratio of hours per week devoted to general and technical subjects respectively in each of the 3 years is 20:18; 19:21; 15:25.

In the technical schools the technical subjects taught in the first 2 years are the same as those in the artisan training schools. In the third and fourth years students choose one of the specialized sections shown in the following time-table.

Students who successfully complete this stage are admitted to the 2-year course for *bachilleres-técnicos*.

Teacher training schools

Rural primary school teachers are trained at the rural teacher training schools.

There are 10 co-educational rural teacher training schools and one institution for girls. The rural teacher training school at Uyumbicho has been conducted as an experimental institution since October 1956. As organized at present the course includes a 6-year cycle, whereas the other rural teacher training schools comprise only a 4-year course on completion of primary school. They confer a diploma of *maestro rural* (rural schoolteacher). These schools try to give future rural teachers a preparation which is in accordance with the needs of life in the country, by studying the natural environment and the problems of the community. The purpose is to embody these essentials in the educational programmes of the schools so that the schools will make a positive contribution towards the establishment of a better bond between man and his native soil and raise the cultural level of society.

Urban primary teachers are trained in the *colegios normales* which grant the diploma of *bachiller* in the educational sciences. These are secondary schools (13 are official and 8 private) with a 6-year course on completion of primary school. The first four years are similar to the

modern studies course. During their fifth and sixth years, the future urban school teachers intensify their study of educational sciences and practise teaching.

The qualifications required of a teacher in a teacher training school are the same as those for secondary school-teachers. In making appointments, the Ministry considers qualifications as far as possible in the following order: (a) qualification as secondary school teacher (4 years of university studies); (b) university degree; (c) diploma of *bachiller* in educational sciences; (d) other *bachillerato* diplomas. Teaching work is also taken into account.

Other specialized schools

Schools of fine arts are attached to the Universities of Quito and Cuenca. They cover a 6-year course after the primary school.

Schools of music are attached to the Universities of Quito, Cuenca and Guayaquil. The course lasts 7 years. Pupils are admitted upon attaining the age of 12 years.

The lower seminaries cover a 6-year course on completion of primary schools and are conducted by the religious authorities.

The Ministry of Defence maintains a military college which grants the diploma of *bachiller* of modern studies.

The Ministry of Economics maintains a school of agriculture.

The Ministry of Social Welfare has a social welfare school to train social workers. The course lasts 3 years subject to completion of the second year of secondary school.

STATISTICS

Population (mid-year 1958 estimate): 4,007,000.
Area: 104,506 square miles; 270,670 square kilometres.
Population density: 38 per square mile; 15 per square kilometre.

Summary of school statistics, 1953–57. In 1957/58 enrolment in all educational institutions (including some night schools at the primary level) totalled 572,500, representing about 15 per cent of the estimated population, as compared with 13 per cent in 1953/54 (see *World Survey of Education*, II). The increase in school enrolment at every level was more marked during the period 1953–57 than between 1950 and 1954. Thus, primary school enrolment increased 26 per cent between 1953 and 1957; secondary schools, 40 per cent; and higher education, 30 per cent.

Of the school-going population in 1957, 90 per cent was in pre-primary and primary schools, 9 per cent in institutions at the secondary level, and 1 per cent in higher education. The proportion of girls was 47 per cent in primary schools, 28 per cent in general secondary schools, 69 per cent in vocational schools, 56 per cent in teacher training schools, and 20 per cent in institutions of higher education. In general, the proportion of girls was higher in private schools than in public schools. Women teachers constituted about 55 per cent of the teaching staff. (See Table 2.)

Enrolment trends in secondary education, 1938–57. From Table 3, it appears that enrolment in secondary schools more than doubled between 1948 and 1957. However, the ratio obtained by relating average enrolment to the estimated population 15–19 years old shows an increase of about 50 per cent over this period. In view of the large number of pupils enrolled in primary schools, it may be expected that secondary enrolment will increase even more rapidly in years to come.

Examination results in secondary education, 1953–57. Between 1953 and 1957 the number of secondary school leaving certificates granted showed an increase of 36 per cent, though this is less than the increase in general secondary school enrolment (46 per cent) over the same period. The number of vocational and rural normal school certificates changed little during these years, but the number of urban teacher training school certificates showed a considerable increase. (See Table 1.)

Educational finance, 1957. In 1957 (fiscal year beginning 1 January) total expenditure for education amounted to 200 million sucres, averaging 52 sucres per inhabitant, as compared with 37 sucres per inhabitant in 1953 (see *World Survey of Education:* II—*Primary Education*). Of this total, 72 per cent came from the Central Government, 12 per cent from provincial authorities and the rest from tuition fees, donations and other sources. Recurring expenditure represented 96 per cent of the total expenditure. (See Table 4.)

2. Includes data from closed account and from budget estimates.
3. The distribution includes recurring expenditure of 193,034,082 sucres and capital expenditure of 7,302,084 sucres.

THE EDUCATIONAL SYSTEM

The Constitution of 7 September 1950 contains the following references to education:

'Education is an essential attribute of the State, which shall organize the educational system and establish such institutions and services as may be necessary.' (Article 197.)

'Education must aim at developing the full potentialities of the students' personalities so that they may co-operate constructively with the community. It must inculcate observance of the rights and duties of man, combat all attitudes of intolerance and hatred, and promote the ideal of the unity of the Central American peoples. There must be organic continuity between all levels of education, which shall embrace intellectual, moral, civic and physical training.' (Article 198.)

'All inhabitants of the Republic have the right and the duty to receive such basic training as shall fit them to play their parts conscientiously and effectively as workers, parents and citizens. Basic training shall include primary education which, in state schools, shall be free of charge.' (Article 199.)

'Literacy training is in the public interest. All inhabitants of the country shall contribute to it in such form as may be prescribed by the law.' (Article 200.)

'Education given in public establishments shall be secular. Private educational establishments shall be subject to regulation and inspection by the State. The State may assume exclusive charge of the training of teachers.' (Article 201.)

'No educational establishment may refuse admission to a pupil on the grounds of irregularity in the marital status of his parents or guardians, or on the grounds of class, race or political beliefs.' (Article 202.)

'The right to engage in teaching shall be subject to proof of capacity in such form as the law may prescribe. In all educational establishments, public or private, the teaching of history, civics and the Constitution must be given by teachers who are Salvadoreans by birth. Freedom of teaching is guaranteed.' (Article 203.)

'The University of El Salvador shall be autonomous with respect to teaching, administration and finance, but it must perform a social service. It shall be governed by statutes based on a law establishing the general principles for its organization and operation.

'The State shall assist in providing and increasing the university's assets and shall annually include in its budget items for the university's maintenance.' (Article 205.)

Departments, agencies and institutions coming under the Ministry of Culture (*Ministerio de Cultura*) include: (a) the State Secretariat; (b) the Under-Secretariat; (c) the Technical and Planning Section; (d) the National Council of Education; (e) the Central Administrative Office (*Oficialía Mayor*) and the administrative departments; (f) the technical departments, including the four directorates-general (primary education, teacher training, secondary education and physical education); (g) the cultural departments and the educational extension department; (h) educational institutions and centres: autonomous cultural institutions, the School of Rhetoric, the Higher Teacher Training School, state, municipal and private schools and state institutions providing special education.

The structure of the school system is shown in the diagram on page 445.

THE DEVELOPMENT OF SECONDARY EDUCATION

The Law of 29 April 1825 established a *colegio* (general secondary school). Some of the earliest institutions were the Colegio Aurora del Salvador, which operated in the capital between 1832 and 1844, a school of philosophy established in Tecapa (now the city of Alegría) in 1837, a Latin grammar school at Suchitoto in 1839, and *colegios* at Sosonate and San Miguel in 1841. By the Decree of 16 February 1841 the National Constituent Assembly founded the Colegio de la Asunción and the National University. The Executive Decree of 7 February 1885 created the National Institute at San Salvador, which was followed a few years later by the opening of institutes at Santa Ana and San Miguel. At present there are 15 national institutes (state secondary schools).

In 1949 the present Directorate-General of Secondary Education was established; it controls the first and second stages of general secondary education, and commercial education.

Legal basis

Secondary education is governed by the following decrees and regulations:

The Executive Decree which established the general basic plan stage of secondary education and which was published in the *Official Gazette* (*Diario Oficial*) on 15 March 1947.

The Executive Decree which established the study plan for the evening secondary education sections and which was promulgated on 15 October 1952.

The Regulations governing the admission of pupils to secondary educational establishments, which were published in the *Official Gazette* on 1 December 1950 and replaced those published in the *Official Gazette* of 11 December 1947.

The Executive Decree instituting term examinations for the promotion of students taking the upper secondary course for the *bachillerato* (secondary leaving and pre-university certificate) in science and letters and published in the *Official Gazette* of 3 July 1946.

The Regulations concerning term examinations, published in the *Official Gazette* of 14 August 1946.

The Executive Decree concerning equivalence of teacher training and studies for the *bachillerato* in science and letters, published in the *Official Gazette* of 28 March 1947.
The General Regulations governing secondary education, established by Executive Decree of 12 September 1956.
The Regulations concerning examinations for the *bachillerato* in science and letters, published in the *Official Gazette* of 2 July 1958.

Administration

The Directorate-General of Secondary Education comprises an administrative section, and a technical section; the first consists of the Director-General, his assistants, the inspectors and the secretariat; the second has offices for the basic general course and the upper or *bachillerato* stage of the secondary course, vocational and educational guidance, industrial arts, audio-visual aids, handicrafts and small industries.

The duties of secondary school inspectors are of three kinds—professional, administrative and litigious. They exercise control not only over the national institutes and secondary education sections, but also over private schools. Inspectors must hold the teacher's diploma of the Higher Teacher Training School or of the University of El Salvador, or must be certificated teachers or *bachilleres* in science and letters with at least three years' experience in education, two of which must have been spent in administrative posts dependent on the Ministry of Culture.

TYPES OF SECONDARY EDUCATION

General secondary schools

As defined by the General Regulations for Secondary Education, established by the Decree of 12 September 1956, the aims of secondary education are: (a) to complete the education begun at the primary school; (b) to promote the development of the pupil's personality with due regard to the career he intends to take up; (c) to prepare citizens for intelligent and co-ordinated co-operation in the task of promoting social and national progress; (d) to train pupils for higher and technical education. Secondary education 'must assume responsibility for technical development, increased productivity, and the establishment of just and harmonious relations between all Salvadorean citizens; promote the ideal of Central American and continental unity with a view to the permanent defence of democracy and respect for fundamental human values'.

Secondary education is organized in two stages: the basic general course (*plan básico*) comprises three years of study and leads not only to the 2-year upper cycle of general secondary studies, known as the *bachillerato*, but also to commercial studies, teacher training and various vocational courses. The subjects taken in the two stages of the general course are given below; the *bachillerato* provides the necessary training for entry to the University of El Salvador.

GLOSSARY

academia técnica elemental: elementary vocational training school.
bachillerato: upper stage of general secondary course.
colegio: private secondary school.
escuela de agricultura: vocational training school of agriculture.
escuela de artes y oficios: vocational training school of applied arts and crafts; also offers 5-years courses in graphic arts.
escuela de comercio: vocational secondary and training school of commerce; courses for book-keepers (*tenedores de libros*), clerks (*oficinistas*), accountants (*contadores*) and secretaries (*secretarios comerciales*).
escuela de enfermería: vocational training school of nursing.
escuela de la milicia: vocational secondary school for careers in the armed forces.
escuela de párvulos: pre-primary school.
escuela normal rural: teacher training school for rural primary teachers.
escuela normal urbana: teacher training school for urban primary teachers.
escuela primaria: primary school.
escuelas de bellas artes: vocational training schools of art, music, etc., with various types of course.
escuela técnica industrial: vocational training school for industrial occupations.
instituto nacional: state general secondary school.
plan básico: basic course of lower general secondary studies.

HIGHER EDUCATION (university faculties and higher institutes)

A. Law and social sciences (7 years).
B. Medicine and surgery (6 years) and related technical occupations (2 years).
C. Chemistry and pharmacy (5 years).
D. Dentistry (5 years).
E. Engineering (11 semesters).
F. Economics (5 years).
G. Arts (5 years).
H. Education (4 to 6 semesters).
I. Social services (3 years).
J. Armed Forces Staff College (2 years).

Total	28	28

In order to compare pupils' school results and fix criteria for their promotion, examinations are held quarterly in accordance with the aims of the different institutions, the educational methods applied and the appropriate examination technique. For foreign languages (English and French), there are also oral examinations.

The marks awarded range from 0 to 10. A pupil's promotion depends on his average marks for the three terms. He is promoted if he obtains an average of at least 5 marks, provided that his average for the third term is not less than 5: otherwise he must sit for a further examination in January of the following year. If in January he fails in three subjects, he must remain in the same class for another year; if he fails in one or two subjects, he has only to repeat these subjects.

The term examination marks are awarded by the teacher of the subject, whereas marks for the special examination in January are awarded by three examiners appointed by the Ministry of Culture. For the latter examinations, neither the monthly marks nor averages are taken into account. The minimum pass mark is 5.

Teaching staff. Secondary school teachers are trained at the Higher Teacher Training School (*Escuela Normal Superior*), which was established on 22 April 1952. Candidates for teaching posts must: (a) be over 21 and of good behaviour; (b) hold a teacher's diploma or be a staff member of the Higher Teacher Training School or of the University of El Salvador, or be on the register of the Directorate-General of Secondary Education.

Secondary school teachers are classified in three groups—first class, second class and third class according to qualifications. Those in the third class are regarded as temporary teachers. There is no system of automatic promotion for secondary school teachers.

Teachers of the *bachillerato* course are paid three colons an hour; those of the first stage (general basic course) two colons an hour. In the capital, principals of national institutes earn 600 colons a month. Principals of schools or sections providing only the basic general course receive a base salary of 150 colons a month, and are entitled to supplement this sum by giving lessons.

Under the Pensions Law, passed by the Legislative Assembly on 30 May 1930, secondary school teachers are entitled to pensions.

Educational and vocational guidance. Educational and vocational guidance was introduced into El Salvador, on an experimental basis, in 1953. The centre chosen for experimentation was the Secondary Education Section at Quezaltepeque, a town about 20 miles from the capital. In 1954 the Educational and Vocational Office was established, attached to the Directorate-General of Secondary Education. In 1955, the Quezaltepeque experiment was extended to the towns of Armenia, Ilobasco, Chalchuapa and Metapán. In 1956, general regulations concerning secondary education included paragraphs giving authority to the Director-General to adopt the criteria and procedures for an appraisal of each pupil's school progress and personality', and 'gradually to extend educational and prevocational guidance to the entire system of secondary education'.

Educational and vocational guidance is designed to help pupils solve their problems, including that of the choice of a career. For that purpose, it has recourse to recognized techniques for studying the pupil's personality, individual and collective guidiance and the service which seeks employment for pupils and follows their post-school activities.

Until 1956 this guidance was provided exclusively at the first stage of secondary education, in schools called 'basic guidance course schools' (*planes básicos de orientación*). Schools of this type are organized as follows.

During the first two years, the same subjects are taken by all pupils; during the third year, pupils are offered a choice between three courses—scientific, literary and pedagogical, vocational and technical—according to their interests, aptitudes and financial circumstances, as ascertained during the first two years.

This organization is explained by the fact that, in El Salvador, many students are unable, for one reason or another, to pursue vocational or higher studies, and others must work in order to be able to pay for their education. The basic guidance course schools take this into consideration and pupils are taught subjects which qualify them for a particular occupation; e.g. typing (multicopying), intensive workshop practice and agriculture and cattle-raising, elementary educational science, commercial Spanish and mathematics applied to accountancy, laboratory work (physics and chemistry), domestic science, etc. Further, the scientific course prepares pupils for the *bachillerato;* the literary and pedagogical course, for the urban teacher training schools and the institutes of science and letters; and the vocational and technical course, for the school of agriculture and for commercial studies.

Under this system each teacher acts as a guide and adviser to the pupil, and a study is made of each pupil's personality; at present, this study begins in grade 6 of the primary school and comprises family history, school progress, results of psychological tests, teachers' observations of the pupil's artistic and scientific propensities,

conduct, etc.; autobiographical information, medical examinations, results of inquiries and interviews. The cumulative index card sums up almost all the above-mentioned material, which is kept in individual record books.

The Educational and Vocational Guidance Office has begun to co-operate with 12 more institutions: 7 secondary education sections (first stage), 4 national institutes (second stage) and a women teachers' training school.

The only condition of admission to the basic guidance course schools is the certificate of grade 6 of the primary school.

Teachers of basic guidance course schools are mostly young and are carefully selected. They are required to have attended three summer courses before their appointment and they also receive regular advice from their respective principals and from the Directorate-General of Secondary Education through the Educational and Vocational Guidance Office.

Since 1955, a course on guidance has been provided at the Higher Teacher Training School for all pupils, irrespective of their speciality; since 1957, the same course has been given at the Department of Psychology of the Faculty of Humanities.

Vocational and technical schools

Training for industries, arts and crafts. In 1955, the Government included in the Law relating to the Budget and Salaries of the Republic appropriations enabling the Institute of Technical Education to be incorporated in the national educational system. The task of this institute is to train a sufficient number of fully qualified persons to meet the needs of the various branches of national industry. The general study plan already covers the following fields: building, carpentry and cabinet-making, ornamental mechanics, general mechanics, radio mechanics, electricity, motor mechanics. The institute plans to organize progressively courses in the following subjects: diesel engine mechanics, air-conditioning, refrigeration, factory-made clothing.

In accordance with the present plan of organization (experimental), industrial education comprises the following four co-ordinated stages:

First stage: pre-vocational. This takes place during the first 3 years of the basic guidance course, pupils being made familiar with the various industrial arts. No specialized training is given at this stage, but the pupil is initiated systematically, in turn, in various handicrafts. The second stage (vocational) is also open to pupils who have completed their primary education; in this case, they are given a 1-year transitional course of initiation in different industrial activities.

Second stage: vocational. During this stage, which lasts 3 years, pupils receive systematic practical and technical training. The first year is devoted chiefly to exploratory work and adaptation so that the following two years can be reserved exclusively for specialization. Teaching is given at the lower secondary level. At the end of the 3-year course, the pupil receives a certificate indicating that he has completed his vocational training for industrial work. The reports drawn up by the industrial firms with which the pupil comes into contact during his period of training determine the moment at which he receives the qualification of skilled worker (*oficial vocacional*) in his chosen field.

Probable third stage: technical. This stage will comprise a 2-year course at upper secondary level, and will be designed to train experts or technicians. Successful completion of this course of scientific studies and laboratory work in chosen crafts will entitle them to the *Certificado de Bachiller Vocacional* (pre-university vocational certificate) and will give them access to university technical faculties. In the meantime, they will be capable of performing duties (direction, organization, supervision and management) in industrial enterprises.

Probable fourth stage: university technical. According to the pre-established plan already in operation at the first two stages, technical and industrial studies will be completed at this fourth stage. The diploma to be conferred will be determined by the study plan and its application by the teachers, as well as by the research, experimental work and scientific studies undertaken during this stage.

Other institutions providing industrial and technical courses are the Escuela Nacional de Artes y Oficios (National School of Arts and Crafts) and the Colegio Santa Cecilia. The former confers diplomas for draftsmen and artists, draftsmen and architects, photo-engravers, lithographers, commercial drawing. It is open to pupils who hold the certificate of grade 6 of the primary school. The courses last 4 years, except in lithography and photo-engraving, which last 5 years. The Colegio Santa Cecilia, a private school, provides various courses for pupils who have completed grade 6 of the primary school, and confers a specialized worker's diploma at the end of the 5-year course.

Agricultural education. The School Gardening Section was established in 1946 and was later transformed into the Department of Agricultural Education. Its activities may be summed up as follows: (a) it provides various primary schools and basic general course schools with the materials necessary for the teaching of agriculture; (b) it guides and supervises institutions applying programmes relating to the teaching of agriculture; (c) its staff has trained the teachers of agriculture employed at the basic guidance course schools; (d) in 1956, it held a special summer course for teachers of schools at different educational levels; (e) it has obtained fellowships for the best teachers of agriculture so that they may continue their studies abroad.

The Ministry of Agriculture maintains a National School of Agriculture for pupils who have completed their lower secondary studies (basic general course).

Commercial education. The specific aims are: (a) to provide pupils with training corresponding to their vocational aptitudes; (b) to train accountants for posts in the governmental, commercial and industrial fields; (c) to inculcate in pupils a social spirit by imbuing them with the principles which determine the ethics of their profession; (d) to develop the pupil's personality so that he may be in a position to meet the requirements of his profession.

Commercial education forms part of vocational education and qualifies pupils for various diplomas including those of accountant and commercial secretary, which

require 3 and 2 years' technical specialization respectively, following on from lower secondary studies (basic general course).

Domestic science education. The Domestic Science Section was established in 1954 and placed under the immediate control of the Directorate-General of Secondary Education.

Its general aims are to provide teachers with training in domestic science so that they will be able to teach this subject, train good housewives, and provide pupils with the necessary knowledge and skill to meet their personal and family needs.

This teaching is provided at the following institutions: the Social Service School and the Higher Teacher Training School (higher educational establishments); Escuela Normal de Maestras España (teacher training school); Instituto Nacional Central de Señoritas (second stage of secondary education); basic guidance course schools (first stage of secondary education); primary schools; mothers' clubs (in certain communities); various private schools.

Teacher training schools

The rural teacher training schools provide a 4-year course of training, following the 6-year primary course, for future teachers in rural primary schools.

The urban teacher training schools provide a 3-year course, following the 3-year courses of the secondary Basic Plan schools, for future teachers in urban primary schools.

STATISTICS

Population (mid-year 1958 estimate): 2,434,000.
Area: 7,700 square miles; 20,000 square kilometres.
Population density: 315 per square mile; 122 per square kilometre.

Summary of school statistics 1953–57. Total enrolment in educational institutions at all levels was nearly 289,000 pupils in 1957/58, representing some 12 per cent of the population. There were, in addition, 31,741 adults, a quarter of whom were women, attending literacy courses. Of the school-going population, under 5 per cent were enrolled in kindergartens, 85 per cent in primary schools, nearly 6 per cent in general secondary schools, 3.5 per cent in technical secondary schools, under 1 per cent in all teacher training courses and 0.5 per cent at the National University. Girls made up 48 per cent of enrolment at primary schools, 41 per cent in general secondary schools, two-thirds of enrolment at secondary teacher training courses and 38 per cent at higher teacher training schools. However, at the National University only 12 per cent of those enrolled in 1956/57 were women. The proportion of girls to total enrolment in primary and secondary education was unchanged compared with the beginning of the period under review. The full time teaching staff at all levels numbered some 9,900 in 1957/58; three-quarters of primary school teachers and nearly one-third of general secondary school teachers were women. The average pupil teacher ratio, excluding part-time staff, was 33 in primary schools compared with 31 in 1953/54; in general secondary schools the ratio was 10 in 1957/58. Compared with 1953/54, enrolment increased at all levels of education and in particular by 39 per cent in primary schools, by 46 per cent in general secondary schools, by over 300 per cent in vocational schools, by 62 per cent in secondary teacher training schools and by 31 per cent at the university. Adults attending literacy course increased by 77 per cent over the period under review. (See Table 3.)

Enrolment trends in secondary education, 1950–57. Table 1 shows the rapid development of all sectors of secondary education since 1950. Over the 8 years under review, enrolment in general secondary schools increased nearly two and a half times and the number of students in vocational and in teacher training schools was three times higher in 1957 than in 1952. The ratio of secondary school enrolment to the estimated population 15–19 years old

passed from 6 over the 5 years 1950–54 to 10 in the 3-year period 1955–57.

Examination results in secondary education 1953–56. Examination results reflect the expansion of secondary education in recent years. Students passing the baccalaureat increased by 43 per cent over 4 years and commercial diplomas more than tripled over the corresponding period. Teaching diplomas awarded increased by 39 per cent between 1953/54 and 1956/57. Information on women candidates for examinations is very incomplete. (See Table 2.)

Educational finance 1959. The budget of the Ministry of Education for 1959 amounted to 30,192,000 colones averaging about 12 colones per inhabitant. (Official exchange rate: 1 colon = 0.40 U.S. dollar.) Of this total 18,689,000 colones, or about 62 per cent, were allocated for primary education. Further details are not available.

3. Included in secondary general education.
4. Not including schools of fine arts.

ETHIOPIA

THE EDUCATIONAL SYSTEM

The Imperial Ethiopian Government maintains a system of primary and secondary education throughout the country. Its schools are open to Ethiopian children without distinction of race, sex, or religion. They form part of a comprehensive system which includes higher education in an increasing number of fields, both academic and technical.

The present system provides for 8 years of primary education in elementary schools, and 4 years of secondary schooling. However, a revised pattern, with 6 years of primary schooling followed by 5 of secondary, is now under consideration and is being tried experimentally in certain selected schools.

The national language, Amharic, with its own script and literature, is used as the language of instruction in the beginning grades of the primary school. English is introduced in the elementary schools and becomes the language of instruction in most subjects, but as more materials are produced it is intended that Amharic should be used at progressively higher levels in the system.

Overall responsibility for the entire school system in the 12 provinces of Ethiopia is entrusted to the Ministry of Education and Fine Arts, but some schools, particularly at the secondary level, are administered by other branches of the Imperial Government. Under the Act of 1950 federating Eritrea with Ethiopia jurisdiction in educational matters affecting Eritrea was reserved to the Eritrean Government.

Mention should also be made of the role of the Ethiopian Church and of various other bodies engaged in educational work. For very many centuries the Ethiopian Church has maintained a vital interest in education, and today it is responsible for an extensive network of schools, mostly at the primary level. Mission effort is largely concentrated on primary education, though there is some activity in the secondary field. Finally, a limited number of private schools provide educational opportunities for Ethiopian as well as foreign children.

Elementary schools maintained by the Ethiopian Government are financed from the proceeds of a local land tax in the provinces and from central treasury funds in Addis Ababa. For secondary and higher education, funds are provided from the National Treasury.

The rapid development of the Ethiopian school system since the liberation of the country in 1941 has been considerably aided by various forms of technical assistance from international organizations and from friendly governments, and by the employment of foreign personnel. With the increasing number of Ethiopian teachers who are becoming available from training schools and colleges within the country and from abroad, foreign teaching personnel are now concentrated mainly in the secondary schools and colleges.

The current structure of the Ethiopian government school system is shown in the diagram on page 453.

THE DEVELOPMENT OF SECONDARY EDUCATION

When Western-type education was formally introduced into Ethiopia some fifty-five years ago, the curriculum was intended to supplement the traditional instruction given in the church schools. The programme was designed to provide selected groups of students with the linguistic and other skills which were necessary to enable Ethiopia to maintain satisfactory relations with other countries. The new schools were largely staffed by foreign personnel, and the curriculum presupposed a thorough grounding in the national tongue and culture. Priority was given to French, while English, Italian and Arabic were optional subjects.

Thus, the first modern schools were of a secondary rather than a primary nature, but their programme was gradually expanded until it covered the key subjects of mathematics, science, history and geography as well as language, and the level of instruction was divided into primary and secondary grades.

In 1935 the development of education was violently interrupted by the Fascist invasion, and since the liberation of the country in 1941 it has been necessary to rebuild the government school system, as an entity, from the earliest grades. There is still close co-operation with church and other schools, and the co-ordination of programmes enables church, mission and private students to enter government schools at a level appropriate to the work they have already done.

In the early days of the introduction of Western schooling and until quite recently, secondary schools were largely concentrated in the capital, the boarding system predominated, and students were automatically eligible to receive full maintenance as well as tuition from state resources.

Today, with the decentralization of schooling, secondary education is provided in the provinces and the boarding establishments are being converted as far as possible to day schools. Needy students and students leaving their homes to enter secondary schools are, however, eligible to receive stipends or maintenance allowances, and these allowances continue to represent a considerable charge upon national funds.

Legal basis

The Act of 1950 federating Eritrea with Ethiopia under the sovereignty of the Ethiopian Crown guarantees the right to education and reserves to the Eritrean Government local jurisdiction in educational matters.

Proclamations, decrees and orders, legal and general notices, are published in Amharic and English in the

official *Negarit Gazeta*. The following is a summary of the main legislation relating to educational matters.

Order No. 1 of 1943. An Order to define Powers and Duties of Ministers. Articles 26–28 relate to the Minister of Education and Fine Arts. Among his functions are: to develop education and the arts; to define the nature of and the curriculum for schools; to issue certificates for the higher standards; to control private educational institutions; to establish an academy, libraries and museums.

Legal Notice No. 103 of 1947, Customs Revised Import and Export Tariff Regulations. Item 350 reads: 'All goods, wares and merchandise imported, whether paying duties, or classed as duty free, shall pay an additional tax of 3 per cent *ad valorem*, for the promotion of education and public health in Ethiopia.' Legal Notice No. 162 of 1952, Revised Import and Export Tariff (Amendment No. 1) Regulations, adds 1 per cent to this tax, making a total of 4 per cent.

Order No. 3 of 1947 established the (central) Board of Education and Fine Arts.

Proclamation No. 93 of 1947 established a tax for education, levied on all lands, and collected as one with taxes provided for by the Land Tax Proclamation of 1944.

Proclamation No. 94 of 1947 constituted a local education board in each province, under the presidency of the Governor-General, and with the senior education officer and the headmaster of the principal school in the provincial capital as *ex officio* members. It provided that the Local Education Tax should be used for expenses in connexion with elementary schools in the province.

General Notice No. 185 of 1954 is the Charter of the University College of Addis Ababa.

Secondary schools are administered in accordance with the regulations which are laid down from time to time by the Ministry of Education and Fine Arts.

Administration

Secondary education is planned and developed by the Ministry of Education and Fine Arts working through its administrative, programming and advisory departments, and under the general direction of the Board of Education appointed by the Emperor.

The control and administration of general secondary education is centralized in the Ministry of Education. Co-ordination with other Ministries and Departments responsible for special schools, and with public authorities and private agencies, is achieved at the working level through the appropriate departments of the Ministry, and on policy matters through the Board of Education.

Supervision and inspection of the general secondary schools is carried out through the Inspections Branch of the Ministry's Department of School Administration. A regular schedule is maintained, and the inspectors' reports cover all aspects of school administration and operation. They are discussed with headmasters and Ministry officials as well as with individual teachers, and they form the basis for necessary directives and guidance.

Headmasters are encouraged to enlist the support of parents in school matters, and this support takes practical form through the activities of parent-teacher associations.

Finance. Secondary education is financed from the National Treasury. Comprehensive budgets, taking into account the needs of each school, are prepared each year by the Accounts Departments of the Ministry of Education and of the other Ministries and Departments which are responsible for the operation of special schools. These budgets are submitted to the Ministry of Finance.

Provincial Education Officers, who are responsible for the supervision and budgetary administration of provincial elementary schools, act also as the Ministry's representatives

GLOSSARY

NOTE. Not shown are the theological secondary, naval and air cadet training schools, all of which prepare candidates for the secondary school certificate. There is provision for in-service technical training in Ethiopia, and study abroad, at both secondary and higher education levels. Official age of entry to primary school is 6 to 7 years.

agricultural school: vocational secondary school of agriculture.

building trades school: vocational training school for carpenters, masons, etc.

civil aviation school: vocational training school for all aspects of civil aviation administration and related technical services (meteorology, aircraft maintenance, communications, etc.).

commercial school: vocational secondary school with course offering academic, secretarial and commercial subjects.

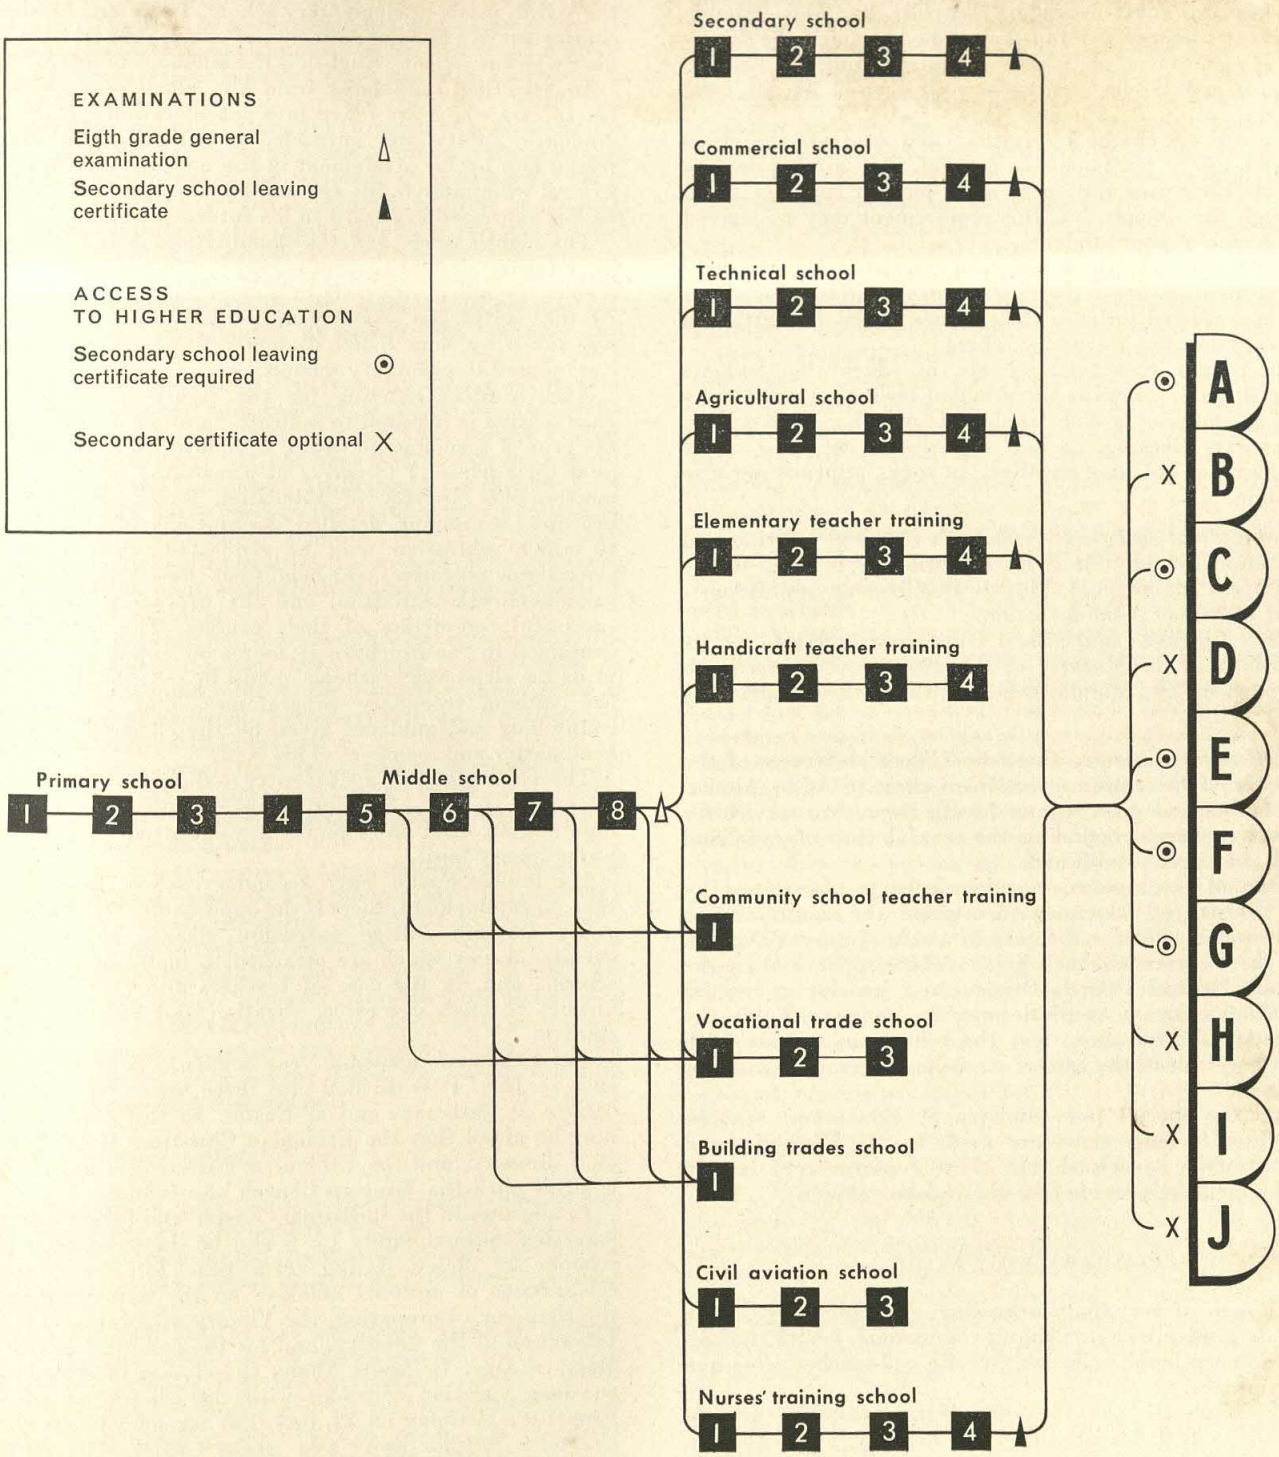
community school teacher training: training course for teachers in schools offering basic education to adults and children.

elementary teacher training: teacher training schools for teachers in *primary* and *middle* schools; in addition to the full 4-year course accelerated 2-year courses are provided.

middle school: upper primary school (grades 5–8).

nurses' training school: training courses at various levels for nurses, dressers, and other auxiliary medical personnel.

primary school: lower primary school (grades 1–4).



secondary school: general secondary school.

technical school: vocational secondary school training technicians for industrial activities.

vocational trades school: vocational training school for various industrial occupations.

HIGHER EDUCATION

A. Arts and Science College.
B. Agricultural College.
C. Engineering College.
D. Secondary teacher education.
E. Law College.
F. Extension College (courses in various general and professional subjects—accountancy, administration, engineering, English, etc.).
G. Public health officers' course.
H. Theological College.
I. Colleges training officers for the various armed forces and police.
J. Building Institute.

in regard to local secondary schools. In Addis Ababa, schools are supervised and maintained through the Ministry's Department of School Administration; in Eritrea, as explained above, education is supervised by the local government.

There is no charge for tuition, and students are given the free use of textbooks. In general, they are required to provide their own stationery or to pay for supplies issued through the schools, but this requirement may be waived in the case of poor students.

Under current regulations, stipends are paid to needy day students living in their home towns, and to all students who are obliged to leave their homes in order to attend a centrally-located secondary school.

Specialized vocational schools, in which the students undertakes to serve the Government for a number of years after graduation, provide free board and lodging, textbooks, stationery, clothing, medical and dental care and travel expenses for the long vacation. In some, stipends are also payable.

Buildings and equipment. Standards of space, lighting and sanitation are prescribed by the Ministry of Education's Architects Department, Health Department and Department of School Administration.

Class furniture and school equipment is issued to its schools from the Ministry of Education, and conforms to the patterns and standards laid down by the departments concerned.

School welfare services. The School Medical Service of the Ministry of Education maintains a clinic in Addis Ababa, and the nucleus of a regular health inspection service for Ministry schools, including the special care of eyes and teeth, has been established.

Each of the regular secondary schools maintained by the Ministry of Education throughout the country has a clinic which is under the care of a school nurse (dresser), and these clinics and their personnel are supervised by the Schools Medical Officer. Dressers are trained at regular vacation courses; medical supplies are issued by the Ministry of Education, and the schools co-operate with local hospitals in the care of students suffering from major illnesses.

For the special (non-Ministry of Education) schools, individual arrangements are made by the Ministries and Departments concerned, but these conform very largely to the facilities provided for the regular schools.

TYPES OF SECONDARY EDUCATION

The types of secondary schooling available in Ethiopia include academic, agricultural, commercial, health, technical and vocational, police and service and teacher education programmes.

The academic and the agricultural secondary schools prepare students for admission to college (higher education); opportunities for college training are also open to outstanding students from other schools, whose programmes are not specifically directed to this end.

Most secondary programmes cover 4 years (grades 9 to 12), and the main selection of candidates is made from the eighth grade of elementary school. There are, however, shorter courses in some branches of specialized training. In nearly all the schools, English is the language of instruction.

In selecting candidates from the elementary schools, the factors which are taken into consideration include the student's ability and aptitude, as shown in his school record and by his attainment in the national eighth grade general examination, his age and physique, and the choice he has expressed in regard to his future career.

The eighth grade general examination includes papers in English, Amharic, mathematics, science and social studies, together with tests in mental and special abilities. At the end of the school year 1958/59, the examination was taken by some 5,469 students, 40 per cent of whom were placed in secondary schools.

Each student entering for the eighth grade general examination is required to indicate, in order of preference, the type of schooling he wishes to follow. To help students (and their parents) to arrive at a reasoned choice in this matter, the Ministry of Education issues each year a brochure containing detailed descriptions of the schools to which admission may be requested, their location, programme objectives, the conditions prescribed for entry, extra-curricular activities, and the prospects opened by successful completion of their courses. The information contained in the brochure is moreover supplemented by visits to elementary schools made by representatives of the various secondary programmes, and by personal counselling and guidance given by the elementary school headmaster and members of his staff.

The usual minimum age for entry to the various vocational schools is 16 years, and for many a medical certificate is required. In most cases pupils are admitted on a strictly probationary basis.

For students who leave secondary school in order to take up employment, there is the opportunity for continued study through college extension classes, through the evening classes which are attached to many of the larger schools, and, in the case of teachers and of some technicians, through in-service, vacation and correspondence courses.

The Ethiopian academic year begins in September and ends in July. It is divided into three terms by short vacations at Christmas and at Easter. In this connexion it may be noted that the Ethiopian Christmas is celebrated on 7 January, and the Ethiopian Easter does not always coincide with the Western Church observance.

In addition to the Christmas, Easter and long vacations (covering approximately 14, 9 and 66 days respectively), schools are closed during term time for the one-day celebrations of national holidays on the anniversaries of the Emperor's Coronation, the Victory of Adowa, and the Liberation of the Country, and for the commemoration of Martyrs' Day. In Addis Ababa the closing of schools for the long vacation coincides with the celebration of the Emperor's birthday on 23 July, but for schools elsewhere the term finishes some two weeks earlier. The normal school week consists of 5 days (Monday to Friday); in some cases, schools are closed on a week-day afternoon and opened on Saturday morning. In most secondary schools, the day is divided into 7 teaching periods of 45 minutes each.

In the organization and administration of most secondary schools, including the prescription of teaching methods, the grouping or streaming of pupils and the testing of achievement, a considerable measure of discretion is entrusted to the headmaster.

There are, however, standard curricula laid down by the Ministry of Education for its schools, and in many instances students are prepared for external examinations. These examinations have served a valuable purpose in relating Ethiopian standards to those obtaining elsewhere, and in facilitating the admission of Ethiopian students to foreign colleges, but with the development of higher education in the country the school programmes and curricula are increasingly reflecting local culture and conditions.

A large proportion of the teaching staff in Ethiopian secondary schools and colleges is made up of foreign personnel employed under contract and recruited from many different lands. It has been found that the variety of cultural and academic backgrounds represented by these teachers has tended to the enrichment of the school programme and, taken together with the traditional elements in Ethiopian culture, has helped in the evolving of a system of education which is particularly adapted to the needs of Ethiopia.

It will be appreciated, however, that the cost of importing highly qualified teachers from abroad is very high in relation to the total budget, and priority is being given to the training of Ethiopian personnel to work at all levels in the government school system.

Foreign employees who are engaged from abroad are employed under contract for fixed terms of 3 years' duration; others, already resident in Ethiopia, are employed locally on an annual basis.

Ethiopian teachers enjoy a large measure of security of tenure. They are paid in accordance with the Ministry's salary scale, which recognizes experience as well as academic and professional qualifications.

Facilities are available for the professional and academic upgrading of teachers through extension programmes and through in-service, correspondence and vacation courses, and experienced teachers are recruited each year for admission to full-time 4-year degree courses at the University College of Addis Ababa.

General secondary schools

For the present, and pending the projected introduction of comprehensive secondary schools with academic, technical and professional streams, the place of the general secondary school is largely filled by the academic secondary schools.

The principal aim of the academic secondary schools is to prepare students for admission to the different college programmes, but they serve also to furnish recruits to various special training courses, and a proportion of the students completing the twelfth grade are absorbed directly into business and government employment each year.

In 1958/59 there were 24 government academic secondary schools established in Ethiopia. Nine of these schools were located in Addis Ababa, two in Asmara (Eritrea), and the remainder were distributed throughout the Empire. Most of the schools were co-educational, but three in Addis Ababa were reserved for boys and one for girls.

The academic secondary school at present has a 4-year programme. The subjects offered include Amharic, English, French, history, geography, mathematics (geometry, algebra, arithmetic), and general science, together with such non-academic subjects as moral instruction, music, domestic science and physical education.

At the completion of the twelfth grade, students are eligible to sit for the Ethiopian School Leaving Certificate and the London General Certificate of Education examinations. To be eligible to receive an Ethiopian School Leaving Certificate, students are required to pass in Amharic, English, mathematics and any other two subjects. Candidates who satisfy college entrance requirements may continue their education at the University College of Addis Ababa, the Haile Selassie I Public Health College and Training Centre, the College of Engineering, the Building College, the College of Agricultural and Mechanical Arts, or one of the Defence colleges.

The 24 secondary schools mentioned above do not include the Theological Academy and the Lycée Franco-Ethiopien Gabre Mariam in Addis Ababa, and certain private schools.

The Theological Academy is sponsored by the Ethiopian Church in conjunction with the Ministry of Education and Fine Arts. The programme follows very closely that prescribed for the academic secondary schools, but with a certain emphasis upon the special theological and cultural interests of the Church. Students are recruited mainly from the elementary sections of church schools, but the Academy is also open to candidates from government schools.

The Lycéee Franco-Ethiopien Gabre Mariam is jointly sponsored by the French and Ethiopian authorities. It has a large enrolment in the primary section and a substantial secondary section which prepares students for the *baccalauréat* examination. Instruction is in French, and Amharic and English are taught as subjects.

Among private institutions mention may be made of the English School, the German School, St. Joseph's School and the Nazareth School, which also enrol Ethiopian students in their secondary grades, and the Evangelical Secondary School at Debre Zeit.

Agricultural schools

At the secondary level there are two schools which are operated by the Ministry of Agriculture—the Jimma Agricultural Technical School in Kaffa Province, and the Agricultural School at Ambo in Shoa Province.

The programme covers a period of 4 years. First year (ninth grade) subjects include Amharic, English, general science, arithmetic, agriculture and hygiene. Biology and world history are added in the tenth grade and chemistry and algebra in the eleventh. Additional courses in the twelfth grade include Ethiopian history, economic geography, farming practice, physics and geometry.

In addition to the general course, which is designed to prepare students for college work in agriculture, there is a special 2-year course in forestry. Candidates successfully completing this course are awarded the forest ranger

diploma; those who are particularly highly qualified may be allowed to continue their studies for two more years and to receive the forestry engineer diploma at the end of the fourth year.

All students are boarders and receive free maintenance, including medical care. Vacation travel expenses are also paid, together with a *per diem* allowance for trips undertaken as part of the school programme. There are opportunities for paid employment for students at both schools.

Superior graduates from the agricultural schools are eligible for admission to the degree course at the Imperial Ethiopian College of Agriculture and Mechanical Arts; there are also occasional scholarships available for study abroad in specialized subjects.

The Commercial School

Commercial education is provided by the Ministry of Education through the Commercial School in Addis Ababa. The programme is designed to prepare clerks and secretaries for government and business employment. The courses have previously covered 4 years, but according to the revised programme which is being introduced in 1959/60, the regular course for candidates who have completed the eighth grade of elementary school will cover 3 years. The first year (grade 9) of this programme is devoted to academic and general subjects including Amharic, English, French, morals and current affairs. During the second and third years the students will specialize as clerks or as secretaries. The secretarial section provides training in English shorthand, Amharic typewriting, English typewriting, and general office practice. The clerical section offers courses in book-keeping and accounting, Amharic typewriting, English typewriting and general office practice.

In addition to the regular programme, the school now offers special concentrated 1-year and 2-year courses in commercial subjects. These courses are open to selected students from the tenth grade and above who will be admitted directly to the second year of technical training.

The school operates evening classes as well as day courses, and the Ministry of Education proposes to include commercial streams in its projected comprehensive secondary schools.

Health training courses

Technical and professional courses at the secondary level, which are sponsored by the Ministry of Public Health in collaboration with international and national organizations and technical assistance programmes, include malaria eradication, community nurses and sanitarians, and regular nurses' training.

The Malaria Eradication Training School. The programme is a 6-month course for male students only. Students receive monthly stipends of 50 Ethiopian dollars and are responsible for their own keep and clothing. Candidates must have completed at least the ninth grade in secondary school, have passed the special entrance examination and be between 18 and 25 years of age. They undertake to work in the Nazareth Malaria Pilot Project (Shoa Province) for a minimum period of 5 years and to accept placement in any part of the country.

The Haile Selassie I Public Health College and Training Centre. This institution, situated at Gondar (Begemdir Province) trains sanitarians (men) and community nurses (women).

The course for sanitarians comprises 1 year of school plus 1 year of supervised field work with a public health team. The subjects studied include sanitation, insect control and public health education, together with English, mathematics, physics, chemistry, anatomy and statistics.

For community nurses, the course of study includes 2 years at the school plus 1 year of supervised field work with a public health team. In addition to nursing, students study English, psychology, sociology, anatomy, physiology, microbiology, drugs, diseases, nutrition, hygiene, midwifery, infant and child care and related subjects.

For both courses, candidates must be between 17 and 25 years of age, and have passed the eighth grade general examination and a special medical examination. Students undertake to work for the Ministry of Public Health as members of health teams serving rural communities throughout the Empire.

Teaching hospitals. Regular nurses' training is provided in five teaching hospitals, three of which are located in Addis Ababa, one in Lekempti and one in Asmara. These courses cover up to 4 years, and the students in Lekempti and Addis Ababa are normally recruited from the higher grades of academic secondary school. All students are required to take courses in English, mathematics and chemistry, as well as professional subjects.

Technical and trade schools

Secondary level instruction in technical and vocational skills is provided by the Technical School in Addis Ababa, the Vocational Trade School in Asmara and the Vocational Building Trades School in Addis Ababa.

The Technical School is operated by the Ministry of Education, and the Vocational Trade Schools are co-operative projects with the United States Operations Mission to Ethiopia.

Other specialized programmes are taught at schools operated by the Department of Civil Aviation and the Imperial Board of Telecommunications in collaboration with the United Nations, and there are several service institutions.

The Government is aware of the importance of increasing the number of skilled technicians, and it is intended that additional facilities shall be provided and vocational streams added to existing secondary schools.

The Technical School. The objective of the Technical School in Addis Ababa is to produce well-trained technicians for industry who will be capable of advancing to supervisory positions. The school offers a course in teacher training and provides a general education designed to prepare all its graduates for participation in civic and community activities.

The programme extends for 4 years beyond the eighth grade. The first year (grade 9) is devoted to basic skills in woodwork, metalwork and electricity. During the remaining 3 years the students specialize in one particular trade shop. At present there are 11 trades—foundry, forging and welding, machines, sheet metal work, auto-mechanics, electricity, radio, arts and crafts, cabinet making, drafting (mechanical and architectural), surveying.

The working day is divided into two sessions—morning shop and afternoon academic studies, or vice versa. Academic subjects include Amharic, English, mathematics, science, morals, and mechanical drawing. Shop management and teacher training are introduced as additional subjects in the fourth year. As far as possible, academic subjects are related to the practical work in the different shops.

As stated above, students are prepared for employment by government departments or by business and industrial firms in Ethiopia. There is also the opportunity for outstanding graduates to continue their education at the College of Engineering or the Building College.

The Vocational Trade School. The programme covers 3 years. All students are required to study English, Amharic, mathematics, science, mechanical drawing, health and physical education.

During the first year all students take general work shop practice; during the second and third years each student must specialize in one of the following courses: auto shop, machine shop, electrical shop, woodwork and masonry shop, forging, welding and sheet metal shop.

Admission is restricted to Ethiopian nationals between the ages of 16 and 22 years and preference is given to candidates who have passed the eighth-grade general examination. It is the policy of the school to attempt to have each beginning class composed of an equal number of students from each of the eight divisions of Eritrea, and further preference is given to applicants from rural areas. All candidates are required to take aptitude tests given by the school.

The Building Trades School. The school trains semi-skilled workmen in the building trades and also prepares future teachers of building skills. The course lasts 1 year and students are assigned to one of the following divisions: electrical installation, carpentry, plumbing, or brick and stone masonry. In addition to practical instruction, related shop mathematics and mechanical drawing are taught for 1 hour each day. Instruction is in Amharic.

Applicants for admission to the school must be at least 16 years old. Any student who has completed the fourth grade of elementary school may be admitted if he passes the special entrance examination. Candidates who have passed the eighth grade general examination are exempted from the special test.

The Civil Aviation School. The school offers 3-year courses in radio, electronics, meteorology and aircraft maintenance. Students are selected from the higher grades of academic secondary school and are paid special allowances for the period of their training. Upon completion, they are eligible for regular government employment.

The Imperial Board of Telecommunications training courses. The Board provides various specialized training opportunities for graduates from the eighth grade of elementary school and from the higher grades of secondary education. Students taking these courses are paid salaries for the period of their training and are admitted directly into the Boards' employment.

Service institutions. The service institutions recruiting students for instruction at the secondary level include the Aba Dina Imperial Police Staff College (Addis Ababa), the Imperial Naval Petty Officer School at Massawa (Eritrea), the Imperial Ethiopian Air Force Ground School (Debra Zeit), and the Debra Zeit Technical High School.

The Debra Zeit Technical High School, which was established in 1958, provides technical training in engineering science, technical drawing, woodwork and metalwork; mathematics, English, Amharic, geography and history are also taught, together with physical education and religious instruction.

Candidates for admission must be boys between 12 and 15 years of age, of excellent physique, who have achieved an above-average score in the eighth grade general examination.

Students who have successfully completed the 5-year course of study may sit for the Cambridge Oversea School Certificate examination. Graduates of the Debra Zeit Technical High School are qualified for technical posts in government agencies and the armed forces; they are also eligible for admission into the Imperial Ethiopian Air Force Flying School.

Teacher training schools

In addition to the college-level degree courses provided at the University College of Addis Ababa, and to the advanced studies undertaken abroad by graduates of the University College, there are several teacher education programmes conducted as part of the secondary school system in Ethiopia. These courses are intended to prepare recruits for the teaching service in elementary schools (grades 1 to 4, and grades 5 to 8), and also for certain specialized branches such as community education and arts and crafts.

The Harar Teacher Training School prepares students in academic and professional subjects, so that they may become teachers of grades 1 to 8, and also take the examination for the Ethiopian School Leaving Certificate.

The programme covers a period of 4 years, and the course includes the regular academic secondary school subjects—Amharic, English, mathematics, science and social studies—together with psychology, teaching methods, principles of education, student teaching, visual aids and co-curricular activities. Practice teaching is done in neighbouring government schools and at the model school attached to the training school.

The school is open to both boys and girls. Preference is given to more mature students and to persons who have had one or more years of practical teaching experience. In 1959/60 applicants were required to have completed the ninth grade of secondary school, but in future places will again be provided for recruits from the eighth grade. All applicants are required to present health certificates.

Graduates of the Harar Teaching Training School are assigned to schools throughout the Empire. After 2 years' teaching experience, they are eligible to take the special examination for admission to a 4-year degree course at the University College of Addis Ababa.

The Haile Selassie I Day School in Addis Ababa offers two secondary-level teacher training programmes in addition to in-service courses for directors and inspectors.

The 1-year teacher training programme concentrates on training students in methods of teaching elementary school subjects. Courses include Amharic, English, mathematics, science, social studies, psychology, education, shop work, physical education, music, art, health, practice teaching, and co-curricular activities.

The 4-year programme enables students to take the examinations for the Ethiopian School Leaving Certificate and the London University General Certificate of Education and also to enter the teaching profession. The course of study includes the regular academic secondary school subjects (Amharic, English, mathematics, science, social studies) plus psychology, teaching methods, history of education, statistics, practice teaching and co-curricular activities.

All applicants must have passed the eighth grade general examination and hold the Ministry of Education health certificate. Both girls and boys are accepted; some preference is given to girls, and in the 1-year programme to older and more mature students, some of whom are drawn from the higher grades of secondary schools.

Under special circumstances, students completing the 1-year programme may continue to study in secondary school. Outstanding graduates from the 4-year programme are eligible for admission to the University College of Addis Ababa or to other college-level institutions in Ethiopia.

The Empress Menen Girls' School in Addis Ababa has a special teacher training programme for girls, similar to the 4-year course at the Haile Selassi I Day School, in addition to a regular 4-year academic programme. There is also a domestic science course available for interested students.

At the end of the 4 years, students are eligible to sit for the Ethiopian School Leaving Certificate examination and the London University General Certificate of Education, and those who have taken the special course are awarded a Teachers' Training Certificate as having completed the equivalent of 1 year's full-time teacher training.

The Majite Community Development Workers' Training Centre was established by the Ministry of Education in collaboration with Unesco. The programme is designed to cover 1 year, and the required subjects include literacy methods, teaching methods, arts and crafts, audio-visual aids, agriculture, health and recreation. Optional courses are offered in gardening, chicken breeding and sports.

Candidates for admission must be between 19 and 30 years of age, and have passed the eighth grade general examination; admission is also made from the higher grades in other secondary programmes.

Graduates from the Majite Community Development Workers' Training Centre are eligible for employment by the Government to conduct literacy campaigns and community development programmes throughout the Empire.

The Debra Berhan Community Education Teacher Training School was established by the Ministry of Education in collaboration with the United States Operations Mission to Ethiopia. The programme has recently been extended to cover a second year and includes the following subjects and activities: mathematics, science, health and sanitation, social studies, agriculture, school administration, blacksmithing, carpentry, morals, literacy methods, methods of teaching, brickmaking, pottery, arts and crafts, sports and recreations, supervised field experience (teaching in village schools).

Applicants must be males between the ages of 20 and 30 who are of robust physique. Experienced teachers who have completed the sixth or seventh grade of primary education may be accepted at the school, but all student applicants must have completed the eighth grade.

Graduates of the Debra Berhan Community Education Teacher Training School are employed by the Government to work in rural primary schools.

The Handicraft Teacher Training School. The school is housed in the Technical School compound, Addis Ababa. The course covers 4 years. The first year is devoted to developing basic skills in woodwork, metalwork and the use of electric tools, together with general education courses in Amharic, English, mathematics, science, morals, mechanical drawing, shop management, teaching methods. During the last 3 years students attend arts and crafts classes, and the required courses include weaving, fibrework and rug weaving, basketry, leathercrafts, ceramics, carving, drawing, painting, sculpture, puppetry and dramatics, classroom art and art history, together with educational psychology, methods of teaching arts and crafts, and practical teaching.

Candidates for admission must undertake to teach in government schools for a period of at least 3 years following completion of their studies.

The Eritrean Teacher Training School is located in the city of Asmara and offers a 2-year programme. All students are required to study English, Amharic, psychology, mathematics, social studies, physical education, hygiene, principles of teaching, audio-visual aids and practice teaching.

All candidates must have completed the eighth grade, but preference is given to students with higher academic levels of achievement. The course of study is open to both men and women between the ages of 17 and 22. Applicants must pass an aptitude entrance examination and a special physical examination. All candidates admitted to the school undertake to serve the Eritrean Government as teachers for at least 2 years following graduation.

Other specialized schools

The Art School offers a 4-year course. Compulsory subjects include history of art, psychology of art, figure drawing, life painting, anatomy, modelling, composition, etching and lithography, and students may specialize in painting,

sculpture or commercial art. Candidates must have passed the eighth grade general examination and be not more than 25 years of age. Before any student is admitted, he is required to submit a specimen of his work. Graduates are eligible for employment by the Ministry of Education as teachers of art, or for employment as artists or illustrators.

The Music School, which is also maintained by the Ministry of Education, provides part-time instruction for students selected from elementary and secondary schools in Addis Ababa, and from college and other programmes.

Out-of-class activities

Secondary schools are encouraged to take an active part in community life, to present dramatic and other entertainments, to organize sports days, and to participate in competitive games with local teams. School magazines are published. Scout and Guide troops are maintained by many schools, and the interest of parents is solicited for school projects.

Clubs and societies reflecting student interests—drama, debating, music, gardening, handicrafts, photography, etc. —are to be found in most of the schools, and the students gain much practical experience from their organization and management.

TRENDS AND PROBLEMS

Reference has been made in the preceding sections to some of the recent trends in secondary education, and to proposed changes in its organization. The more important of these may now be summarized as including: the projected introduction of comprehensive secondary schooling, with technical, vocational and academic streams; the revision of curricula, the production of locally designed materials in both Amharic and English, and an increase in the length of secondary schooling; the gradual abolition of free boarding facilities for boys in certain types of schooling and the conversion of boarding to day schools; increasing emphasis upon student counselling and guidance, the training of technicians and teacher education; and the decentralization of schools with the consequent assumption of increased responsibility by local communities.

It may be helpful to recall that 35 years ago the Emperor, as Regent, laid down two principles which have served as guiding lines in the development of modern education in this country: first, that the nation as a whole must co-operate in the development of schools, and second, that the introduction of new ideas from other countries must never be allowed to obscure the traditional Ethiopian culture.

In the light of these principles, the trends listed above will be seen to have a special significance.

According to the proposed new programme, instruction in the 6-year elementary schools will be given mainly in Amharic, with English taught as a subject, and it is thought that by using the national language as the medium of instruction students will be able to attain the same overall standard as at present, in spite of the reduced length of time for this level of schooling.

The projected 5-year secondary programme will be taught in two parts. In the first 2 years, stress will be laid upon general education, including the concentrated study of English, and upon a programme of counselling and guidance. For the second 3 years, students will undertake specialized academic, professional, technical and vocational courses. As in the case of the elementary grades, it is believed that the current standards of achievement at the secondary level will be at least maintained, and it is hoped that they may be improved upon.

The new programme calls for revised curricula, and these are now being tried out on an experimental basis in selected schools. It calls also for the greatly increased production of teaching materials in Amharic and in English, and for an enlarged programme of teacher education to ensure the preparation in sufficient numbers of Ethiopian teachers who will be skilled and competent in applying the new curricula. Accordingly, steps are being taken to meet these needs.

Again, in order to prepare personnel who are qualified to contribute towards the growing industrialization of Ethiopia, particular stress is being placed upon training in commercial, technical and vocational subjects. New programmes have been set up, and it has been decided that a ratio in favour of the non-academic types of education should be aimed at in selecting candidates to enter secondary schooling.

Another important factor in the emerging pattern of secondary education is the decentralization of schooling and the gradual abolition of free boarding facilities. The establishment of new academic secondary day schools in provincial centres throughout the Empire and the planned location of vocational and special schools has greatly stimulated popular interest in and support for the different types of post-elementary and higher education.

For certain kinds of schooling, boarding facilities for boys have now been entirely withdrawn, but it has been found that a significant proportion of parents are prepared to pay the fees required for their sons to attend one of the older-established academic secondary schools as boarding students.

The Government is concerned to encourage the enrolment of girls at all levels of the system: to this end, special boarding privileges continue to be offered to them in secondary schools and it is not foreseen that any early change will be possible in these arrangements.

As a means of transition from the system whereby free boarding and maintenance were granted to all official secondary school students, the Government is now paying stipends to needy boys and to those who are obliged to leave their homes in order to attend a centrally-located school. There are obvious difficulties inherent in this arrangement, but the withdrawal of boarding facilities makes it possible to extend the opportunity for schooling to a much greater number of worthy candidates than before and the stipend system has therefore been adopted as an interim measure.

In many areas of activity connected with secondary education substantial progress has been made and invaluable help has been received in every aspect of educational development from national and international organizations and programmes of technical assistance.

But although much has been accomplished, much remains to be done. Today, the factors which are impeding the Government in the full implementation of its educational policies may be summarized under two heads—finance and personnel.

Upon the liberation of Ethiopia in 1941, the Government was confronted with the need to restore the elementary schools and to recreate as rapidly as possible a system of higher education that would help to replace the grievous losses suffered during five years of resistance to foreign domination. Much use has been made of opportunities for Ethiopian students to study abroad, but emphasis has naturally been placed upon the erection, equipment and staffing of schools and colleges in the country itself. The success that has attended this effort is indicated by the outstanding results achieved by Ethiopian candidates both here and overseas, and by the fact the Government has been able to offer hospitality and college education to students from other African countries.

The priority given to higher levels of education has, however, absorbed a very considerable proportion of the funds available for the overall programme. There is a great and ever-growing demand for formal schooling in Ethiopia, and among the problems confronting the administration, one of the most urgent is the need to increase the facilities for elementary education while maintaining the present secondary and college programmes and developing them as new needs arise.

In regard to personnel, the preparation of Ethiopian teachers to replace a proportion of the present foreign staff and to serve in the new schools and projects has important implications both for the budget and for the programme. Naturally, the accomplishment of this aim forms a major objective in the development of secondary and higher education, and a good start has been made, through training schools, in-service programmes and degree courses here and abroad, to prepare sufficient teachers to undertake responsibility for Ethiopia's expanding schools and colleges.

Ethiopia continues, however, to attach the greatest importance to her cultural ties and relations with other countries, and the administration is fully aware of the importance of maintaining internationally recognized standards of achievement throughout the whole range of its educational system.

STATISTICS

Population (mid-year 1958 estimate): 21,600,000.
Area: 457,267 square miles; 1,184,320 square kilometres.
Population density: 47 per square mile; 18 per square kilometre.

Summary of school statistics, 1953–57. Excluding adult education courses enrolling 246 women, enrolment at educational institutions of all levels was about 182,000 in 1957/58, representing less than 1 per cent of the total estimated population. Enrolment data are, however, incomplete for schools administered by the Ethiopian Church, private and mission institutions. Of the total reported enrolment, 96 per cent were pupils in kindergartens, primary schools and special educational institutions; over 2 per cent in general secondary schools; 1 per cent in vocational education, 0.4 per cent in secondary and higher teacher training; and the remainder, about 0.3 per cent, at university and other higher educational institutions. In 1957/58 some 5,000 teachers were reported in primary schools (excluding a few private schools in Eritrea), of whom 15 per cent were women. The average pupil-teacher ratio in primary schools was about 34 compared with 36 in 1953/54. Data on teaching staff at other levels of education are incomplete. In 1957/58 girls made up about 20 per cent of the enrolment in primary schools, 13 per cent in general secondary schools, 26 per cent in vocational education, and about 5 per cent at the higher education level. Compared with 1953/54, enrolment had more than doubled in primary schools and in general secondary schools and in secondary teacher training courses had increased by 90 per cent. The number of students at higher educational institutions rose from 142 in 1953/54 to 531 in 1957/58. (See Table 1.)

Examination results in secondary education, 1953–57. The number of general secondary school leaving certificates

granted in Ethiopia in 1957/58 was 468, representing an increase of 170 per cent over those awarded in 1953/54. Teacher training certificates increased from 159 to 290 over the corresponding period. No data are available on the proportion of women candidates receiving these certificates.

Educational finance, 1958/59. Estimated budgetary expenditure on education in 1958/59, fiscal year beginning September, was 27,087,538 Ethiopian dollars, representing about 1.3 Ethiopian dollars per inhabitant. Some 13 per cent of the total spent was for capital expenditure. (See Table 2.)

1. Official exchange rate: 1 Ethiopian dollar = 0.40 U.S. dollar.
2. Budget estimate.
3. Includes some expenditure for higher education.
4. For provincial elementary schools.
5. Includes salaries for elementary school teachers in Addis Ababa and recurring expenditure for the Engineering College (higher education).
6. Includes only the expenditure for the University College (1,527,610 dollars) and the Building College (701,990 dollars). In addition, the Agricultural College has a budget of approximately 609,745 dollars and the Public Health College approximately 1,067,910 dollars. The total budget for the Engineering College amounted to approximately 1,100,000 dollars of which the recurring expenditure is included with expenditure for secondary education (see footnote[5]).

FINLAND

THE EDUCATIONAL SYSTEM

The Finnish school system comprises three main types of school—primary, secondary and vocational. The function of the primary school, at which attendance is compulsory, is to give every child a basic education. It also serves to prepare for secondary education and training in various kinds of vocational school.

Secondary education is usually divided into two stages: the junior secondary school, designed to give young people general training in citizenship to supplement the primary school course, and the senior secondary school, which mainly prepares pupils for study at the university level. The various types of vocational school, again, impart the knowledge and skills needed to acquire professional competence. Outside the scope of the school system proper lie the folk high schools and workers' institutes, as well as the institutions of higher learning.

Administratively, the primary and secondary schools come under the jurisdiction of the Ministry of Education and, under it, the Central Board of Schools. The vocational schools are under the jurisdiction of different Ministries, according to their purpose. Thus, for example, the technical, commercial and maritime institutes as well as the trade schools proper in the fields of industry, handicrafts and economics are supervised by the Vocational Training Department of the Ministry of Trade and Industry. The schools of agriculture, household economy and domestic arts and crafts are under the supervision of the Board of Agriculture of the Ministry of Agriculture. Certain trade schools for the handicapped and special schools for the training of personnel in the social services are under the jurisdiction of the Ministry of Social Affairs.

The most important laws and decrees governing the school system are the following: Primary Education Act, 1 July 1957; Primary School Decree, 23 July 1958; Education Act, 26 August 1872; Act concerning State Aid to Private Secondary Schools, 6 October 1950; Private Secondary School Decree, 19 January 1951; Vocational Education Act, 25 April 1958; Vocational Education Decree, 16 January 1959; Technical Education Act, 26 May 1939; Commercial Education Act, 26 May 1939; Agricultural Education Act, 1 July 1927; Act Governing Schools of Household Economy, 18 May 1929; Act Governing Schools of Domestic Arts and Crafts, 23 May 1929; Act Governing Primary School Teacher Training Colleges, 9 January 1958; Decree concerning Primary School Teacher Training Colleges, 23 July 1958; Decree concerning State Aid to Workers' Institutes, 28 April 1938; Act concerning State Aid to Folk High Schools, 7 July 1950; Decree concerning the Central Board of Schools, 1 February 1957.

According to the Primary Education Act, school attendance is compulsory for all children from 7 to 16 years of age. The duty is ordinarily fulfilled in primary school, although a substantial part (about one-third) of the pupils move on, before they are past the age of compulsory attendance, from primary school to secondary school or some other type of educational institution.

The primary schools are established and run by local authorities (communes) but the latter receive financial aid from the State. The amount of the subsidy varies according to the type of commune and, in some degree, to its economic situation also. Municipalities receive state aid amounting to about 15–20 per cent of the total expenditure for education and the rural communes about 70 per cent.

The state secondary schools are under the direct jurisdiction of the Central Board of Schools, which must however submit certain important matters, primarily of an economic or administrative nature, to the Ministry of Education or the Council of State for decision. The private secondary schools are institutions founded and maintained by private citizens, communes or foundations, and their operations are managed by boards of directors set up by the persons or organizations maintaining them. These schools are under the supervision of the Central Board of Schools if they receive assistance from the State. Such assistance covers nearly 70 per cent of maintenance costs.

The vocational schools—preparing for industrial pursuits, trades, etc.—are defined by the Act which came into force at the beginning of 1959 as: (a) ordinary vocational schools; (b) apprenticeship schools; (c) vocational institutes; and (d) normal trade schools. The ordinary vocational schools are either general vocational schools, which the local authorities are bound by law to establish and maintain, or specialized trade schools, which are generally privately maintained. There are still at present some preparatory vocational schools but under the new Act these will be converted by 1970 into general vocational schools, which are based on the curriculum of the branch of the primary school known as the 'citizens' school'.

The function of ordinary vocational schools is to give pupils the knowledge required to master a trade and a sufficiently varied programme of instruction in the schools' own workshops to lay the basis for acquiring professional skill after a prescribed period of practical experience. Schools of this kind are the central vocational schools of the State, but the new law requires that the communes, too, establish general vocational schools. The purpose of the apprenticeship school is to give apprentices already at work training designed to enable them to master their trades. The vocational institutes give advanced specialized training in various trades as well as courses in foremanship and work organization. The task of the normal trade schools is to instruct pupils intending to become teachers in vocational schools in practical teaching skills.

The technical schools are divided into institutions training technicians and institutions at the college level, offering engineering courses. The commercial institutes train office and sales personnel and also give advanced

courses in economics and business administration. In addition, there are many kinds of agricultural, domestic arts and crafts, household economy, handicrafts and similar vocational schools.

The structure of the school system is shown in the diagram on page 465.

THE DEVELOPMENT OF SECONDARY EDUCATION

The history of secondary education in Finland goes back many centuries: the first regulations governing education were included in the Canonical Law promulgated in 1571. The most important legislative measures affecting the development of the school system have been the educational laws of 1649, 1724, 1843 and 1872. The last-mentioned still forms the basis of the legislation governing secondary education proper; it has, however, been supplemented and amended in numerous respects to meet the new conditions created by the evolution of the school system.

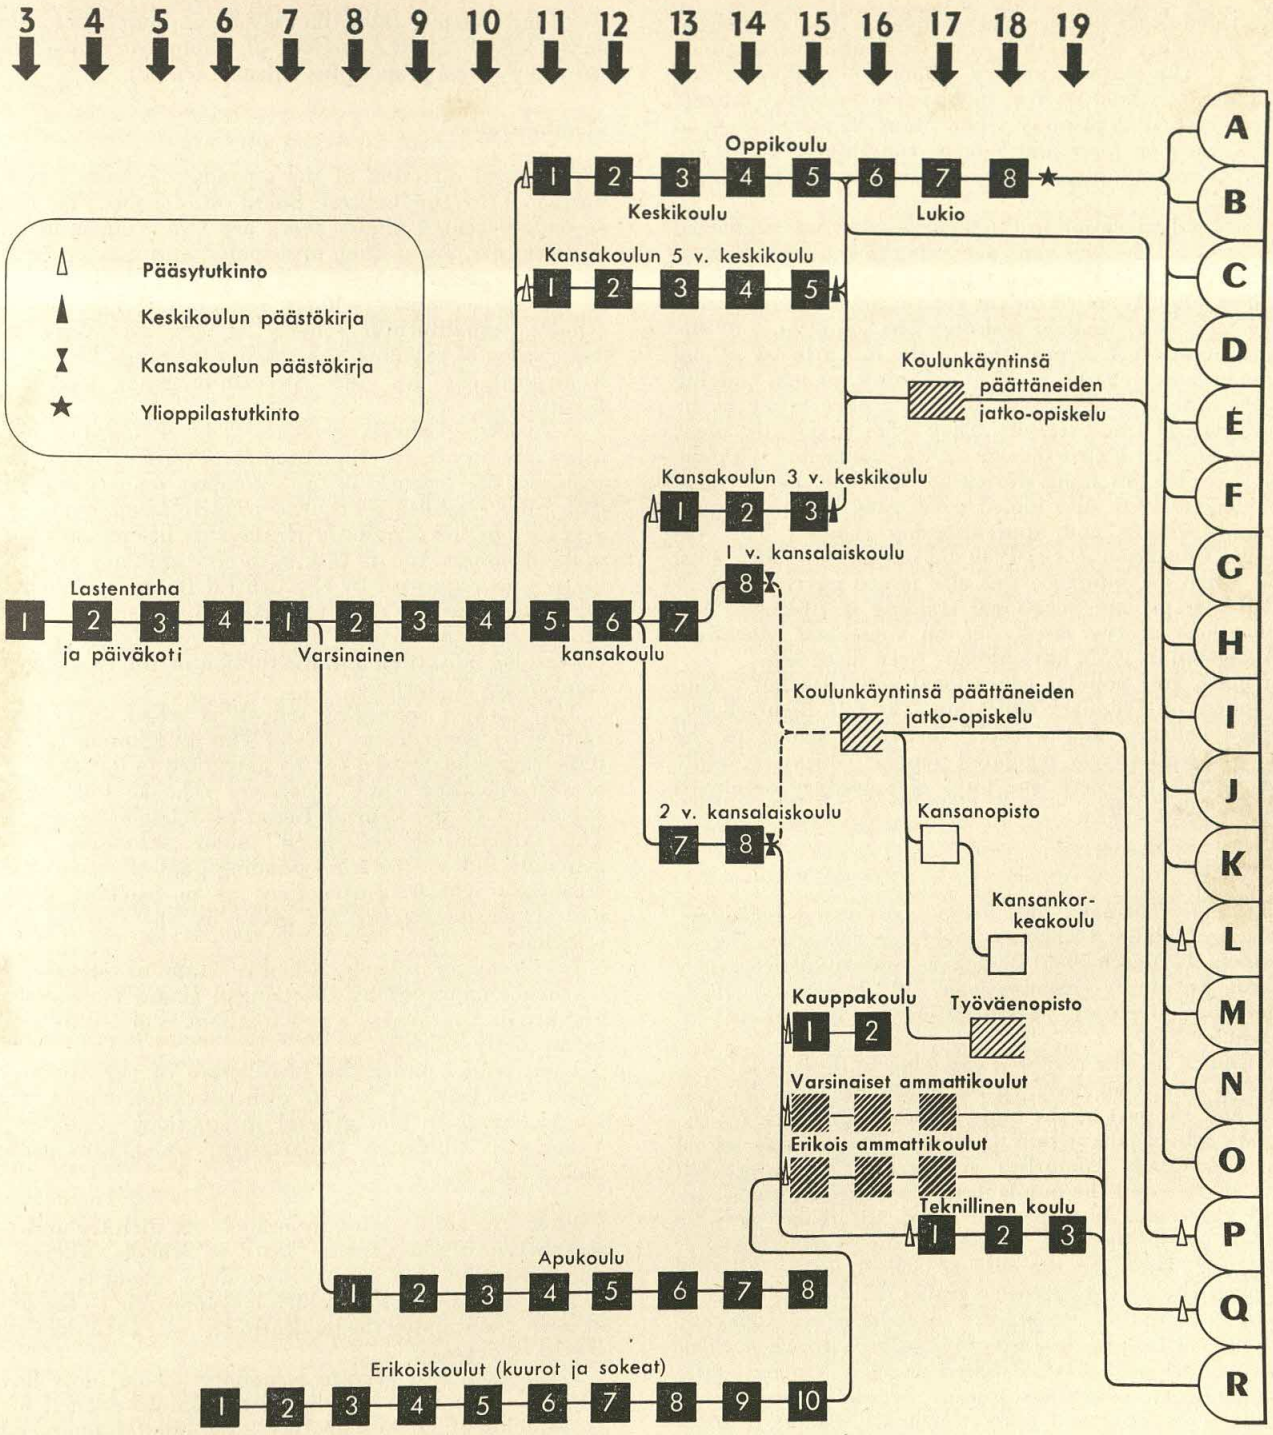
Finland's political union for centuries with the Kingdom of Sweden brought it about that Swedish became the language of official affairs and of the ruling class. The situation did not change in this respect even after Finland in 1809 was established as an autonomous Grand Duchy under the Tsar of Russia. As late as the middle of last century, all secondary schools, both state and private, used Swedish as the language of instruction. It was not until 1858 that the first Finnish-language state secondary school was founded. In order to gain the benefits of secondary education, the linguistic majority was forced to establish private secondary schools. Since the 1870's a large number have been founded, most of them being co-educational. The private secondary schools, both Finnish and Swedish, whether maintained by a patrons' association or school corporation organized for this express purpose, by some private citizen or by a commune, are usually organized along the same lines as the government schools. The position of the private secondary schools has been largely stabilized by the Private Secondary School Act and Decree, which contains provisions relating to the establishment, administration, teaching staffs, diploma-granting rights, state subsidies, etc., of these schools. Numerous private secondary schools have in the course of time been converted into state secondary schools.

Since the majority of the state secondary schools are situated in cities, towns and boroughs, private secondary schools have been founded particularly in rural communities. There are 278 private secondary schools, over twice the number of state schools; but as the latter are above average in size, the enrolment in the private secondary schools is only some 20 per cent greater than that of the state schools. It is noteworthy that many of the private secondary schools (137) have only junior grades, whereas nearly all the state secondary schools, of which there are a total of 120, lead up to the university. Twelve per cent of all the secondary schools are Swedish (17 belonging to the State and 33 being private).

GLOSSARY

apukoulu: special school for backward children.
erikoisammattikoulut: specialized vocational training schools.
erikoiskoulut (kuurot ja sokeat): special schools (for the deaf and blind).
kansakoulu: see *varsinainen k.*
kansakoulun 3 v. keskikoulu: 3-year lower secondary school attached to a primary school.
kansakoulun 5 v. keskikoulu: 5-year lower secondary school attached to a primary school.
kansalaiskoulu: primary continuation school, called 'citizens' school, with 1-year (*1 v.*) or 2-year (*2 v.*) course.
kansankorkeakoulu: free adult education institute providing advanced courses.
kansanopisto: free adult education institute.
kauppakoulu: commercial school.
koulunkäyntinsä päättäneiden jatkoopiskelu: out-of-school study courses.
lastentarha ja päiväkoti: pre-primary institutions (kindergarten and day-nursery).
lukio: upper general secondary school.
oppikoulu: general secondary school.
teknillinen koulu: technical school.
työväenopisto: workers' institute.
varsinaiset ammattikoulut: regular vocational training schools.
varsinainen kansakoulu: regular primary school.

DEGREE-GRANTING INSTITUTIONS OF HIGHER EDUCATION



A. *Jumaluusopillinen tiedekunta:* faculty of theology.
B. *Lainopillinen tiedekunta:* faculty of law.
C. *Lääketieteellinen tiedekunta:* faculty of medicine.
D. *Farmaseuttinen laitos:* institute of pharmacy.
E. *Historiallis-kielitieteellinen tiedekunta:* faculty of history and philology.
F. *Valtiotieteellinen tiedekunta:* faculty of political science.
G. *Matemaattis-luonnontieteellinen tiedekunta:* mathematics and natural science section of the faculty of philosophy.
H. *Maatalous-metsätieteellinen tiedekunta:* faculty of agriculture and forestry.
I. *Voimistelulaitos:* institute of gymnastics.
J. *Teknillinen korkeakoulu:* engineering and architecture (college of technology).
K. *Eläinlääketieteellinen korkeakoulu:* veterinary science.
L. *Opettajakorkeakoulu:* education.
M. *Kauppakorkeakoulu:* commerce.
N. *Yhteiskunnallinen korkeakoulu:* social sciences.
O. *Sibelius-Akatemia:* Sibelius academy of music.

NON-DEGREE-GRANTING INSTITUTIONS OF HIGHER EDUCATION

P. *4 v. seminaari:* teacher training college with 4-year course.
Q. *5 v. seminaari:* teacher training college with 5-year course.
R. *ylemmat ammattikoulut:* advanced vocational and professional schools.

The third form of secondary school is the communal junior secondary school, though its curriculum corresponds to that of the state secondary schools. According to the new Primary School Decree, such junior secondary schools as are attached to primary schools may be established, in general, only in poor and remote communes. There are now 38 communal junior secondary schools, of which 2 are Swedish.

Vocational education in the modern sense was organized in Finland for the first time according to the provisions of an edict passed in 1885 and supplemented by a manifesto issued in 1900. It called for the establishment of lower and upper schools of manual training. The significance of the former diminished as provision of the full primary school course became general. In 1920 the lower manual training schools were abolished and the upper ones began to be called general trade schools. They were frequently night schools and the instruction given was connected with the work done by the pupils during the daytime. In the same year decrees were also issued concerning vocational preparatory schools and apprenticeship schools. The Vocational Education Act of 1939 did not go into effect until 1942, when an ordinance was also issued governing communal and private vocational training institutions. The implications of the latest Act on vocational education, promulgated in 1959, have already been discussed.

In part, free popular educational activities fall within the sphere of secondary education. The folk high schools, people's colleges, and workers' institutes belong to the sphere of legislatively regulated popular education, while study circles represent one form of voluntary organized educational activity.

Legal basis

Other important laws and decrees governing secondary education include: Ordinance governing Secondary School Curricula, 12 March 1948; Ordinance concerning Secondary School Entrance Examinations, 17 December 1954; Ordinance governing Matriculation Examinations, 26 September 1947.

Inasmuch as this review is intended to deal with every phase of education designed for pupils between the ages of 12 and 18, part of the basic schooling provided by the primary school falls within its sphere. The primary school proper generally comprises six grades—in exceptional cases, seven—and the pupils in the two highest grades are 12–13 years old. In respect of them, the reader may be referred to the previous volume of the *World Survey of Education*[1]. However, the citizens' school, created in 1958 to replace the former extension grades (i.e. beyond grade 6) but still covered by compulsory attendance requirements, lies totally within the bounds of secondary education. Since the secondary school is not based on the complete course of compulsory education (pupils generally proceed to secondary school after 4 years of primary school), primary grades 5 and 6 plus the citizens' school and the lower stages of secondary school are parallel educational institutions. The same applies also to the communal junior secondary school, which likewise admits pupils before they have completed the period of compulsory attendance (primary school proper plus citizens' school).

Administration

The general direction of the secondary schools has been entrusted to the Central Board of Schools. To handle secondary school affairs there are two Finnish-language departments, one dealing principally with matters relating to state secondary schools, and the other with those relating to private secondary schools, foreign-language secondary schools, experimental schools at the secondary level, supervision of teaching and teacher training. There is also a department for the Swedish-language educational institutions.

A Teachers' Council serves the Central Board of Schools as an advisory body. Appointed for a term of four years to represent the teachers in the secondary schools and public education establishments, the council meets every other year for a period of at most five days. It has no authority to make decisions, for its task is to give opinions on various matters as requested by the Central Board of Schools. In addition, it has the right to make proposals to the Council of State or the Central Board of Schools on questions concerning education and instruction or the economic and legal status of teachers.

The work of secondary schools is based on syllabuses ratified by government decree. The programmes of study in private schools need not be patterned in detail on those of corresponding state secondary schools, but must be submitted to the Central Board of Schools for approval. The syllabus of communal junior secondary schools generally follows the corresponding plan of study of state secondary schools. Instructions as to teaching methods and scholastic records are given by the Central Board of Schools.

In secondary schools, whether state or private, only textbooks approved by the Central Board of Schools are permitted. Approval of a new textbook is generally applied for by the publisher.

Each school under the jurisdiction of the Ministry of Trade and Industry has its own educational plan, drawn up according to the general instructions given by the Vocational Education Department, which also confirms each plan.

Control. The state secondary schools are directly under the jurisdiction of the Central Board of Schools, whereas the administration of a private secondary school is entrusted to its board of directors, which is responsible to the person or body maintaining the institution as well as to the Central Board of Schools.

Each state and private secondary school must have a parents' council, to which the communal council of the commune in which the school is located appoints five members for a term of three years at a time. The task of the parents' council is to maintain contact between the school and the home. It must carefully follow the activities of the school and, if any cause for complaint arises, call the attention of the principal to the matter. In case of need, the parents' council is entitled, as is the Central Board of Schools, to

1. *World Survey of Education: II–Primary Education*, Paris, Unesco, 1958, 1387pp.

take action to correct the situation. The parents' council is also under the obligation to respond to requests for reports to the Central Board of Schools on matters concerning the school.

The communal junior secondary schools are directly under the jurisdiction of the primary school board in rural communes and boroughs. In municipalities the junior secondary school is superintended by the primary school directorate. In addition, the primary school supervisor is entrusted with certain duties connected with the administration of communal junior secondary schools.

The internal administration of a state secondary school is mainly the task of the principal, who draws up the forms setting out the detailed plan of organization of the class work and sends them on to the Central Board of Schools. Each month he has to send to the Central Board of Schools a statement on funds spent, and at the end of the school year an annual report.

Principals of state secondary schools are appointed for periods of five years; the appointments are made by the Central Board of Schools from among the school's regular teaching staff after receiving reports on the matter from the staff and from the parents' council.

Although the board of directors of a private secondary school is entrusted with a large number of the duties that in the case of the state institutions are concentrated in the hands of the Central Board of Schools, it is obliged to present the Central Board of Schools with required information on the administration, curriculum, teachers, pupils and operative conditions of the school. The most important data are contained in the autumn communication, which is drawn up according to an accepted formula, and the annual report. Each private secondary school must also have a set of regulations approved by the Central Board of Schools.

The communal secondary school is governed by the same statutes as private secondary schools, but the communal junior secondary schools attached to primary schools are administratively under the superintendence of the primary school authorities.

The vocational schools are administratively under various Ministries—the Ministry of Communications and Public Works, the Ministry of Agriculture, the Ministry of Trade and Industry and the Ministry of Social Affairs.

The principal of a vocational school is appointed from among the teaching staff to serve as executive and administrative officer, or is directly engaged to take on teaching and executive duties. Each vocational school has its board of directors, which is responsible for the operation of the institution, as well as a duly ratified syllabus and set of regulations. If the commune or the private owner has more than one vocational school in the same locality, a joint principal may be appointed to take charge. Central vocational schools belonging to the State have a vocational school council for the purpose of localizing the operations of the institution in the province where it is situated and of guiding its development in general; each commune located in the central vocational school district appoints a representative for membership of the council.

Supervision and inspection. The inspection of both state and private secondary schools is carried out under the direction of the Central Board of Schools. There is an office of supervision under the board for this purpose, headed by an educational adviser. For general supervision and supervision of the individual subjects in the curriculum there are four chief inspectors who represent the following areas of instruction: Finnish language and literature; foreign languages; mathematics, physics and chemistry; natural science and geography. The other inspectors belonging to the office of supervision operate only within their particular subject field, supervising girls' and boys' gymnastics, household economy, girls' handicrafts and music; the inspector responsible for school meal programmes, the teaching of nutrition and social welfare activities in school, likewise confines himself to supervision and guidance within his own special domain.

Inspectors and chief inspectors are required to have passed a final examination at university level in the subject they are called upon to supervise, to possess a good practical and theoretical knowledge of the field of instruction, competence in teaching and a familiarity with educational questions.

In addition to the regular inspectors on the staff of the Central Board of Schools, experienced educators, mainly school principals, are invited each year to serve in a supervisory capacity for shorter terms.

In connexion with an inspection, a teachers' meeting is held to consider some general educational problem, as well as a conference for the teachers of the subject represented by the inspector concerned. In addition to the regular inspection, attention is focused on teacher guidance, pursuant to which the inspector may himself give lessons. There is also a final meeting at which the parents' council, principal and teaching staff (in private secondary schools, the board of directors, too) must be present. The inspection reports are dealt with at a session of the Central Board of Schools, which decides on whatever measures need to be taken.

It is aimed to carry out a general inspection of all the secondary schools at intervals of not more than five years. The grants awarded private secondary schools (see below) depend on the extent to which these schools fulfil the requirements for such state subsidies. As there are considerably more private than state secondary schools in the country and as many of them are of recent foundation or do not fulfil the conditions for continuous support from the Government, inspections are carried out in them far more frequently than, in particular, in the old state secondary schools.

As mentioned above, the parents' council is obliged to keep an eye on school operations. Members of the council are therefore entitled to free access to the school premises and are at liberty to inspect the school archives, correspondence and book-keeping. The parents' council thus lends the Central Board of Schools assistance in supervising the school.

The communal junior secondary school is mainly under the supervision of the primary school inspector. The rural communes and small towns are divided into 40 supervisory districts, in each of which there is one primary school inspector. However, members of the Central Board of Schools, councillors of education, chief inspectors and supervisors are also authorized to conduct inspections in them. If the

question of granting a communal junior secondary school the right to award junior secondary school certificates or diplomas arises, a general inspection must be carried out by the Central Board of Schools.

The inspection of vocational schools is the responsibility of the supervisors and other officials on the staffs of the government bureaux in charge of them.

In the field of popular educational activities, the supervisory duties are assumed by the counsellors of education concerned.

Finance. The proposals regarding appropriations to be set aside in the state budget for state secondary schools are made by the Central Board of Schools, which serves also as accounting office for state schools and superintends the use of funds awarded them. Moreover, it has been prescribed that the parents' council should from time to time inspect the balance sheets. During the scholastic year 1956/57 the net cost per pupil in state secondary schools was 40,000 Finnish marks.

Private secondary schools receive state aid provided they fulfil the prescribed conditions. Such financial assistance from the Government is either continuous or restricted to stipulated periods. The state grants are nowadays 943,000 to 1,006,000 Fmks. annually per regular class and 655,000 to 733,000 Fmks. per parallel form. In addition, the schools receive state grants for teachers meeting certain conditions and 40–60 per cent of the interest on mortgage loans on school buildings and grounds, of rental costs, heating and lighting expenses and the regular wages paid employees. In the scholastic year 1956/57 each pupil in private secondary schools cost the State a total of 37,000 Fmks. Private secondary schools also receive grants from the communes whose secondary educational needs they serve. The size of such grants, which are not prescribed by law, varies greatly among the different communities, being on the average 3,000 Fmks. per pupil each year. In the scholastic year 1956/57 state grants sufficed to cover an average of 66.7 per cent of the expenses of private secondary schools, while tuition fees covered 25.4 per cent and communal grants 5.8 per cent.

The communal junior secondary schools are subject to the legislation governing primary schools in regard to their economic position. In the scholastic year 1956/57 the total cost per pupil in these schools was 54,450 Fmks., of which the share of the State came to 37,900 Fmks., the communes paying the balance.

According to the new Vocational Education Act, the communes receive state aid to cover 65 per cent of the actual vocational school costs provided for by law. Other vocational schools are likewise supported by grants from the Government, provided certain conditions are satisfied. The State also assists in the building of vocational schools and associated pupils' dormitories and teachers' residences, according to principles confirmed by the Council of State. The expenses entailed in establishing central vocational schools belonging to the State are shared by the State and the participating communes in proportions prescribed by law. Appropriations are set aside each year in the state budget to pay out special grants to the poorest communes in the land to help cover the establishment and maintenance costs of general vocational schools.

Costs of classrooms and equipment. The building and enlargement of state secondary schools depend on the appropriations set aside for the purpose in the state budget. The great increase since the war in the need for secondary schools, which has been a consequence of the large age-groups reaching secondary school age, together with a desire to raise the general educational level, has made it imperative to augment the secondary school building programme. Since 1954 about half the state secondary schools have received a new building or an extra wing. The revision of the curriculum to include practical subjects has necessitated the acquisition of special premises for their instruction. Special premises have also been needed for club activities and the serving of school meals.

Building activity has also been lively in the private sector, being financed through loans, which the Government has been able to provide to a limited extent. The schools have therefore been obliged to turn to many different creditors, and in order to meet interest and amortization charges, they have had to raise tuition fees. To help private secondary schools in outlying districts which have been confronted with the worst difficulties, the sum of 150 million Fmks. was included in the 1959 state budget, to be paid as extra scholastic grants. So far it has not been possible for the Government to give aid toward augmenting the school facilities, classroom equipment and libraries of private secondary schools.

The costs of the building projects of communal junior secondary schools are shared by the State and the communes in accordance with the provisions of the laws governing the primary school system.

Teachers' salaries. Teachers are paid according to the same scale in both state and state-subsidized private secondary schools. There are varying stipulations regarding the salaries of regular, special and hourly teachers.

The highest category of teachers in state secondary schools—posts maintained only in normal lyceums, which train teachers for secondary schools—belong in the 31st wage class (basic salary 76,775 Fmks. and final salary 108,575 Fmks. a month), their teaching duties involving 18 class hours a week. The next category, who are required to teach for 24 class hours a week, are in the 29th wage class if on the staff of a senior secondary school (69,775 Fmks. a month and final wage 95,850 Fmks.), and in other secondary schools the 27th (63,550 to 85,450 Fmks. a month). The junior teachers in a normal lyceum are in the 28th wage class (66,600 to 90,425 Fmks. a month), in other schools in the 25th (57,750 to 76,775 Fmks. a month), the teaching duties involving 26 class hours weekly. After 10 regular years of service, the wage class rises one step. The teachers of practical subjects belong to different wage classes: for example, a gymnastics teacher in a co-education senior secondary school is in the 21st wage class (basic salary 47,600 to 63,550 Fmks. a month) and his duties involve 21 hours a week, while the teacher of drawing in an intermediate school is in the 10th wage class (29,600 to 38,400 Fmks. a month) and has 12 hours' teaching a week. In addition, the remuneration paid to all teachers includes so-called 'expensive locality allowances'. A principal receives a basic salary three stages higher than he would receive as a teacher. Teachers are also entitled to claim compensation for work done outside class, the correction

of note-books and the care of collections. Where the sum of regular class hours and hours of work at home exceeds the basic number of hours involved in teaching duties, teachers are paid for overtime.

The salaries of communal junior secondary school teachers are based on the same scale as those of teachers in state junior secondary schools.

The salaries and teaching duties of teachers in vocational schools differ according to the type of school, but on the whole their salaries correspond to those of teachers in general secondary schools.

Tuition fees. The costs borne by parents to educate their children vary considerably, depending on what secondary school is attended. There is room for choice only in large communities. In the most favourable position are the pupils of communal junior secondary schools which, like the primary schools to which they are attached, charge no tuition fees. The pupils of communal junior secondary schools enjoy other substantial social advantages, too, as will be explained further on. Under the present regulations, however, such schools can generally be founded only in poor and remotely situated communes.

The secondary school proper is not free of charge to pupils. State secondary schools charged a tuition fee of 10,000 Fmks. a school year in 1958/59, while in private secondary schools the fee ranged from 10,000 to 40,000 Fmks. Brothers and sisters are granted reduced fees in both state and private secondary schools. Exemptions from fees are also granted; in state secondary schools the number of exemptions is decided by the parents' council, in private ones the figure is at least 10 per cent of the total enrolment.

Vocational education maintained by the State is financed out of government funds, though in special cases tuition fees are charged. The following are some figures relating to the net costs per pupil in 1956 as borne by the various types of vocational training institutions (state and private schools combined): vocational schools, 74,288 Fmks.; technical schools and institutes, 68,019 Fmks.; commercial schools and institutes, 33,169 Fmks.; schools of navigation, 123,632 Fmks.; agricultural schools, 132,288 Fmks.; cattle-breeding and dairy schools, 75,376 Fmks.; gardening schools, 159,040 Fmks.; household economy schools, 81,343 Fmks.; schools for domestic arts and crafts, 76,190 Fmks.

Scholarships. Each year the State distributes grants for aiding gifted, industrious and poor pupils. These scholarship grants are given mostly to pupils in the senior secondary grades, but pupils in the two upper grades of junior secondary school are also eligible. The size of a grant depends on whether the recipient lives at home or has to board in the locality of the school. The State distributes scholarships and makes available loans without interest to pupils of limited means who attend school for the purpose of training for some vocation.

Buildings and equipment. The building projects of state secondary schools are submitted to the Central Board of Schools for approval from the educational point of view, while the Central Board of Building is responsible for the technical side—drawing up the plans and carrying out the construction work. The Central Board of Schools also issues instructions regarding planning and furnishing for private secondary schools. In order to save space, numerous schools have adopted the so-called subject class system. The average classroom measures 63 square metres in area and 226 cubic metres in volume, the gymnasium measuring 13 by 26 metres or 14 by 28. Where the subject class system has not been applied, an attempt has been made to reserve the necessary special rooms for gymnastics, household economy, natural history and natural science as well as for the pupils' library and dining room.

School welfare services. A special annual appropriation is reserved for the health services of state secondary schools. It enables the pupils of the lowest, the fifth and the highest grades to be examined each year. Also, private secondary schools have a school physician and the health service is organized on the same lines as in state schools.

In the majority of secondary schools a meal is served daily. Efforts are made to keep the price low, 20 to 50 Fmks. a meal.

Pupils travelling to and from school by train or bus are generally granted reduced fares.

Numerous schools have scholarship funds for distribution according to the wishes of their donors, usually to assist gifted and under-privileged pupils.

TYPES OF SECONDARY EDUCATION

Children who have not sought to be admitted to secondary school after being promoted from the fourth grade of primary school receive a second stage of education by attending the citizens' school. This comprises a 2-year course based on a 6-year ordinary primary school curriculum, but it may, if conditions so require, be confined to a 1-year course when the primary school has covered a 7-year course.

A primary school may, on certain conditions, include junior secondary grades; these correspond, as regards their curricula, to the state junior secondary school. Communal junior secondary schools consist of 5, 4 or 3 grades and are based correspondingly on courses of 4, 5 or 6 years at the primary school level. Pupils enrolled in communal junior secondary schools are charged no tuition fees, and in addition they enjoy all the social advantages possessed by primary school pupils: free textbooks and other school supplies, allowances for travel and lodgings, school meals, etc.

It is the duty of the primary school also to encourage and assist school leavers in obtaining further education and in pursuing their cultural interests. Toward this end, clubs and study circles may be organized and courses held for the benefit of these young people. (See section 'Out-of-class activities' below.)

The majority of the secondary schools are based on a 4-grade primary school course, although some begin after a 6-grade primary course, their junior stage consisting of 4 grades. The so-called 'new type' secondary schools founded earlier for experimental purposes and based on a 6-year primary school curriculum had a 3-grade junior secondary stage. Pupils studying in these schools had difficulties, particularly as regards foreign languages, and they have by and large been converted into 8-grade secondary schools with a junior secondary stage of 5 grades.

Instead of continuing his studies in a citizens' school or a junior secondary school, a primary school pupil may also transfer to a preparatory vocational school with a 2- or 3-year course. As already mentioned, the Vocational Education Act which came into force at the beginning of 1959 provides for the conversion of these preparatory schools into general vocational schools, based on the curriculum of the citizens' school. A graduate of a citizens' school may also enter a technical school or a commercial school or a lower trade school in the fields of agriculture, domestic arts and crafts or household economy. Graduation from junior secondary school is a requirement for admission to a commercial institute, technical institute or other vocational institute, but in many cases these institutes will also admit graduates of a vocational school at a lower level.

Guidance. Since a pupil usually enters secondary school at the age of 11, he and his parents must make the decision regarding this step primarily on the basis of his success in primary school. The primary school teacher gives the pupil who wishes to enter secondary school not only the standard certificate but also a special statement indicating his standing in class and the teacher's estimate of his chances of succeeding in secondary school work. Since secondary school pupils pay tuition fees and lack the social benefits enjoyed by primary school children, the decision to seek admission to secondary school depends also on whether the child's parents have the financial means. However, gifted pupils of limited material resources are given the opportunity of gaining exemption from tuition fees or at least having the charges reduced.

Regular vocational guidance is given in citizens' schools only but in numerous secondary schools some advice on choosing a vocation is given to pupils in the highest junior secondary grade.

The school year. The school year of the citizens' school consists of 200 working days between 1 August and 31 July, and is divided into autumn and spring terms. Classes begin on 1 September and end on the last weekday of May. The working week is 6 days and each day has 5 or 6 class hours; the number of class hours a week is thus 30 to 36.

The secondary school year opens on 1 September and ends on 31 August. There are two terms, the autumn term beginning on 1 September and ending on 31 December, the spring term running from 9 January to 31 May. The number of class hours devoted weekly to compulsory subjects varies, according to the classes and type of school, between 31 and 35. There is a summer vacation of 3 months, 20 days at Christmas and 'skiing holidays' of 7 weekdays. The number of workdays a year in secondary schools is around 190.

Other schools at secondary level

In addition to these types of schools, mention should be made of night secondary schools, the study circles of primary schools, correspondence schools, folk high schools and workers' institutes.

The night schools observe the curricula of other secondary schools, except that their number of class hours is smaller, 2–3 hours each evening, and that part of the instruction is carried out in the form of tests. Admission to night secondary school requires that the pupil be 15 years of age or more.

Correspondence schools offer very many different courses, covering both general and vocational subjects. Recently steps have also been taken to experiment with collaboration between correspondence schools and secondary schools in order to enhance the study opportunities of young people living in remote communities.

Folk high schools (66 of which use Finnish as the medium of instruction and 17 Swedish) are 1-year boarding schools, which provide young people, particularly in rural areas, with an opportunity to enlarge and deepen the knowledge acquired in primary school. The period of work is usually from the beginning of November to the end of April. Pupils are charged a fee for board and lodging, but study grants are awarded to pupils of limited means. Graduates of folk high schools may pursue further studies in people's colleges, which are also boarding schools.

The workers' institutes are educational institutions holding classes in the evenings and on Sundays. While programmes vary greatly according to local conditions and needs, the curricula cover both general and vocational-type subjects, and endeavour always to include social studies. Workers' institutes, which are maintained by communes and various associations, do not award certificates or diplomas except in special cases, and do not hold entrance examinations. The tuition fees are small and it is possible to gain exemption.

The folk high schools and workers' institutes, however, largely fall outside the sphere of secondary education, properly understood, as the minimum age limit for admission is 18 years.

Vocational and technical education

A summary of the various types of vocational and technical institutions has been given above in the description of the educational system as a whole. These institutions are grouped below according to the nature of the training given. Within each group the institutions are at two levels: 'schools', based on completion of the citizens' school, and 'institutes', based on junior secondary or on the corresponding vocational school.

Vocational schools of industries and trades. The ordinary vocational schools (general vocational schools and special trade schools) and the apprenticeship schools admit pupils aged 15 and offer courses of 2 to 4 years (2 to 3 for general vocational schools). The Industrial Arts Institute (3-year course) requires entrants to be at least 16 years of age. Various courses are available at the Institute for the Promotion of Vocational Skills, where the age of entry is 18.

Technical education. Technical schools offer 3-year courses to entrants aged 17. Technical institutes, with 4-year courses, admit pupils who are 18 years of age.

Commercial education. The part-time schools for sales personnel (night school) and the commercial schools offer

2-year courses for pupils aged 15. Commercial institutes have a 2-year course for entrants from junior secondary or commercial school and a 1-year course for students who have matriculated from senior secondary school.

Schools of navigation. A 3-year course for entrants aged 17. There are also schools with a 6-month course which prepare for the master's certificate.

Agricultural, forestry and fishery schools. Lower agricultural schools include schools for farmers and small-holders, and stockbreeding, dairy and horticultural schools. Entrants must be 17 or 18 years old. Length of course varies from 5 months to 2 years according to type of school.

Courses at the various agricultural institutes last 2 years (1 year for cattle-breeding institute).

Forestry and sawmilling schools have 2- and 1-year courses respectively; entrance age is 18.

Fishermen's schools have a 6-month course; entrance age 17.

Home economics. Institutions at the lower level include domestic science schools (1 year), schools of household economy (5 to 7 months) and schools with courses in home-making (4½ months); entrance age is 17.

Teacher training institutes in home economics have a 2-year course for entrants, aged 19, who have passed their matriculation examination, and a 1-year course for those, aged 20, who have completed junior secondary or domestic science school.

Arts and crafts. The Helsinki Institute of Arts and Crafts admits to its weaving school (1 year), handicraft school (1 year) and vocational departments (2 years), pupils aged 16. There is also a teachers' department (2-year course), entrance to which is based on matriculation or 1 year of handicraft school.

There are men's and women's schools of domestic arts and crafts, both kinds admitting pupils from age 16. Courses in 'stationary' schools last 1 or 2 years; in 'mobile' schools 7 months. Institutes of domestic arts and crafts admit pupils aged 18 and have a 3-year course.

Teacher training schools

Primary school teachers in Finland are trained in teacher training colleges (*seminaari*). For primary school graduates the period of training, including the preparatory course, is one of 6 years, and for graduates of junior secondary school, 4 years. Matriculated students are given the opportunity to finish the course in 2 years at the Jyväskylä Institute of Pedagogics and at teachers' colleges. The colleges include in their curriculum primary school administration, music, librarianship, as well as, on a compulsory basis, a second language and, on an optional basis, a third language. The curriculum in higher institutions includes pedagogical subjects, primary school administration, music, fine arts, librarianship, as well as enlarged and deepened study of subjects in the primary school curriculum not generally included in the senior secondary school syllabus. A notable portion of the preparatory period is devoted in all the institutions to practice teaching.

Teachers of household economy, girls' handicrafts and domestic arts and crafts, are trained in specialized institutes or schools, teachers of drawing and writing by the Teachers' Department of the Industrial Arts Institute, and teachers of music by the School Music Department of the Sibelius Academy. Vocational school teachers are trained at the vocational teacher training institutes.

Other specialized schools

Musical instruction on the highest level is concentrated in the Sibelius Academy, which has an elementary school, a conservatorium, an advanced school, and departments of school music, church music and military music. The elementary school is intended exclusively for children between the ages of 7 and 15; applicants for admission to the department of church music or the conservatorium are required to have a junior secondary school certificate or a corresponding education, ability to play some instrument and a knowledge of the fundamentals of the theory of music. Admission to the conservatorium also depends on an entrance examination.

For the study of the fine arts there are the Drawing School of the Finnish Art Society and the Institute of Industrial Arts, which has a department of vocational training and one of industrial arts.

Out-of-class activities

The extra-curricular activities of primary school pupils usually lead to the establishment of various clubs under the direction of the teachers. After receiving their certificates of graduation old pupils may continue to attend school club meetings and festivals as well as to participate in courses organized expressly for their benefit. They are also offered the opportunity of making use, after leaving school, of the school library and reading room.

The extra-curricular activities of pupils supplement in an important way the educational programme of secondary schools. The most conspicuous expression of such activities is given by fraternal associations which endeavour, through their meetings, clubs, excursions and festivals to foster the social development of members, to accustom them to co-operative effort, give them experience in appearing in public and afford them opportunities to pursue their special interests. The fraternal association of each school elects its officers each year. The associations of the different schools have banded together nationally as the *Teiniliitto* of Finland, which each year holds meetings, courses and competitions, e.g., in music, elocution and dramatics. The fraternal associations of the Swedish-language schools have a corresponding national federation.

There are many different kinds of school clubs, such as athletics clubs, Bible circles, language clubs, mathematics, physics and chemistry clubs, literature, music, art, drama, hiking, camera and chess clubs. Most secondary schools have a temperance society.

TRENDS AND PROBLEMS

The expansion of citizens' schools, required as a result of recent legislation, demands considerable work by both

communal and state educational authorities. A total of 150 communes (about 27 per cent of all the communes in the country) at present have a citizens' school operating as a day school. The most serious obstacle to developing the citizens' school is the expense, mostly incurred in procuring the necessary premises. Lively building activity, however, is now going on. Satisfying the need for teachers in the citizens' school is also an immediate task, and one requiring special measures. Two possibilities have appeared: to provide primary school teachers with special training to assume the duties of teaching in the citizens' school, or to prepare specially qualified personnel for such duties by arranging to give them teacher training courses. Both methods have in fact been used.

The steady growth of secondary education, which is due not only to the entry into secondary schools of the large age-groups born after the war but even more, perhaps, to the generally felt need to raise educational standards, has compelled the school authorities to focus their attention on the provision of more accommodation. Although the establishment of new secondary schools and the expansion of old ones continues at a brisk pace, the maximum number of pupils per class has had to be provisionally raised as high as 44. However, the hope is to lower this limit, which used to be 40, and to divide classes into smaller groups for intensified study in more subjects than ever.

Steps have been taken to make teacher training more effective, especially in respect to general pedagogical training. Toward this end a preparatory course and college activities have been joined to practice teaching. It is planned to extend practice teaching over three terms, one of which would be carried out outside a normal lyceum.

Internal reform of the secondary school has been slower. Revision of the curricula is under way and in certain respects has already been realized. Progress has been such that practical subjects now have a firm place in the curriculum of the junior secondary grades. On the part of private secondary schools a tendency has been perceived to draw up syllabuses to meet the requirements of the economic life of the vicinity of the school as far as possible. Thus a division of courses has been brought about as early as the upper grade of junior secondary school, and in certain cases even at grades 2 or 3. The demarcation line falls expressly in the sector of practical type subjects. Thus, in the commercial course book-keeping and typing are among the subjects taught; in the technical course, mathematical and technical subjects are given particular emphasis; and in the agricultural course elementary instruction in farming is given. The purpose of these special courses is to give pupils basic knowledge of the particular subject matter, in addition to the regular junior secondary school subjects, and thereby to prepare them for entry into vocational schools in various fields. On the senior secondary level, a division into language and mathematics courses has been carried out in state secondary schools and in all the larger private secondary schools. Pupils following either course are obliged to study the second national language, in addition to their mother tongue (Finnish or Swedish), and two foreign languages, not counting the extra language imposed as a compulsory subject on pupils following the linguistic course.

Experimentation aimed at developing teaching methods is carried on especially in a few private secondary schools. The first state experimental secondary school was scheduled to open in the autumn of 1959. Questions to be investigated will include the co-ordination of instruction of different subjects, the regulation of the work of pupils and the fitting of club activities into the school programme of study and instruction.

Vocational guidance is gaining a firm place in school study programmes. Since 1958, in about fifty state secondary schools one hour a week of vocational guidance has been given experimentally to the pupils in the highest grade of junior secondary school. A vocational guidance liaison instructor has worked in close collaboration with the personnel of the communal vocational guidance office. The favourable experiences gained so far promise to establish this type of instruction on a permanent footing in the curricula of secondary schools.

The question of secondary school examinations has stimulated considerable discussion. The secondary school entrance examination is drawn up according to the edict issued in 1954, whereby the factors affecting the chances of the applicant for admission include the success achieved in primary school, the results he scores in the entrance examination and the estimate of his qualifications made by his primary school teacher. The aim is to devise a system whereby such pupils might be admitted as possess the qualities necessary to succeed in scholastic work. Reform of at least certain parts of the matriculation examination has also become a topical issue. Strengthening the position of mathematics in this examination is especially being demanded. The question of holding a new examination between the junior and senior secondary school grades has been under consideration. This has been regarded as necessary because it would give pupils enrolled in schools with only the junior stage the same opportunity to continue their studies at the senior secondary level as the pupils in schools where the transfer from junior level to higher grades is made under the same roof. It is also hoped that by means of such an examination it would be possible to steer into the senior secondary stage pupils capable of grasping relatively theoretical studies, while pupils displaying practical talents could be guided into vocational schools.

There are not nearly enough vocational training institutions to meet current needs. This in part explains the large number of applications for admission to secondary schools. The law relating to vocational training institutions, which came into force at the beginning of 1959, imposes on municipalities and boroughs the obligation to establish vocational schools or to reserve a stipulated number of places for pupils in a state central vocational school. The communes are bound to undertake these measures in such a way that the vocational schools might begin operations at the latest by 1962.

Reform of the school system has been a topic of discussion in Finland throughout her period of national independence. In 1956 the Council of State appointed a committee composed partly of educators and partly of representatives of the various political parties to draw up an educational policy for the near future and to co-ordinate the different reform plans. This Educational Programme Committee

completed its report in the summer of 1959. It comprises three parts:

Part I deals with the present Finnish school system, and includes abundant statistical data.

Part II outlines a new school system, organized in the main along uniform lines, which would consist of a 9-year compulsory school combining the present primary school, the citizens' school and the junior secondary grades, and introducing a differentiation of courses in the upper stage, a 3-year senior secondary school offering elective courses and various vocational training institutions.

In Part III the committee sets out the measures that need to be taken promptly in order to overcome present shortcomings and defects, but which would not hamper an eventual reform of the school system. Believing that it is not yet practicable to introduce a unified school ladder, the committee has made many recommendations within the present system of diversified school types. Thus it proposes that the communes be granted the right to expand the citizens' schools to a course of 3 years, whereby the period of attendance would lengthen out to 9 years; that more subjects be introduced into the curriculum of the citizens' school in order to raise the level of theoretical instruction; and that the establishment of communal junior secondary schools be permitted in other than poor and out-of-the-way communes. A broadening of the scope of instruction at the junior secondary stage is advocated by the committee, which also recommends a moderate division of courses in junior secondary schools, in particular to improve the quality of instruction given young people displaying practical talents and interests. Exempting junior secondary schools from tuition fees is regarded as an objective to be attained gradually, by expanding the communal junior secondary school and augmenting the social advantages offered by other junior secondary schools. A particular objective would be to obtain the benefits of junior secondary education for rural communities. Also the establishment of senior secondary schools in rural areas is a matter the committee considers of singular importance. The syllabus of senior secondary schools ought to be broadened by introducing more elective subjects, and toward this end the curriculum ought to be divided into core subjects compulsory to all and optional subjects. More vocational schools should be established and their curricula should be expanded to include the mother tongue, social studies and foreign languages, so that they might form a graded system leading up to the university level.

The committee draws particular attention to the need to improve educational work, and it stresses the necessity of enhancing the pedagogical and didactic training of teachers. It is proposed that faculties of education be established in the universities for the pedagogic training of secondary school teachers and the teachers of special subjects in primary school. It is also proposed that the administration of schools be improved by establishing in the Central Board of Schools a department of planning and experimentation and a department of teacher training, that regional school administration be developed and that the local administration of schools be centralized.

STATISTICS

Population (mid-year 1958 estimate): 4,376,000.
Area: 130,120 square miles; 337,009 square kilometres.
Population density: 34 per square mile; 13 per square kilometre.

Summary of school statistics, 1953–57. In 1957/58, total enrolment was about 850,000, not including adult education. This represents a school-going population equal to 20 per cent of the total population. Of these pupils 73 per cent

were in primary schools; 19 per cent in general secondary schools; 5 per cent in vocational secondary schools; 0.4 per cent in secondary and higher teacher training schools; 2 per cent in general and technical institutions of higher education.

The proportion of girls was the highest in secondary education—52 per cent as against 48 per cent in primary education. On the other hand, the proportion of girls in higher education was 41 per cent.

The proportion of women on the total teaching staff was high: 62 per cent of teachers in primary schools, 61 per cent in general secondary schools, 52 per cent in secondary teacher training schools, 46 per cent in higher teacher training institutions. (See Table 1.)

Enrolment trends in secondary education, 1930–57. The secondary enrolment ratio, obtained by relating the average enrolment to the estimated population 15–19 years old, was 59 for 1955–57 as compared with 21 for 1930–34. This increase comes mainly from enrolment in general secondary education which is expanding more rapidly than other types of secondary education. Thus, enrolment for 1957 in general secondary schools represented 77 per cent of the total secondary enrolment, as compared with 72 per cent for 1930; in vocational schools the proportions were 22 per cent in 1957 and 26 per cent in 1930; and in teacher training schools 1 per cent in 1957 and 2 per cent in 1930. (See Table 3.)

Examination results in secondary education, 1953–57. The diversity of vocational schools examinations and the fact that their preparation requires less time than those of general secondary schools explain the big difference between the data concerning these two types of education. By relating the number of certificates granted to the number of children enrolled in schools, we obtain a rate of 4 per cent in general schools and of 44 per cent in vocational schools.

In teacher training schools, the proportion of girls enrolled and the proportion of girls receiving certificates decreased from 1953/54 to 1957/58. This period is too short for any conclusions to be drawn. (See Table 2.)

Educational finance, 1957. In the fiscal year beginning in January 1957, total current expenditure on education amounted to 29,585 million Finnish marks. This amount represents an average expenditure of 6,820 Fmks. per inhabitant. (See Table 4.)

FRANCE

THE EDUCATIONAL SYSTEM

The Preamble to the Constitution of 27 October 1946, which is confirmed by the Preamble to the Constitution of 4 October 1958, declares: 'The nation guarantees to children and adults equal access to education, professional training and culture. The establishment of free, secular, public education at all levels is a duty of the State.'

In conformity with this declaration, only public educational institutions are under the authority of the Ministry of National Education; however, private schools belonging to individuals, organizations or religious communities are subject to supervision by the inspectors-general of public education.

Role of public authorities

The services responsible for schools and, in more general terms, for all cultural activities (arts, literature, science, popular culture and sport) are organized in accordance with the system of centralization common to all branches of French public administration; they are subordinate to a minister, whose department comprises a certain number of offices or bodies which constitute the central administration, that is, the Ministry of National Education.

The Minister, who holds political office, is responsible for planning the organization of the schools and studies and takes decisions in the last resort on all matters affecting the national educational system.

Ministerial authority is more or less extensively delegated to regional and local officials, who transmit and execute the instructions of the central body.

For purposes of school administration, France is divided into 17 regions (*académies*), at the head of each of which there is a regional director of education (*Recteur*) who is at the same time the chairman of the University Advisory Council for Higher Education (*Conseil de l'Université*) and the representative of the Ministry in his region; the *Recteur* is a university professor. The Minister and the regional director are represented in the head town of each *département* by a chief education officer (*Inspecteur d'Académie*), who is in charge of all the services of the Ministry of National Education in his *département*.

This close centralization is tempered by the intervention at all levels, of partly elected bodies (councils, committees and commissions), which are consulted by the Minister or by senior officials acting on his behalf before any important decision is made in regard either to the regulations or to matters affecting the individual.

The diagram on page 479 shows the structure of the school system.

THE DEVELOPMENT OF SECONDARY EDUCATION

The present structure of French education is the result of its historical development. Just as the civil power gradually replaced the religious authority in the political field, so too it tended to replace the Church in education, where the Church formerly had a *de facto* monopoly. The notion of 'education as a function of the State' was proclaimed in the eighteenth century by the Philosophes, and the law-makers of the French Revolution, in laying down the organization of 'public education for all citizens' decreed, that this should be 'free as regards the educational subjects essential to all' and should be 'divided into three progressive stages'.

To replace the *collèges* of the Jesuits, which had provided secondary education before the Revolution, the Convention set up *écoles centrales* (central schools). In 1802 the Consulat replaced these *écoles centrales* by *lycées* (state secondary schools). The terms *lycée* and *collège* are still used to denote establishments which provide a classical secondary education. Vocational and technical secondary education is provided by the technical sections of the *collèges* and *lycées*, the technical secondary schools (*collèges techniques*) and the vocational schools (*écoles professionnelles*).

The term 'secondary education' can be taken either in a broad or a limited sense. The broad sense is that which was intended by the pre-war reformers who wished to substitute for the traditional 'orders' of education (*ordres d'enseignement*), in which the primary, secondary and technical 'orders' formed parallel and partly concurrent ladders, a system of progressive levels of education (*degrés d'enseignement*), in which secondary education, or rather instruction at secondary level, is given in schools which admit children at the end of their basic or primary education (at about the age of 11 years) and keep them until the beginning of higher education (that is, until the age of 18 years).

In 1937 the Directorate of Secondary Education (*Direction de l'Enseignement Secondaire*), which had traditionally administered the public schools belonging to the secondary 'order' (*lycées* and *collèges*) and supervised the private secondary schools of similar type, was renamed the *Direction de l'Enseignement du Second Degré;* the upper primary schools (*écoles primaires supérieures*), which had formerly come under the Directorate of Primary Education, were now brought under the Directorate of Secondary Education and later converted into *collèges modernes* (Act of 15 August 1941).

It remained customary, however to keep the term 'secondary school' (*établissement d'enseignement du second degré*) for establishments which came under the Directorate of Secondary Education: that is, the *lycées* and *collèges classiques* (traditional secondary education) and now the *collèges modernes*. The present trend, embodied in the educational reform, is to extend the broad use of the term

'secondary' to cover establishments which in fact provide instruction at secondary level but belong to another Directorate: that is, the complementary schools (*cours complémentaires*) (Directorate of Primary Education) which will henceforth be known as *collèges d'enseignement général*, and the vocational and technical schools (Directorate of Technical Education).

Legal basis

The secondary education system in France was established by three principal Acts: the Act of 15 March 1850 (*loi Falloux*) which gives the legal definition of *lycées* and *collèges* and prescribes the share in their management to be taken by town and state authorities; the Act of 20 December 1880, which established modern secondary education and secondary education for girls; and the Act of 25 July 1919 (*loi Astier*), which established technical secondary education. After the promulgation of this Act, technical secondary education, which had previously been within the province of the Ministry of Commerce and Industry, became an integral part of the national education system.

Other official measures respecting secondary education

GLOSSARY

NOTE. The accompanying diagram does not record changes in nomenclature under the 1959 reform; these are referred to in the body of the text. For the secondary schools (*lycées* and *collèges*) the numbering of the classes follows the traditional French system, beginning at the eleventh class and going up to the first, which is followed by a terminal class, shown as T, in which the pupil prepares for the second part of the *baccalauréat* (university entrance).

centre d'apprentissage (*collège d'enseignement technique*): vocational training school for apprentices.

classes préparatoires aux grandes écoles: post-secondary classes attached to certain *lycées* and *collèges* for students preparing for the competitive entrance examinations to the *grandes écoles* (see below).

classes primaires: primary classes attached to a *lycée* or *collège*.

collèges: general secondary schools, sometimes with primary classes attached, which are established and partly maintained by local authorities at the level of the *commune*, and which are variously organized to provide classical courses (*enseignement classique*) or modern (*enseignement moderne*) or both.

collège technique: vocational secondary school; 4-year course trains workers who may become foremen, supervisors, etc., 6–7-year course leads to higher technical education.

cours complémentaire (*collège d'enseignement général*): complementary course provided at certain primary schools and corresponding to the lower cycle (first four years) of the *enseignement moderne*.

école d'enseignement moyen agricole: vocational secondary school of agriculture.

école maternelle: pre-primary school, or pre-primary classes attached to a primary school.

école municipale de beaux-arts (*. . . de musique*): municipal vocational training school of fine arts or music.

école nationale de beaux-arts (*. . . de musique*): state vocational training school of fine arts or music.

école nationale professionnelle: vocational secondary school; 5-year course trains skilled technicians, 7-year course leads to higher technical education.

école normale: teacher training college for primary teachers (separate institutions for men and women).

école primaire élémentaire: complete primary school covering the period of compulsory education.

enseignement classique: general secondary course with Latin and optional Greek.

enseignement moderne: general secondary course without Latin.

enseignement moderne court: the lower cycle (first 4 years) of the *enseignement moderne*.

grandes écoles: state higher professional colleges, attached to various ministries, the graduates of which become eligible for the more responsible posts in administration, education, science, technology, the armed forces, etc.

lycées: general secondary schools, sometimes with primary classes attached, which are established and maintained by the central authorities with the assistance of departmental or municipal authorities, and which are organized to provide the classical course (*enseignement classique*), the modern course (*enseignement moderne*) or both.

HIGHER EDUCATION

A. *Études juridiques:* law.
B. *Études littéraires:* arts and letters.
C. *École normale supérieure:* institute of education training secondary school teachers.
D. *Études médicales:* medicine and dentistry.
E. *Études de pharmacie:* pharmacy.
F. *Écoles militaires:* colleges preparing for professional careers in the armed forces.
G. *Études scientifiques:* science.
H. *Grandes écoles scientifiques et techniques —écoles d'ingénieurs:* colleges of science, technology and engineering.
I. *Grandes écoles agricoles ou vétérinaires:* agricultural and veterinary colleges.
J. *Grandes écoles artistiques:* colleges of fine arts and music.

EXAMINATIONS

Agrégation: a competitive examination for recruitment to the higher posts in secondary and higher education.

Baccalauréat: university entrance examination, which is taken in two parts (*1re partie* and *2e partie*) at the end of the sixth and seventh years respectively of secondary education.

Brevet d'enseignement commercial, industriel, hôtelier, social: diploma awarded on the successful completion of studies in commerce, industrial arts, hotel management, social welfare.

Brevet d'études du premier cycle: lower secondary school certificate.

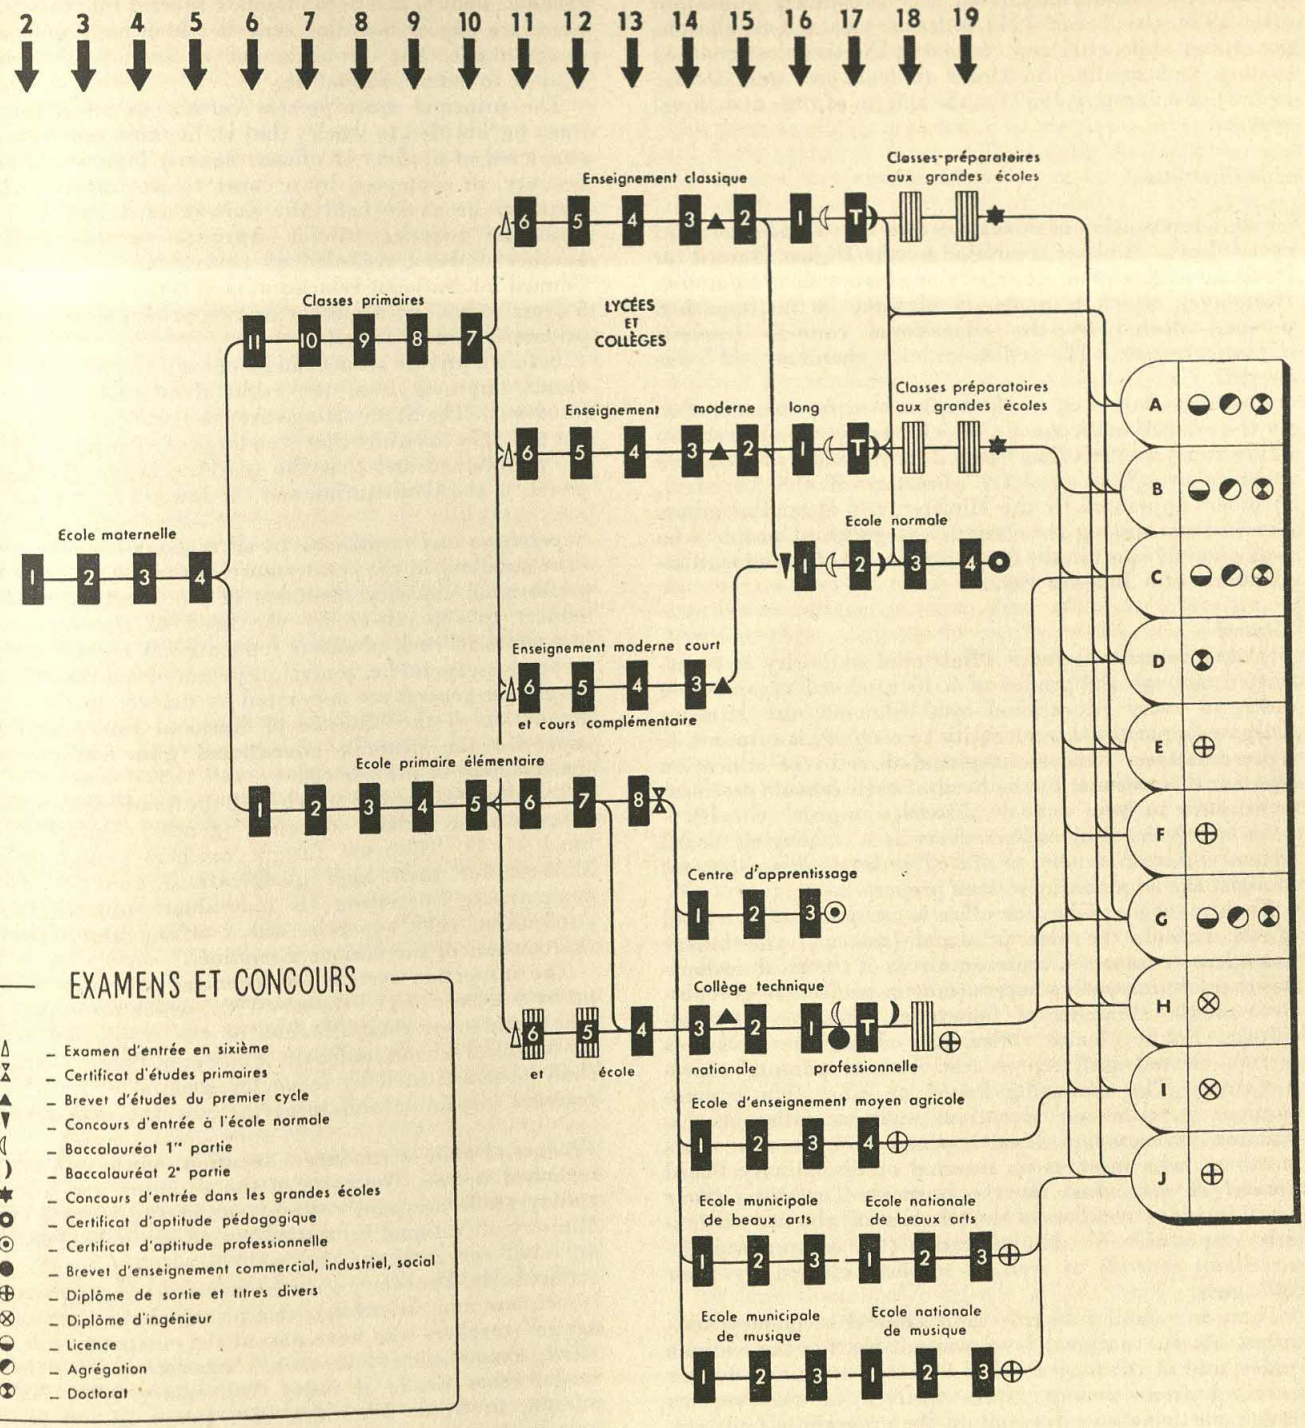
Certificat d'aptitude pédagogique: primary teacher's certificate.

Certificat d'aptitude professionnelle: vocational proficiency certificate.

Certificat d'études primaires: primary school certificate.

Concours d'entrée à l'école normale: competitive entrance examination for teachers training college.

Concours d'entreé dans les grandes écoles: competitive entrance examinations for the *grandes écoles* (see above).



Diplôme de sortie et titres divers: leaving diploma and various qualifications.

Diplôme d'ingénieur: engineering diploma.

Doctorat: doctorate.

Examen d'entrée en sixième: secondary school entrance examination. Pupils in public schools with sufficiently high average mark during primary course are exempt.

Licence: licentiate.

include the establishment of free secondary education after 1930, the Act of 1949 to issue rules and regulations governing apprenticeship centres in the technical training system and finally the Order (*ordonnance*) and Decree (*décret*) of 6 January 1959 for the reform of the educational system.

Administration

In the organization of education and the establishment of curricula the Minister is advised by the Higher Council for National Education (*Conseil Supérieur de l'Education Nationale*), which is made up of some 30 distinguished persons elected by the educational councils (*conseils d'enseignement*). The Minister is chairman of this council.

Decisions, however, are first submitted for consideration by the educational councils, which have great authority in educational matters. The Council for Secondary Education includes *ex officio* members (directors of the Ministry), members appointed by the Minister, and elected members chosen from among the various categories of people who took an active part in the final preparation of the educational reform of 6 January 1959.

Control

Public secondary schools. Ministerial authority is transmitted through the grades of a hierarchical organization down to every educational establishment; the Minister delegates a part of this authority to each of his responsible representatives, from the regional director of education (*Recteur d'Académie*) to the head of each school (*proviseur* or *directeur* in boys' schools, *directrice* in girls' schools).

In the *lycées* and *collèges* there is a managing board (*conseil d'administration*) or office (*bureau d'administration*) to assist the administrative staff proper.

Each managing board or office is composed of the head of the school, the vice principal (*censeur*), the bursar (*intendant* or *économe*), representatives of the local authorities and administrative bodies (mayor, prefect, representatives of the Chamber of Commerce, Chamber of Agriculture, Public Health Office, and chambers of various crafts), elected staff representatives and parents' representatives. The managing board or office can express opinions or wishes on educational matters, although this function has come to devolve primarily on a few of its members, who meet as an internal or disciplinary board (*conseil de discipline*) for the purpose. The disciplinary board includes members of the school staff who are particularly responsible for administration (the *censeur* and the *surveillant général*) as well as teachers elected by their colleagues.

There are similar boards for technical secondary education. At the national level committees for the various trades, and at the local level of technical training advisers recruited from among representatives of the various trades, participate in drawing up the programmes of work and examine the expediency of any decisions made.

Parents' Associations for Public Education maintain permanent liaison with the school authorities.

Private secondary schools. These vary greatly in size. In addition to the large schools, which belong mostly to religious bodies, and accommodate several hundred pupils, there are day or boarding schools which have only a few dozen pupils. The establishment of such institutions is subject to certain formalities.

The principal must possess certain qualifications. He must be 'entitled to teach', that is, he must not have been convicted of a crime or offence against honesty or public decency, or sentenced by a court to loss of civic rights. Further, he must hold the *baccalauréat*, which is the minimum requirement for entrance to university, or another diploma regarded as equivalent by the Higher Council for National Education, and must have completed 5 years' service as a teacher or vice principal in a state or private secondary school.

Before a private school can be opened the principal must obtain approval from the regional education authority (*académie*). The State acting through its inspection services has the right to ensure that standards of hygiene and health are maintained and that the teaching is not contrary to morality, the Constitution and the law.

Supervision and inspection. In all matters connected with their assiduity in the performance of their duties and their professional capacity members of the teaching staff are subject to supervision by the head of the school, the inspectors of each *académie* (educational region) and the inspectors-general i.e. central inspectors from the Ministry. Inspectors-general are appointed by decree, on the recommendation of the Minister of National Education; they supervise the general, educational and administrative management of the schools.

By a Decree dated 12 March 1920 the number of inspectors general of secondary education (general education) was fixed at 49. They are former teachers chosen by the Minister for their high qualifications and professional competence. Specialists in individual subjects of the curriculum, they supervise the teaching and report on the teachers of the various disciplines.

The inspection system for technical education was set up by a Decree of 17 February 1921, which prescribes that 'the permanent establishment of the inspection service for technical schools under the Minister of Public Education shall be constituted by inspectors-general of both sexes, regional inspectors and inspectors for the *départements*'.

Finance. Public secondary education, both general and technical is free. The costs of the teaching and administrative staffs are paid entirely out of the budget of the Ministry of National Education. Secondary school teachers are civil servants and are paid according to the civil service scale. The salary scale for men and women principals (*proviseurs* and *directrices*), vice principals and *professeurs agrégés* (teachers who have passed the competitive recruitment examination known as '*agrégation*'—see below) ranges from Grade 1, index 390, salary 8,930 NF per annum, to Grade 10, index 950, salary 21,760 NF per annum. In the case of teachers who hold the '*licence*' (a degree conferred after two or three years' university study) or a teacher's certificate the corresponding figures are: Grade 1, index 300, salary 6,870 NF per annum; Grade 10, index 705, salary 16,140 NF per annum.

There are certain differences between the various

establishments with respect to their material and financial organization. In theory, public secondary schools are housed in buildings belonging to towns or, very exceptionally, to the *départements*, which are responsible for their maintenance. In practice the State subsidizes the costs of any considerable repairs as well as of new buildings in a proportion varying between 50 and 75 per cent of the expenditure.

The *lycées* are national schools and have their own budgets the income of which is derived from receipts from the boarding school fees (*internat*) and from subsidies, mainly from the State.

The *collèges* do not have their own budgets. Their management expenses form part of the budget of the town or, where necessary, the *département*. Decree No. 55–644 of 20 May 1955, however, permitted the conversion of *collèges* into *collèges nationaux*, or public establishments with the legal status of a corporate body and enjoying financial autonomy. These schools are therefore administratively and financially on an equal footing with the *lycées*, but the *départements* or towns are still responsible for a part of the expenses of management.

The public technical schools are national establishments if maintained by the State and establishments of the *départements* or *communes* if maintained by one or more *départements* or *communes*. Private technical schools may be recognized by the State.

Boarding schools. An original feature of French secondary education is to be found in the existence of large boarding schools (*internats*), sometimes accommodating several hundred pupils. Unless they hold scholarships pupils pay boarding fees, but there are no tuition fees in public schools.

The *externat* (day school) is the teaching establishment proper where the pupils receive class instruction or are accepted for supervised studies. The *internat* is the boarding school, to which are admitted pupils away from their families.

In boys' *lycées* the *internat* is as much part of the state-run establishment as the *externat*. The same applies to the national *collèges*. In the other *collèges* the boarding school section is administratively and financially independent of the day school and may be managed as an undertaking of the municipality (on behalf of and at the expense of the town), or as an undertaking of the *département* (on behalf of and at the expense of the *département*) or of the State (on behalf of and at the expense of the State), or for the account of the principal (at his own risk).

In girls' *lycées* the *internats* were originally a municipal undertaking and remained so until the Act of 10 April 1954 made them state boarding schools.

Scholarships. A *règlement d'administration publique* (public administrative regulation) and a *décret d'application* (decree for the application of these regulations) respecting national scholarships in secondary schools were published in January 1959. These represent merely a first stage in the reform of the scholarship system, which was called for by the commission on democratization of education in 1956 to 1957. The next stages have already been initiated. The first stage introduced a major innovation, which with the tacit agreement of the Ministry of Finance was put into effect ahead of the due date, as from the opening of the schools in 1958: the former boarding, half-board and maintenance grants were abolished and replaced by what is known as the 'equal shares' (*parts unitaires*) system. The purpose of this measure is to distribute state financial aid more equitably in accordance with the resources and expenses of the families, including in the family expenses the additional costs that may be entailed if the children attend a particular school. The 'shares' system was put into operation in October 1958 for pupils entering the 6th class (first year of secondary schooling) and will be extended year by year to the higher classes.

Buildings and equipment. Owing to the constantly growing demand for secondary school premises caused partly by demographic pressure and partly by the extension of school education, the Ministry of National Education has been obliged, in order to keep within its budget, to look for ways of simplifying school buildings and reducing space standards.

Precise standards have therefore been laid down for all the elements of school buildings—day school (*externat*) and boarding school (*internat*) accommodation, administrative services and living quarters. This will make it possible to combine these elements by putting them one on top of another or side by side in various ways without imposing architectural and constructional limitations that would create insuperable difficulties.

A uniform width of 8.75 metres has been adopted for the buildings. For *externats* this means a classroom width of 7 metres and a corridor width of 1.75 metres, the length of the classrooms depending on their purpose. The height of the buildings has been restricted to four storeys above the ground floor, which generally includes the playgrounds, sanitary installations and service quarters, so as to obviate the need for mechanical equipment (lifts and hoists), which for reasons of safety it is inadvisable for children to use.

The Ministry is also investigating the possibility of reducing the amount of floor space per pupil so as to cut down the capital investment required for building the necessary schools. In addition to the urgent necessity for reducing costs there is the further imperative need for rapid building. This requirement is best met by progressively abandoning traditional methods in favour of prefabrication or of the methods used in industrial construction.

School welfare services. A school and university health service attends to the health of all school-age children and of pupils and staff at teaching and educational establishments of all kinds.

The functions of this service include supervision of the further steps to be taken after the school medical inspection, and liaison with all the social services of the administrative departments; control and supervision of hygiene in regard to food and buildings in educational establishments belonging to the Ministry of National Education, Youth and Sport; control and co-ordination of preventive medical services in higher education; and finally, all matters connected with the health of young people at school or university which may be entrusted to this service by the Minister of National Education.

Two inspectors-general, who are medical practitioners, maintain permanent liaison between the Director of Education and the education services of the *académies* and *départements*. In addition, there are school health centres for medical consultation and examination in the chief town of every *département* or *arrondissement*, in every *commune* with more than 5,000 inhabitants and in such other *communes* as may be designated for that purpose by ministerial decree.

Within each secondary school there is a sickroom equipped to give urgent medical attention to any pupil in the school, and with a certain number of beds for sick boarders. The sickroom is under the supervision of a qualified nurse. Every secondary school equipped with boarding accommodation has a school medical examiner and a school medical officer.

TYPES OF SECONDARY EDUCATION

The essential purpose of the educational reform promulgated by the Order and Decree of 6 January 1959 was to bring the different types of secondary education into a unified system and develop the arrangements for giving guidance to pupils, so that on the one hand children would not waste time in studies for which they were not fitted, and on the other hand children who showed aptitudes at a later stage could move from one type of education to another. Guidance councils and 'bridge classes' (*passerelles*) are the original features of this reform.

The character of secondary education will be greatly changed in 1967, since in accordance with the Order of 6 January 1959 it will then become compulsory. The revision of the programmes of study has already been begun.

After the 'elementary education' which will enable all children from the age of 6 to acquire a fund of elementary knowledge and mastery of the basic tool subjects, pupils will enter on an observation period (*cycle d'observation*) lasting 2 years, during which their aptitudes will be observed while they pursue their studies in the normal way.

During the observation period the guidance council (*conseil d'orientation*) will from time to time report its views to the parents. The first term will be devoted to a review of the pupil's knowledge, and at the end of this term a report containing advice which will not be affirmative or negative except in the most obvious cases, may be sent to the parents. At the end of the second term, during which a choice will be made between classical and modern courses, a second report will be submitted. It is at the end of the second year of the observation period that the action of the council will be most decisive for it is then that the child will be really guided towards a specialized form of training, and it is most desirable that the grounds for the parents' choice should not be mere social considerations or prejudices but the true interests of the child.

At the end of this observation period the pupils will be helped in the choice of a course; they may take one of the following: a terminal course arranged with the help of various trades which will last until the end of the compulsory school period; a short technical course at an apprenticeship centre; a short general course at a *cours complémentaire* (to be renamed *collège d'enseignement général*); a long course of technical training at a technical secondary school or a national vocational school (*collège technique* or *école nationale professionnelle*); a long classical or modern course in a classical or modern *lycée*.

Terminal courses. Adolescents who wish to enter an occupation at the age of 16 will be offered several types of terminal course. In the rural districts the commonest type will be an agricultural course (*enseignement agricole*) for boys and a rural domestic economy course (*agricole-ménager*) for girls. These courses will be mainly practical, designed for those who will work on the land. For the benefit of other rural pupils the terminal courses will provide artisan training. In the towns there will be courses offering a similar combination of general instruction and vocational preparation for urban artisans or skilled industrial workers.

Short technical courses. These courses, which must always be organized in such a way that young persons who possess the necessary ability may still have the possibility of transferring to a long technical course, will continue to be given by the apprenticeship centres. In preparing the programmes of work, which will be constantly adapted to the demands of the national economy, account will be taken of the comments and forecasts submitted in the reports of the *Commissariat au Plan d'Équipement et de Modernisation* (Office of the Commissioner for Planning and the Modernization of Industry).

Long technical courses. The long technical courses, which have already been organized with the agreement and help of the various trades, provide a progressive training from the level of an elementary trade qualification to the advanced qualifications required of technicians and engineers. A compulsory period in an undertaking will conclude this training and bring it into line with up-to-date practice. No adolescent, therefore, need stop his training at a point which for the best students can be no more than a half-way stage.

One of the main concerns of the educators has been to provide special sections to act as 'bridges' (*passerelles*) and enable pupils who have completed a general education to receive a vocational training at the level of their previous studies.

Short courses of general education. The purpose of these courses is still to prepare adolescents for employment in one of the numerous medium-level posts of a non-technical or only slightly technical kind in the rapidly expanding 'third level' sector of the economy, and of course for entry to teacher training schools (*écoles normales d'instituteurs*). With the double purpose of simplifying and up grading educational nomenclature, the *cours complémentaires* at which such instruction used to be given will in future be called *collèges d'enseignement général*. The courses will be extended over an extra year to enable students of either sex to reach the minimum age at which they may become candidates for a civil service post or take up employment.

Long course of general education. The pupil can choose between different sections, which are described below. One

of the main changes introduced by the reform is the rearrangement and strengthening of the present 'Classical B' section (Latin and languages). The importance of modern languages in the world of today is obvious but a knowledge of foreign languages is not in itself sufficient—except for the rather limited number of professional interpreters—and the student's linguistic equipment must be supplemented by a knowledge of other subjects.

Organization of secondary school year. The school year starts on 15 September. It is divided into three terms, separated by the Christmas holidays (from 23 December to 3 January) and the Easter holidays (15 days in all). The length of the summer holidays is fixed at two and a half months: 1 July to 15 September. Promotion and leaving examinations must be held during July and finished by 14 July at the latest.

General secondary schools

'Lycées' and 'collèges'. There are 367 *lycées*, of which 23 are in Algeria and 6 in the overseas *départements* (*départements d'outre-mer*), and 548 *collèges*, of which 24 are in Algeria.

The only difference between a *lycée* and a *collège* lies in the way in which they are administered. The *lycées* are national public establishments, founded and maintained by the State with the help of the *départements* and towns. The *collèges* are founded by the *communes*, although members of the staff holding university diplomas in these institutes are always paid by the State.

Lycées and *collèges* offer an increasingly differentiated programme, including technical sections in the upper cycle. The technical sections prepare pupils for the *baccalauréat technique*, which will be referred to at more length under the section 'Vocational and Technical Schools' below: the courses themselves are regarded as essentially part of general secondary education, and are included here so as to give a comprehensive picture of the types of course provided in *lycées* and *collèges*.

The course is organized as follows:

1. A 2-year observation cycle (6th and 5th classes)[1].
2. For the 2 years following this period (the first cycle, comprising the 4th and 3rd classes) there are 3 sections. Classical A section—main subjects: Greek, Latin and one modern language; Classical B section—main subjects: Latin and two modern languages; Modern section—main subjects: a more intensive teaching of French and two other modern languages.
3. For the first 2 years of the second cycle (2nd and 1st classes) there are 7 sections. Classical A section—main subjects: Greek, Latin and one modern language together with a partly optional complementary training (A′) intended to enable the student to proceed later to scientific studies; Classical B section—main subjects: Latin and two modern languages and a general formation tending towards the social sciences and their modern means of expression; Classical C section—main subjects: Latin, the sciences and one modern language; Modern section M—main subjects: the sciences and two modern languages; Modern section M′—main subjects: the physical and biological experimental sciences and intensive study of a modern language; Technical section T—main subjects: the sciences, one modern language and elementary industrial technology; Technical T′—main subjects: orientation of the various courses towards applied economics and two modern languages.

   In the seventh year (third year of the second cycle), a course of general education is given in five sections, including in each section an introduction to philosophy: a philosophy section, an experimental sciences section, a mathematics section, a mathematics and technology section, an economic and social sciences section.

The time-tables and curricula of the sections enumerated above are fixed for each class by an order of the Minister of National Education.

The long general education course concludes with the *baccalauréat*, which is a university degree conferred by the faculties of sciences, letters and social studies. The *baccalauréat* is divided into two parts, the examinations for which are taken at the end of the sixth and seventh years of secondary study. There is a separate 'series' of the *baccalauréat* for each of the sections listed above. In addition, in the first part there is a special series corresponding to the complementary subjects which may be taken in the A course.

The following tables show the distribution of the hours per week among the various subjects in the curricula of the observation cycle, the first cycle and the second cycle, including the final classes, for some of the sections.

Teaching staff. The teaching staff in *lycées* and *collèges* is composed of teachers (*professeurs*) and assistant teachers (*adjoints*). In addition to their teaching duties the assistant teachers are responsible for supervising studies. Special masters in boarding schools (*maîtres d'internat*) and supervisors in day schools (*surveillants d'externat*) superintend the studies, recreation and activities of the pupils.

Secondary school teachers are university graduates, the minimum academic qualification being the *licence d'enseignement*[2]. A young teacher who has obtained his *licence* can be appointed directly to a post as assistant teacher. In order to become a full teacher (*professeur*), however, he must first pass a competitive examination. There are two categories of competitive examination, at different levels: (a) The competitive examination for a certificate of proficiency in secondary teaching (*certificat d'aptitude au professorat de l'enseignement public du second degré*—CAPES) offers the easiest access to the profession. The candidates may sit for the examination in different subjects, which are the same as the subjects for the *licence d'enseignement*. Candidates who have passed the theoretical part of one of these examinations are admitted to a regional education centre (*centre pédagogique régional*) and spend

1. Classes in French secondary schools are numbered in inverse order, i.e. progressively from the 6th to the 1st, which is followed by a terminal class (see diagram).

2. A *licence* usually requires at least 2 years' study at a university. The student must obtain university certificates (*certificats d'études supérieures*) in a number of subjects (3 for science, 4 for letters); the only difference between a *licence d'enseignement* and an ordinary *licence* (*licence libre*) is that for the former the choice of subjects is strictly prescribed.

TIME-TABLE FOR GENERAL SECONDARY SCHOOLS
(in hours per week)

1. Drawing in the traditional classes, plastic arts in the new classes.
2. The additional hour and a half is spent discovering the pupils' artistic abilities. Each half of the class spends $1\frac{1}{2}$ hours in turn on plastic arts and $1\frac{1}{2}$ hours on music.
3. Directed work (new classes only) under the teacher in charge of the subject, by groups of half a class or at least 15 pupils in the case of Latin.
4. Options (new classes only). Each pupil may opt for one or two subjects. One option (Latin, modern language II, preliminary industrial technology) is sufficient qualification for admission to a class in the second period of general education or technical education, subject to the proficiency requirements laid down in the regulations in force at the time.

1 year in teaching practice. At the end of this year they take the practical part of the examination; if they succeed they become certificated teachers (*professeurs certifiés*). (b) Teachers who hold a chair in a *lycée* are selected by means of a competitive examination, called the *concours d'agrégation*, which is of a higher standard. The *concours d'agrégation* exist at present for the following subjects: mathematics (men), mathematics (women), physical sciences (men), physical sciences (women), natural sciences (men and women), philosophy (men and women), literature (men), literature (women), grammar (men), modern literature (men and women), history (men), geography (men and women), history and geography (women), German (men and women), English (men and women), Spanish (men and women), Italian (men and women), Russian (men and women), Arabic (men and women).

Every examination consists of a written and an oral test. The written papers are taken in the head town of each educational region (*académie*); the oral examination is held in Paris. In addition to their *licence d'enseignement* candidates must possess a diploma of higher studies or in place thereof a certificate of higher studies. They must also have completed a course of teaching practice at a *lycée*. The board of examiners, of which the chair is generally taken by an inspector-general of public education or a university professor, is composed of teachers in higher education and *lycée* teachers of outstanding qualifications.

A considerable part of the programme of study for the *agrégations* (above all, in the case of the *agrégations* in science) has, of necessity, a permanent character. The details of the programme, however, may vary from year to year, particularly for *agrégations* in literature, for which different authors may be set each year. For this reason the syllabus for each examination is published one year in advance, immediately after the results of the previous examination.

Teachers holding an *agrégation* (*professeurs agrégés*) make up about one third of all secondary school teachers. They are appointed directly to *lycées* by a Ministerial order. Unless specially exempt, they must undertake, when registering for the examination, to teach for at least five years.

In order to help recruitment for the teaching profession, facilities have been provided for students who are preparing for the proficiency certificate (CAPES) by the establishment of secondary education preparatory institutes (*Instituts de Préparation aux Enseignements du Second Degré—IPES*). The Decree of 27 February 1957 set up an IPES in every faculty of science and literature. Each of these institutes

brings together the pupil-teachers training to be teachers in the *lycées*, classical or modern *collèges*, teacher training schools for primary education (*écoles normales primaires*), state vocational schools (*écoles nationales professionnelles*) and technical secondary schools (*collèges techniques*).

The institute gathers the pupil-teachers together in work sessions outside the courses they follow in the faculties, but does not provide teacher training; its task is to help the students to prepare for their *licence d'enseignement* under the best possible conditions.

Fully qualified teachers (*professeurs*) and in general all staff with teaching duties are required to teach in class for a certain number of hours weekly: 15 hours for a *professeur agrégé*, 18 hours for a *professeur certifié*, 20 hours for a teacher of art or special subject. In Paris these figures are less for a principal teacher in the post-*baccalauréat* classes which prepare pupils for the competitive entrance examinations to the *grandes écoles* (state higher professional colleges), in classes with more than 35 pupils, etc.

The weekly hours of duty of a teacher are calculated so as to give him sufficient free time to prepare his classes, correct exercises and keep abreast of literary and scientific affairs. For this reason the maximum number of teaching hours varies with the size of the class and school and the qualifications of the teacher.

Examinations for teaching appointments are based on specialization. Teaching duties, again, are organized on the basis of specialization. A teacher of literature is in general not qualified to teach anything except Latin, Greek, French literature and French grammar. A modern languages teacher in general teaches only one modern language, a mathematics teacher teaches only mathematics, a natural science teacher only natural sciences and a philosophy teacher only philosophy.

Complementary courses (*cours complémentaires*). These courses, which as their title indicates, were originally intended solely to provide the pupils with complementary instruction to that given in the primary schools, are classes attached to these schools. To this function, which still exists, has been added since the Liberation the further duty of providing a short modern course, similar to that given in the first four years of secondary schools (sixth, fifth, fourth and third classes) but complete in itself.

Admission to *cours complémentaires* is as a general rule subject to the same conditions as admission to *lycées* and *collèges*. The pupils must be between 11 and 12 years of age on 31 December of the year in which they are admitted. Exceptions can be made in favour of children one year below this age or one or more years over the age of 12. Further, pupils who are under 15 years of age and hold a certificate of primary education may be admitted directly into the fifth class (i.e. second year). Candidates admitted under these conditions are eligible for maintenance or full board grants.

Curricula and time-tables in the general education sections of the *cours complémentaires* are in conformity with those of the short modern classes in the *collèges;* they are shown in the following table:

TIME-TABLE FOR *COURS COMPLÉMENTAIRES*
(General education sections—Decree of 24 July 1947)
(in hours per week)

Total	27	27	27	27

1. Girls in class III take at least 1 hour of mathematics in the 2nd and 3rd terms, 2½ hours handwork (cutting) in the 2nd term and 2½ hours mothercraft in the 3rd term.

There are also technical sections (industry, commerce and agriculture), which have grown considerably since the Liberation, have syllabuses and time-tables adapted to local needs and are more in conformity with those at the technical secondary schools (*collèges techniques*). Some of the industrial and commercial sections have been approved by the Directorate-General of Technical Education (*Direction Générale de l'Enseignement Technique*), which assists them by providing teachers for technical subjects and teaching material. These courses prepare students for certificates (*brevets*) in industry and commerce.

Special attention has been paid to the sections for agricultural and rural domestic economy, designed to educate the young in the rural districts who have not received a general or technical secondary education but still wish to acquire the essential qualifications for middle level employment. In agricultural education, as in education for industry and commerce, vocational guidance starts in the fifth class (second year). The BEPC examination is taken at the end of the course, with a choice between agriculture and rural domestic economy.

Teaching staff. The teaching staff for the *cours complémentaires* is recruited from among men and women primary school teachers. Until recently the only qualification required was general professional competence, but in the last few years constant efforts have been made to provide special training for these teachers. Refresher courses have been organized so as to bring together for a few days every year the staff who teach certain special subjects (languages, science) in the *cours complémentaires* in the same educational region (*académie*). Courses of much longer duration have also been organized in certain teacher training schools, or under the auspices of certain university faculties, for teachers of the *cours complémentaires* who are engaged in or training for science teaching for agricultural purposes. Lastly, there are facilities to enable language teachers to spend periods abroad, either as scholarship holders or as assistant teachers.

Vocational and technical schools

I. Industry and commerce

Technical instruction was the last branch of education to be given a place in the school system. Its extension has been due to the growth of industry and the economy, with the changing demands of which, both qualitative and quantitative, it must keep pace. This constant necessity to keep technical education in touch with the demands of employers accounts for the very complicated and detailed nature of the technical branch.

Nevertheless, technical education is planned broadly along the same lines as general education. The structure of the national vocational secondary schools (*écoles nationales professionnelles*) and technical secondary schools (*collèges techniques*) is similar to that of the general secondary schools. They can include sixth and fifth classes which follow the same syllabuses as the sixth and fifth classes, modern section, of *lycées* and *collèges*. Technical education proper starts in the fourth class.

A special feature of technical education is the system of equivalent standards, which enables any pupil coming to a technical school from a general school or from another technical school to transfer to another class or to change to another section by taking special examinations or attending special classes to help him catch up with the work.

The vocational guidance services work in close collaboration with the technical education system. The function of the vocational guidance centres is to help children on reaching the end of the compulsory schooling period to choose a trade suitable to their own bent and abilities, their family circumstances and the exigencies of the labour market. There is complete freedom to follow or not follow the advice given. Vocational guidance centres have been

set up in all *départements*. More than 300,000 children are tested and given advice in these centres each year.

Apprenticeship centres (*centres d'apprentissage*). These schools train skilled manual and non-manual workers for industry and commerce. Pupils are admitted after the last year of compulsory schooling, that is at 14 years of age. The possession of a certificate of primary education is not compulsory. The normal course of studies is 3 years.

The theoretical and practical training given is both general and vocational. Girls are taught domestic science, whatever occupation they may have chosen. The range of trades taught is very wide: metallurgical work, timber construction, printing, electricity, radio, hides and skins, textiles, commerce and the like. At the end of the final year pupils take the examination for the vocational proficiency certificate (*certificat d'aptitude professionnelle—CAP*). This examination includes written, oral and practical tests. The CAP certifies merely that the holder is competent to start work in a trade for which he has completed the elementary apprenticeship but which he can learn thoroughly only through practice.

Technical secondary schools (*collèges techniques*). These schools train highly skilled manual and non-manual workers who, with age and experience, will be capable of becoming foremen and supervisors. Admission is to the sixth and fifth class in schools which have these classes. In order to be admitted to the fourth class the pupil must take an examination which includes dictation, composition, two problems in arithmetic and a subject test, which depends on the course chosen. The normal duration of studies in these schools is four years, starting from the fourth class.

The courses fall into three main categories: industry, economic and social studies, hotel management and catering trades. Some *collèges techniques*, however, also have preparatory classes jointly with the *écoles nationales professionnelles* (see below), and prepare students for the *baccalauréat technique A*, the competitive entrance examination to the state training schools for engineers (higher education) and the technical certificate (*brevet de technicien*).

Normally, the *collèges techniques* prepare students for one or other of the following diplomas:

The *brevet d'enseignement industriel* (industrial certificate), after a 4-year course in a *collège technique industriel*, consisting of two parts, a preliminary examination taken at the end of the second class (third year) and the certificate examination proper, which is taken at the end of the first class (final year). The preliminary examination is designed primarily to test the candidate's general education.

The *brevet d'enseignement commercial* (commercial certificate) is also in two parts. For the first part there is a choice of three subjects—shorthand-typing, commerce, book-keeping; certain tests are common to all three. In the second part there is again a choice between three subjects—secretarial work, commerce, book-keeping. Whatever the candidate's choice he must go through a 3 months' course in one of the business departments of a firm and submit a report on his course.

The *brevet d'enseignement social* (social welfare certificate) again has two parts the first of which does not lead to a diploma. The second part comprises three optional subjects—social secretariat work, medical-surgical secretariat work and social welfare supplies. Whatever the candidate's choice he must go through a 3 months' course in a social welfare or hospital service and submit a report.

In some *collèges techniques* there are special sections to enable students who wish to change their special subject, or who have come from a general school, to prepare for a certificate in industry or commerce.

Technical sections in 'lycées' and 'collèges'; vocational sections in the complementary courses. These have been referred to above under the section 'General secondary schools'. Conditions of entry and educational qualifications for admission are the same as for the technical schools. In most cases, however, the vocational sections in the *cours complémentaires* lead only the first part of the certificates in industry and commerce.

Craft schools (*écoles de métiers*). These establishments, which are also placed on the same footing as the *collèges techniques* as regards conditions of entry and educational qualifications, specialize in preparing students for a certain number of well defined occupations (photography and cinema, carpentry, weaving, building, boot and shoe manufacture, roofing, plumbing, etc.). Many of them were set up by trade organizations or chambers of commerce, which continue to manage them with the participation and under the direction of the technical education authorities.

City of Paris vocational schools. These have the legal status of *collèges techniques*, but their standard is comparable to that of the *écoles nationales professionnelles* (see below). Entrants are generally selected from the second class. The entry examination is open to holders of a BEPC (lower secondary school certificate). Some of these schools are really schools of applied arts, designed to train those who will work in crafts and designing.

National vocational schools (*écoles nationales professionnelles*). These are at a level intermediate between that of the *collèges techniques* and that of the *écoles nationales d'ingénieurs des arts et métiers* (national schools of engineering, which belong to higher education) and prepare students for middle level occupations—manufacturing agents, pattern-drawers, shop foremen, works foremen and technicians.

Candidates are usually selected for entry from the fourth class. They must pass an examination which consists of a dictation, a French composition, an arithmetic test and a geometry test. This examination can also be taken in classes above the fourth class, according to the qualifications or level of the candidates. The course normally lasts for 5 years. There are two optional courses—industrial technology and commercial technology—which lead to a 'certificated student's diploma' (*diplôme d'élève breveté*). Students also have a third choice, the 'technical mathematics' section which leads to the *baccalauréat* in technical mathematics or to the competitive entrance examination

for the National School of Engineering. Apart from practical studies, the curricula of the national vocational schools naturally accord an important place to technical theory as well as to science and mathematics.

In most of the *écoles nationales d'enseignement technique* and in some of the *collèges techniques* there are sections which prepare students for the technician's certificate (*brevet de technicien*). In the professional hierarchy the technician ranks immediately below the engineer. In order to reach the educational level required of him he must undergo a 2- or 3-year course of training over and above the period of his studies at an *école nationale professionnelle* or after he has obtained the *baccalauréat technique* or the *baccalauréat de l'enseignement secondaire* (technical or general *baccalauréat*) (first and second parts). The normal course of study in the sections which prepare students for the *brevet de technicien* is 2 years, but 1 preparatory year is sometimes needed.

The national vocational schools (*écoles nationales professionnelles*) prepare students for the following examinations and certificates:

Certificated student's diploma (*diplôme d'élève breveté*). This diploma is granted to students at these schools who have reached the required standard during their last two years. Special importance is attached to workshop practice and industrial draftsmanship, and a preliminary report is required on these two subjects. The diploma automatically entitles the holder to admission to certain higher educational establishments.

Higher diploma in commerce (*brevet supérieur d'études commerciales*). There are four optional courses for this examination: secretarial work, book-keeping, mechanographical book-keeping, commercial translator. Candidates must hold a certificate of commercial training (*brevet d'enseignement commercial*), for which they are prepared in the *collèges techniques*, or the first part of the *baccalauréat* in economics, for which some of the national vocational schools offer preparatory courses.

Technical certificate (*brevet de technicien*). Preparation for this examination is given in some of the vocational secondary schools (*collèges techniques*) and in the national vocational schools (*écoles nationales professionnelles*). The certificate is evidence of a practical and thorough knowledge of the technical work connected with various special subjects prescribed by ministerial orders. The examination includes practical tests and general educational tests. In certain cases candidates must go through a course in an industrial establishment or laboratory.

Technical baccalauréat (*baccalauréat technique*). There are two optional courses—technical mathematics and technical economics.

Technical baccalauréat in mathematics (*baccalauréat technique mathématique*). Although this is not strictly speaking a technological examination, students can prepare for it in the national vocational schools and in some of the technical secondary schools (*collèges techniques*). It is merely a particular series of the general *baccalauréat* (*baccalauréat de l'enseignement secondaire*), and forms part of the scheme for equivalent standards between general and technical education. It comprises two parts. The first part covers substantially the same syllabus as the modern series. The oral examination includes, in addition, a test in technology. The second part (technical and mathematical series) covers the same syllabus as the elementary mathematics papers, with the addition of a written test on technical drawing, a handwork test and a *viva voce* on technology. The *baccalauréat technique mathématique* gives exactly the same rights as the other *baccalauréats*.

Technical baccalauréat in economics (*baccalauréat technique économique*). Preparation for this examination is confined to a few schools. The examination is a test in intermediate economics, and qualifies the student who has thus acquired a knowledge of the essential economic processes for admission to a university or a state higher professional school (*grande école*).

Vocational courses. These courses are organized 'for apprentices, manual and non-manual workers in commerce and industry and all young persons of either sex, who are under the age of 18 years and are training for an industrial or commercial occupation' (Article 37 of the Act of 25 July 1919 called the *Loi Astier*). These courses lead to a proficiency certificate. The *Loi Astier* lays down that once such a course has been established in accordance with the law, it becomes compulsory.

In general the vocational courses are organized by the *communes* and subsidized by the State. They cannot be placed on the same footing as the vocational training schools. The instruction given is not at a level equivalent to that of secondary education, but is essentially designed to supplement the general and theoretical education of young persons who have left school at 14 years of age to enter an occupation immediately.

Teaching staff

1. *General subjects.* Teachers in public technical schools, with the exception of teachers in higher technical education and in apprenticeship centres, belong to one of two categories—*professeurs agrégés et assimilés* and *professeurs certifiés*.

The *professeurs agrégés*, and teachers placed on the same footing (*assimilés*) are recruited from candidates who have passed the competitive examination for higher posts in secondary education (*agrégation*) and also, but only for subjects peculiar to technical education, from holders of a (higher grade) technical teaching proficiency certificate who are not *agrégés*. For certain special subjects candidates must have spent a certain number of years in the appropriate occupation.

The *professeurs certifiés* are recruited under conditions laid down by the Decree of 9 February 1951: that is, they must hold a technical teaching proficiency certificate (CAPET). This proficiency certificate is granted to candidates who have passed an examination which includes a theoretical part (written papers and one or more oral tests) and a practical part, which need not be taken in the same year as the theoretical part. Candidates for the second part must have had 1 year's teacher training. The CAPET includes the following subjects: mathematics, physics, chemistry, physiological chemistry, applied domestic sciences, building and engineering (engineering industries), building and engineering (building industry), drawing and applied arts, economic sciences and technology (accoun-

tancy), economic sciences and technology (business organization), French, modern languages, history and geography.

Candidates must be of French nationality and must be at least 20 years of age by 31 December and not over 34 years of age on 1 January in the year in which the examination is taken. The upper age limit, however, can be extended under the usual conditions (pensionable civil occupations and national military service). Candidates must hold a teaching certificate or a combination of certificates[1] which meet the requirements for technical education and constitutes a kind of technical licentiate (*licence technique*). Students at the higher technical teacher training school (*Ecole Normale Supérieure de l'Enseignement Technique ENSET*) or institute for preparation in secondary education, as well as holders of certain engineering diplomas, may be exempted from certain tests.

Students are prepared for the certificate of proficiency in technical teaching at an ENSET, or at an institute for preparation for secondary teaching, or by taking a correspondence course with the National Correspondence School (*Centre National d'Enseignement par Correspondance*).

2. *Assistant technical teachers.* These are recruited by competitive examination. Candidates must have spent 5 years in a trade and possess certain diplomas such as a trade certificate (*brevet professionnel*), technician's certificate (*brevet de technicien*), diploma of a certificated student of a national vocational school (*diplôme d'élève breveté d'une école nationale professionnelle*), commercial education certificate (*brevet d'enseignement commercial*).

II. Agriculture

This branch of vocational education is developing as a result of the constant modernization of agriculture. There are three types of course, known as post-school, intermediate and higher training.

Post-school agricultural education. After leaving the primary school, young persons of either sex intending to enter agriculture without continuing other studies must, as a general rule, attend compulsory post-school agricultural courses from the age of 14 to 17 years for 120 hours per year from autumn to spring. The teaching is given at communal or intercommunal centres. Girls take a post-school course in rural domestic economy. The course leads to a certificate in post-school agricultural studies.

Post-school agricultural education comes under the Ministry of National Education but is under the technical supervision of the Ministry of Agriculture.

Agricultural apprenticeship proper is organized in various types of schools. Some of these are apprenticeship centres for agriculture, horticulture or rural domestic economy, and are open primarily to boys and girls from the towns who wish to acquire a practical knowledge of agriculture. The courses last for 2 or 3 years and the pupils live in. The usual qualification for entry is a certificate of primary education. Some of these schools are public but the majority were founded by private organizations and approved and subsequently subsidized by the Ministry of Agriculture.

Other apprenticeship schools are still conducted by private enterprise: these are seasonal schools of rural economy, open for four or five months during the winter, or else family establishments for apprenticeship in agriculture or rural domestic economy open one or two weeks a month for two or three winters.

Intermediate agricultural education. This also is given in various types of school, including seasonal schools and all the year round schools. The boys' schools are under the supervision of the Ministry of Agriculture.

Permanent winter agricultural schools are intended for young persons who have finished their primary studies. The curriculum covers not only agriculture and related subjects but also the more useful general subjects (French, arithmetic, book-keeping, elementary geometry); it also includes manual work (wood and metal). Courses usually last for 4 months each winter during two or three winters.

Travelling agricultural winter schools are intended for young persons who cannot leave their work and also for adults. In practice, these courses consist of successive sessions held in the main agricultural centres of a *département* at the request of the local authorities. The teaching covers the elementary technical outline of agricultural work. Lessons are given once or twice a week on fixed days for several months and deal in particular with agriculture, animal husbandry and livestock hygiene.

Special seasonal courses offer instruction of a mainly practical kind on various technical aspects of agriculture: dairy farming, horticulture, viticulture, sylviculture, orchard work and artificial insemination.

Practical agricultural schools are for young people from 14 to 18 years of age. The course generally lasts for 2 years, and covers both additional general training and a technical agricultural training (general agriculture, animal husbandry, horticulture, viticulture, rural engineering, agricultural technology, agricultural book-keeping and rural economy) and, lastly, a practical training. Most of these schools also have workshops at their disposal for handwork (iron and wood).

Regional agricultural schools are really agricultural secondary schools, which cover a wider and more thorough syllabus than the practical agricultural schools. They are intended primarily for farmers' sons who wish to obtain a full technical training and education at a level substantially equivalent to that of the *baccalauréat* (part one). The courses last for 3 years at the end of which successful pupils receive the diploma of the regional agricultural schools (*diplôme des écoles régionales d'agriculture*). These schools can also prepare their best pupils for the entrance examinations to certain higher educational establishments.

Specialized agricultural schools are agricultural schools in which a special subject takes priority over the general agricultural instruction.

Schools for rural domestic economy provide training in agriculture and domestic economy for girls and equip them for their later role of housewife on a farm or other agricultural establishment. Candidates are not usually required to produce a diploma on admission. They may be either fixed or travelling schools. Sessions last from 4 to

1. Conditions governing diplomas and examinations are laid down by the Orders of 30 September 1959.

9 months, and the instruction given includes the elements of family agriculture (horticulture, stock breeding, dairy work), domestic studies (cooking, cutting and dressmaking) and a general practical education (spelling, practical arithmetic).

Dairy schools (mixed) train students for managerial posts in agricultural dairy undertakings of a co-operative or industrial type. At present there are five of these schools. Courses vary from 1 to 3 years according to need. *A school of sheep breeding* and a *school of poultry-farming* are at present being conducted under the same conditions.

Teacher training schools

The primary teacher training schools (*écoles normales primaires*) train men and women primary school teachers. These schools which were established by the Act of 1833, as amended by the Act of 9 August 1879, are subordinated to the *départements;* in theory each *département* must have one such school for men and one for women. The schools were abolished during World War II, but have nearly all been reopened since the Liberation; in practice, some of them are now shared between *départements* and some are mixed schools.

Pupil-teachers are recruited by competitive examinations held at two levels. The more usual is the *concours normal* which is open to candidates of French nationality who are between the ages of 15 and 17 years on the first day of January preceding the examination and hold a BEPC (lower secondary school certificate). The other examination is reserved for candidates who hold the complete *baccalauréat* diploma (*bacheliers complets*, i.e., who have passed both parts of the *baccalauréat*) and are between 17 and 19 years of age on the same date. Exemptions in respect of the upper or lower age limit may be granted by the regional directors of education (*Recteurs*).

Students who enter at the lower level take a 4-year course. They begin by preparing for the *baccalauréat*, in 2 or 3 years, according to whether they entered direct into the first class (if they have already finished the second class) or whether they enter the second class. They are then required to undergo 1 or 2 years' professional training, as the case may be. The *normaliens* (students at an *école normale*) who already hold the *baccalauréat* do 2 years of professional training. The preparatory classes for the *baccalauréat* apply substantially the same syllabuses and time-tables as those for the long modern course and for the experimental science courses at *lycées* and *collèges*.

In the classes actually concerned with professional training, the syllabus has two essential parts: instruction in the theory of education, and child psychology which is given at the teacher training school itself, and teaching practice, which includes practical exercises and practice courses in class teaching and giving actual lessons.

The course leads to a teacher training certificate (*certificat de fin d'études normales*) which exempts holders from taking the written and oral examinations for the certificate of teaching proficiency (*certificat d'aptitude pédagogique*). The pupil-teachers take the practical tests for this certificate during the first term of the school year after they leave the teacher training school, and become qualified on 1 January in the following year.

Pupil-teachers who are particularly gifted in certain disciplines may be transferred to a training school in the head town of an educational region (*académie*) where special mixed courses in philosophy or mathematics have been established. These students enjoy a priority over their fellow students with respect to grants for the continuation of their studies for the purpose of preparing for the competitive entrance examination for the higher teacher training schools (*écoles normales supérieures*) at Saint-Cloud or Fontenay or the higher teacher training schools for technical education or physical education or for training as teachers of art or music.

Those who do not succeed in obtaining a grant or do not apply for one, may be assigned to the special sections for the training of teachers in the *cours complémentaires*.

Teaching staff. Principals are chosen from a list of candidates of special ability, who have performed the duties of a primary school inspector and of a teacher at an *école normale*, *lycée* or *collège*.

Teachers for the professional training classes are recruited from primary school inspectors who hold the teaching licentiate (*licenciés d'enseignement*). Teachers of special subjects may be recruited from candidates who hold an *agrégation* or a CAPES, or from secondary teachers of art and music, under the same conditions as teachers at a *lycée* or *collège*, or from candidates who hold the diplomas required from all teaching staff.

The following table shows the distribution of the weekly working hours among the subjects covered by the professional training curriculum.

Special schools

Classes have been organized in establishments of various kinds, which by their material, medical and pedagogical equipment are able to meet the special needs of various categories of children.

The less infirm children, who are the most numerous, are advised to attend open-air classes or schools—including schools for full-time or part-time boarders where they can be assured of living under specially favourable hygienic conditions and medical supervision.

More seriously ill children receive their schooling in classes attached to various types of establishment for the prevention, treatment or cure of disease, which come under the Ministry of Public Health: homes of a hospital type, open air sanatoria, preventoria, ordinary sanatoria, hospitals, centres for paralysed children and for functional re-education. The medical officer decides how much schooling shall be given and how much time each sick child shall spend on school work.

The *lycées climatiques* are public secondary schools, which take the local children as day scholars and children of delicate health from all parts of metropolitan France and Overseas France as boarders. At present there are *lycées climatiques* at Briançon, Arcachon, Argelès-Gazost, Embrun and Gérardmer; these schools can take a total of 1,860 pupils of both sexes. The *lycée climatique* is first and foremost a school. It does not take sick children and can in no sense be regarded as a medical establishment.

d'Enseignement par Correspondance). In 1939–40, when many children had been separated from their families because of the war, tuition by correspondence was established for them and this new institution was placed in the *Musée Pédagogique*. Although its establishment was due to temporary conditions, correspondence courses in reality fulfilled a permanent need. Children and young persons who find themselves isolated from a school or are unable to attend one regularly are in fact as numerous in peace time as in time of war.

This is true in particular of disabled or sick children and young persons who cannot attend school either because they are receiving treatment at a curative institution or simply because the care which their state of health demands prevents them from leaving their families; children whose domicile is a long way from any French school, particularly the children of families resident abroad or in French territories overseas (the education of these children is particularly important in terms of producing overseas citizens with a French education, capable of filling responsible positions); young persons who are backward in their studies, wish to resume them, but cannot be admitted to a class of children or very young pupils; young persons who are obliged to earn their living on account of the lack of family resources—orphans, elder children of large families and so forth; lastly, a particularly numerous and important category, young persons who are already at work and wish to complete their general and technical training and prepare for examinations qualifying them to take up an occupation.

The principle of equality in education which is one of the fundamental rules of French democracy, requires that educational opportunities be provided for students in all these categories.

The National Correspondence School actually comprises four different establishments: classical secondary, modern secondary, technical secondary and primary. The first two provide instruction from the sixth class to the *baccalauréat*, for all the sections, and include further preparatory classes for the state higher professional colleges (*grandes écoles*). The third or technical correspondence school prepares students for a wide variety of examinations, including competitive examinations, ranging from proficiency certificates for shorthand-typists, assistant accountants, draftsmen and so forth, up to the competitive examination for qualification as an assistant teacher via the certificate for commercial studies (*brevet d'enseignement commercial*), the social studies certificate (*brevet d'enseignement social*) (parts 1 and 2), the secretariat certificate, and the preliminary and final examinations for accountancy certificates.

The National Correspondence School also coaches students for the qualifying examination for secondary teachers and for the proficiency certificate for teachers at vocational secondary schools (*collèges techniques* and *écoles nationales professionnelles*).

The centre now has more than 35,000 pupils. In the next few years it will be called upon to play an important part in social progress; with the help of radio and television, secondary education will be available through correspondence lessons to anyone who has been deprived of it because of ill-health, social position or inability to reach a school.

Out-of-class activities

The pupils' free time is spent on excursions to museums and the national parks.

In order to develop the personality of the pupil and make class instruction more alive, out-of-class and after-school activities have been established, particularly in the form of dramatic performances by the pupils. The organization Théâtre et Enseignement (Theatre and Education) receives funds from the national education budget. In addition, schoolchildren can obtain tickets at reduced prices, or even free, for performances of the great French and foreign classics.

The participation of secondary school students in sports events is facilitated by the school and university sports office (Office du Sport Scolaire et Universitaire—OSSU) founded in 1934. The functions of this organization are: to ensure that the rules governing sports associations and their management are in conformity with the law; to supervise admission to membership of university clubs; to encourage participation in sports contests open to students or schoolchildren; to organize regional, interregional and national sports competitions; to promote international relations in sport.

Pupils at French secondary schools take part in international correspondence between schools and exchange

visits with schoolchildren in a great many foreign countries.

Many French schools are 'associated' with schools abroad and exchange pupils with these schools.

TRENDS AND PROBLEMS

The growth of technology and science, and the changes which are taking place in the conditions of life, make it imperative that educational systems should be concerned with training the men of tomorrow. This is the aim which has guided recent educational reforms in France, where the authorities are trying to adapt the educational system to the realities of the modern world without turning away from the past and the humanist tradition.

The reform of 6 January 1959 was part of the plan to achieve this purpose. Educational guidance is taking its place securely alongside the actual teaching work. The guidance councils enable teachers to observe the children more thoroughly and find out which type of education is best suited to each child's character and abilities. They also allow more detailed and continuous parent-teacher co-operation.

An indispensable corollary to the regular and systematic educational guidance of children is the abolition of vertical partitions between different types of secondary education. It is essential in order to be able to give guidance to the children that the general and technical courses, both the long and the short courses, should be established in such a manner as to permit the passage of the child from one course to another. Consequently, the authorities in charge of primary, secondary and technical education must henceforward work in close liaison with one another in all relevant administrative matters.

The evolution of education must adapt itself to the social and scientific evolution. A modern country needs trained persons who can fill responsible posts, both of a general and of a specialized nature, and it needs technicians. All citizens must be in a position to receive the education which it is the state's duty to provide. This education must give every person the training he needs for the full exercise of his rights and duties as a citizen. The reforms already made and those that are in progress are intended to establish an intermediate level of education which will meet this double requirement.

STATISTICS

Population (mid-year 1958 estimate): 44,558,000.
Area: 212,822 square miles; 551,208 square kilometres.
Population density: 209 per square mile; 81 per square kilometre.

Summary of school statistics, 1953–57. In 1957/58, the total pupil enrolment of 9 million represented about one-fifth of the total population. This enrolment was distributed as follows: 15 per cent in pre-primary education, 62 per cent in primary education, 14 per cent in general secondary education, 6 per cent in vocational education, 0.3 per cent in teacher training, 2 per cent in higher education, about 0.6 per cent in special education. The proportion of girls was 49 per cent in primary schools, 52 per cent in secondary schools, 41 per cent in vocational schools, 52 per cent in teacher training schools, and 38 per cent in the public university faculties. The average number of pupils per teacher was 26 in public primary schools (including nursery schools, infant classes and *cours complémentaires*). Between 1953 and 1957, primary school enrolment increased by 21 per cent, and secondary school enrolment by 39 per cent. (See Table 2.)

Enrolment trends in secondary education, 1930–57. The most remarkable aspect of enrolment trends in public secondary education during this period was the rapid growth of enrolment in vocational schools, which multiplied 9 times between 1930 and 1957. During these 28 years, general secondary school enrolment more than tripled, while teacher training enrolment increased by only 43 per cent. Whereas boys were slightly more numerous than girls in general secondary schools at the beginning of the period, the situation was reversed at the end of the period. The average total enrolment in all types of public secondary education was nearly three times as high for the period 1955–57 as for 1930–34. The average total enrolment in public schools for the period 1955–57 represented 42 per cent of the estimated population 15–19 years old. (See Table 3.)

Examination results in secondary education, 1953–57. Table 4 shows an increase of 30 per cent in the number of those passing the *baccalauréat* examination between 1953 and 1957. In 1957/58, there were 46 per cent girls among these new bachelors. The number of vocational proficiency certificates (*CAP*) increased by 18 per cent, while that of certificates of vocational studies, lower stage (*brevets professionnels*) and the *brevets d'enseignement* increased by 49 per cent.

Educational finance, 1957. For the fiscal year beginning in January 1957, total expenditure of the Ministry of Education amounted to 453,499 million francs, averaging about 10,300 francs per inhabitant. Included in this total was an amount of 23,765 million francs for cultural activities, libraries, etc., and another 8,229 million francs for the National Centre for Scientific Research (CNRS). Capital expenditure accounted for 23 per cent of the total expenditure. (See Table 1.)

FRANCE

Algeria and the overseas *départements*

In Algeria and the French overseas *départements*, all population groups attend the same schools in an atmosphere of complete equality. School attendance is compulsory and free of charge for all children between 6 and 14 years of age. Education is organized along the same lines as in metropolitan France, and the basic legislative provisions are applied; however, necessary adjustments have been made at the various levels of education. The language of instruction is French.

In the overseas *départements*, there are almost as many girls in school as boys, and the rate of school attendance is fairly normal. The percentage of adult illiterates remains rather high, owing to the rapid growth of population as a result of which there are still not enough schools. However, school building is being prosecuted with special energy and is gradually approaching the point at which the most urgent needs will be met.

[*Text prepared by the French National Commission for Unesco, in March 1960.*]

ALGERIA

THE EDUCATIONAL SYSTEM

For the purposes of educational administration, Algeria forms an *académie*, headed by a *Recteur*. All public schools come under the authority of the Directorate-General of Education, a service controlled by the *Recteur*, who is responsible to the Ministry of National Education. However, Article 47 of the Law of 20 September 1947, defining the constitutional status of Algeria, specifies that the *Recteur* is answerable to the Governor-General for all matters concerning the plan for the extension of schooling to all Muslims in Algeria. The Algerian central authorities are

responsible for the financing of education, but regulations, curricula and the appointment of teachers are matters for the Ministry of National Education.

The *Recteur* is assisted by two deputies, an inspector of vocational education, a woman inspector of vocational and art education, and an inspector of agricultural education. At the head of each of the *départements* is a secondary school inspector with a number of primary inspectors under him.

TYPES OF SECONDARY EDUCATION

General secondary schools

The Order of 20 August 1958 stipulated that there was to be an increase of 4,000 in the total school enrolment each year. In compliance with this order, a large *lycée* for girls has just been opened at Kouba (Algiers), as well as a *lycée* at Tlemcen and a *collège* at Orléansville. Secondary education is also provided in *cours complémentaires* (primary complementary courses), which enrol an additional 3,700 pupils and which are expected to have an enrolment of 35,000 in 1966, and in a number of private secondary schools.

About 12 years ago, a provision was reintroduced whereby candidates for the *baccalauréat* in Algeria do not need to sit for a foreign language, as literary Arabic can count as the first language and a dialect of Arabic as the second language. The aim is to afford some compensation for the handicap which most young Muslims have to face owing to the fact that French is not their mother tongue, and also to encourage young Europeans to learn Arabic. The secondary schools have approximately 120 teachers who teach literary Arabic or a dialect of Arabic to about 10,000 pupils, most of them Muslims.

Franco-Muslim lycées. A great effort has been made to adapt secondary education to local conditions in Algeria, whose traditional culture and civilization are clearly an asset which could not be neglected. However, it was necessary that any such development should fit in with the metropolitan type of secondary schooling, which represented a 'modern' factor in education.

Thus, the ministerial Decree of 10 July 1951 established, alongside the metropolitan type of *lycée*, special schools for French Muslims in place of the *medersas* of Algiers, Constantine and Tlemcen. A commission for Franco-Muslim *lycées* was set up in Algiers to advise on problems concerning curricula in these schools.

In addition to providing the traditional instruction of the *medersas*, these schools prepare pupils for the secondary *baccalauréat* examinations. The course lasts 7 years, and pupils may choose between three different sections—classical (type B of the metropolitan French system) and modern, and a traditional section without Latin, where the same scientific subjects are taught as in the classical section, and a high standard is reached in Arabic and Islamic studies.

On reaching the sixth-year class (*classe de première*) the pupils from these three sections may sit for the first part of the corresponding type of *baccalauréat* (classical B, or modern) or of the *diplôme de fin d'études des lycées d'enseignement franco-musulman* (Franco-Muslim secondary leaving certificate). In the terminal classes, they prepare either for the second part of the *baccalauréat* (philosophy or elementary mathematics or experimental science) or for the second part of the Franco-Muslim certificate or for both.

The course of Arabic and Islamic studies, given in Arabic, involves a very advanced study of Muslim law in both the traditional and classical sections; it provides the training required by those seeking careers in the Muslim magistrature and by the *mouderres* who teach Arabic in the primary schools. The law courses are less advanced in the modern section, but cover the general principles governing Muslim family life. The examination for each part of the Franco-Muslim secondary leaving certificate includes eliminatory written tests followed by oral tests. The subjects for the written tests, which are the same for the two Franco-Muslim *lycées*, are selected by the *Recteur* of the Algiers *académie*.

The Franco-Muslim *lycées* have a total of 1,000 pupils, all native-born Algerians, and most of them boarders holding scholarships. To encourage still further the interpenetration of culture, a new experiment has been tried out. The two Franco-Muslim *lycées*, one for girls and the other for boys, have been linked up with the boys' *lycée* at Ben Aknoun and the girls' *lycée* at Kouba respectively, and now form special sections of these schools.

Vocational and technical schools

A great effort is also being made for the training of technicians. The plan for the extension of schooling provides for an enrolment of 42,000 pupils by 1966.

Secondary technical education is provided in the technical (industrial and commercial) *collèges* of Algiers, Constantine and Bône, and in the technical streams of *lycées* and *collèges*. There is a technical (industrial and commercial) stream at the *collège* in Oran, a stream preparing pupils for the technical *baccalauréat* and the preliminary examination for surveyors at the Maison-Carrée *lycée*, and combined economics and commercial streams at the *lycées* and *collèges* of Algiers, Oran, Sidi-bel-Abbès, Tlemcen, Mascara and Philippeville.

The main special subjects taught in the industrial streams are: fitting and machine-tools, iron-working, locksmithing, boiler-making, welding, carpentry and joinery, cabinet making, pattern making, electricity, auto mechanics and—according to the needs and possibilities of the schools—leatherwork, decorative painting and house painting, foundry work, building and public works and refrigeration. The industrial school at Dellys, which acquired the status of a national vocational school (*école nationale professionnelle*) under the Decree of 9 December 1950, concentrates mainly on the training of technicians for precision engineering, electricity and refrigeration, public works and building. Together with the industrial streams at Algiers, Maison-Carrée, Oran and Bône, it prepares pupils for the technical *baccalauréat*. Algiers and Oran also prepare pupils for the national schools of civil engineering.

Private associations, chambers of commerce and municipalities have instituted, with the help of the technical

education authorities, training courses in such fields as commerce, banking, and dressmaking.

Teacher training schools

There are not enough teacher training schools. Several of those in existence include a section providing special training for primary teachers from France in such subjects as Arabic, Kabyle, agricultural work, etc.

Under the plan for the extension of schooling, a special corps of teachers, who need no further qualifications than a lower secondary certificate—the *brevet élémentaire* (BE) or the *brevet d'études du premier cycle* (BEPC)—was established to make up for the shortage of primary school teachers. Special training facilities were provided for candidates to help them prepare for the *baccalauréat* which enables them to become fully qualified teachers.

STATISTICS

Population (mid-year 1958 estimate): 10,265,000.
Area: 919,593 square miles; 2,381,741 square kilometres.
Population density: 11 per square mile; 4 per square kilometre.

Summary of school statistics, 1953–57. In 1957/58, school enrolment at all levels (not including adult education courses) reached a total of 573,500 pupils, being about 6 per cent of the population. Of these pupils, 8 per cent were in kindergartens, 76 per cent in primary schools, 11 per cent in general secondary education, 4 per cent in vocational education, and about 1 per cent in higher education. The proportion of girls was 37 per cent in primary schools, 45 per cent in general secondary schools, and 30 per cent in institutions of higher education. In public schools, the pupil teacher ratio was 37 in primary schools, 22 in general secondary schools and 14 in vocational schools. Between 1953 and 1957, enrolment increased by 10 per cent in kindergartens and primary schools and by 19 per cent in secondary education of all types. (See Table 2.)

Enrolment trends in secondary education, 1950–57. Between 1950 and 1957, total secondary enrolment increased by 62 per cent. The increase in vocational school enrolment was slightly more than in general secondary schools. The proportion of girls in general secondary school changed very little over this period, but showed some increase in teacher training. The average total enrolment for the period 1955–57 represented about 9 per cent of the estimated population 15–19 years old. (See Table 1.)

Examination results in secondary education, 1953–57. The number of lower stage secondary school certificates increased by 27 per cent between 1953 and 1957. Girls received about an equal number of certificates as boys. The number of pupils who passed the *baccalauréat*, first and second parts, increased by 23 per cent and 17 per cent respectively. In vocational education, the increase between 1954 and 1957 was 42 per cent for the *brevets* of industrial and commercial schools and 14 per cent for the vocational proficiency certificates (CAP). The annual number of teacher training certificates fluctuated between 200 and 300, with girls receiving slightly more than half of the total. (See Table 3.)

Educational finance, 1957. In the fiscal year beginning in April 1957, total expenditure for education (not including funds from the separate budgets of the Algerian *départements* nor from the local authorities) amounted to 30,170 million French francs, averaging about 3,000 francs per inhabitant. About 75 per cent was for recurring expenditure. (See Table 4.) The distribution of recurring expenditure by level and type of education is shown in Table 4C.

4. Includes tuition fees amounting to 13,439,000 francs.
5. Includes *cours complémentaires*.

FRENCH GUIANA

THE EDUCATIONAL SYSTEM

Prior to 1 January 1948, when it became a French *département*, Guiana came under the Colonial Ministry, and legislation on education had to be made applicable in the Colony by special decree.

For many years, education was provided by the Church, with the schools under the management of religious congregations. The public schools were secularized in 1884. With the introduction of the education laws of the Republic, public education was taken out of the hands of the religious bodies and entrusted to laymen, religious instruction becoming a purely denominational matter. The staff, who were appointed by the Governor on the recommendation of the head of the Public Education Service, were in three categories: staff on the home establishment seconded for duty in Guiana, usually for a period of two years; staff on the overseas establishment, authorized to teach only in the colonies; and personnel on contract, recruited solely for service in the Colony.

The curricula of public schools were as in metropolitan France, but adapted for local use (more particularly the lessons in history, geography and science).

In 1906, two decrees were promulgated, one on the reorganization of primary education and the other on the colonial *collège*. The Collège de Cayenne—now the Lycée Felix Eboué—consisted of a secondary education division, equivalent to the first cycle of secondary education in France, whence pupils could get scholarships to continue their studies in France; a senior primary division corresponding to the general education sections of French senior primary schools (*écoles primaires supérieures*); and an industrial education division corresponding to the trade schools in France. The Governor was empowered to add to the *collège* a division of primary education and post-school courses dealing more particularly with political economy, economic geography, applied science with special reference to local industries, and agriculture.

With effect from 1 January 1948, the laws and regulations in force in France are applicable to Guiana. The legislation applied in the *département* does not differ in any appreciable degree from that of the mother country. Provision is, however, made for certain adjustments in view of Guiana's remote situation.

For educational administration, the *département* is part of the Bordeaux *académie*. The *Recteur* of the latter is represented locally by the *Inspecteur d'Académie* and is also responsible for the running of the primary school system and for sports and youth services. Owing to the shortage of supervisory staff, he also carries out some of the duties of an inspector of schools.

Supervision and inspection. In principle, school supervision is exercised by travelling inspectors-general, the deputy-rector and a primary school inspector. The deputy-rector's powers include the supervision, at departmental level, of physical and moral conditions and of the finances in educational establishments. The inspecting authorities of the *académie* retain their powers as regards the creation of new public schools, the opening of new private schools and the public financing of education.

Private schools are subject to the same supervision as those in metropolitan France: thus, the *Inspecteur d'Académie* refrains from expressing any opinion on the educational methods employed, and merely satisfies himself that the teaching provided does not contravene the law.

The *académie* services are likewise required to satisfy themselves as to the sanitary conditions of the school buildings and the efficiency of the school health services.

Finance. The expenses of education in Guiana are covered by the French metropolitan budget, but the appropriations made available to the *Préfecture* by the Ministry for allocation to public education fall short of the amount needed. The *communes* are responsible for the upkeep of school premises, but are quite unable to fulfil this requirement satisfactorily, though there is no slackening of effort in Cayenne and Saint-Laurent, the principal centres of activity.

TYPES OF SECONDARY EDUCATION

General secondary schools. General education is provided by the co-educational Lycée Félix Eboué at Cayenne, where the enrolment has trebled since 1947, and by a private school whose enrolment has more than doubled in the same period. The regulations for the admission of pupils are the same as for the *lycées* in Martinique.

There is one private and two public *cours complémentaires*.

Vocational and technical schools. At Cayenne a *centre d'apprentissage* (vocational training school) for boys teaches several specialized subjects, such as woodwork, iron-working and electricity. The course lasts 3 years, after which the pupils sit for a local examination. The level of studies is gradually being raised so as to bring it up to the standard required for the *certificat d'aptitude professionnelle* (vocational proficiency certificate).

The only technical education for girls is provided by two domestic science centres, operated by nuns.

STATISTICS

Population (mid-year 1958 estimate): 30,000.
Area: 35,135 square miles; 91,000 square kilometres.
Population density: 0.9 per square mile; 0.3 per square kilometre.

Summary of school statistics, 1953–57. The total enrolment reported for 1957/58 was less than 6,000, showing a decline from the 1953 and 1954 levels. The proportion of girls was 48 per cent in the primary schools and 44 per cent in the public secondary school. There were no girls enrolled in the technical vocational school up to 1956/57. (See Table.)

Examination results in secondary education, 1956, 1958. Information available for 1958/59 shows 28 pupils (16 girls) as having passed the first part of the *baccalauréat*, and 12 (5 girls) the second part. At the end of the school year 1956/57, 59 pupils (28 girls) obtained a lower secondary certificate and 12 (10 girls) a teacher training certificate.

Educational finance, 1956. The budget for education in 1956 amounted to 236,425,000 French francs, an average of 8,000 francs per inhabitant. Capital expenditure was 21 per cent of the total. Official exchange rate (1956): 100 French francs = 0.29 U.S. dollar (approx.).

FRENCH WEST INDIES

Guadeloupe, Martinique

Both islands having been French since 1635, the French culture of Martinique and Guadeloupe is therefore already long established. Before the Revolution, the only teaching provided for the indigenous population was religious (prayers and catechism), given verbally by the priests.

As Martinique and Guadeloupe formed a single colony in those days, both benefited by a law signed by King Louis-Phillippe on 10 August 1839, 'for the moral betterment of the Negroes' and an Order dated 5 January 1840 requiring the clergy 'to lend their services to slave owners for the instruction of the slaves in the Christian religion, ... to arrange for the education of slave children', and prescribing that 'slaves of either sex of 4 years of age or over shall be admitted to all free schools which may be set up in towns, townships and *communes*'.

It was with the abolition of slavery in 1848 that culture began to spread, though somewhat on 'hit-and-miss' lines and quite unplanned. Schoelcher was the great champion of the compulsory secular school.

In pursuance of the Law of 19 March 1946, which gave the former French colonies in the Americas the status of *départements*, the French educational laws and regulations became applicable in their entirety to Martinique and Guadeloupe. Nevertheless, long before 1946, the basic laws on education in metropolitan France were already in force in what are now the overseas *départements* (Laws of 1881, 1882 and 1889, as amended by the Law of 1936, making education free of charge, secular and compulsory between the ages of 6 and 14). After 1 January 1948, both islands' educational services became inspectorates under an *académie*, and the staffs of public educational establishments were enrolled in the metropolitan establishment of teachers.

Thus, the Government has pursued the objective of complete assimilation to the metropolitan system, while allowing for the special aspirations and needs of the inhabitants of the new *départements* and also for the inevitable difficulties caused by their remoteness from the home country.

The constitutional basis and general aims are the same in Martinique and Guadeloupe as for metropolitan France, and are laid down in the Constitution of the French Republic of 4 October 1958, the Preamble to which states: 'The nation guarantees equal access for children and adults to schooling, professional training and culture. The organization of free secular public education at all levels is a duty of the State'.

In the overseas *départements*, staff salary charges are borne by the State. Expenditure for school buildings, the furnishing of classrooms and teaching material is, in theory, distributed between the State and the *communes*. In actual fact, the bulk of this expenditure is borne by the State, as the *communes*, which often have but scant resources, can defray only a small fraction of this expenditure. State subsidies are also provided for school buildings.

GUADELOUPE

The island of Guadeloupe, first occupied by the French in 1635, has been permanently attached to France since 1815. It has many islands and groups of islands as its dependencies, including the Saintes Group, Marie-Galante, La Désirade, Saint-Barthélemy and Petite Terre.

For educational administration the *département* of Guadeloupe is attached to the *académie* of Bordeaux.

The head of the education service in the island is a university *agrégé* stationed at Pointe-à-Pitre, who is assisted by two primary school inspectors.

TYPES OF SECONDARY EDUCATION

General secondary schools. There are two co-educational *lycées* at Guadeloupe. The first, at Pointe-à-Pitre, comprises a division for boys, the Groupe Carnot, and one for girls, the Groupe Michelet. School enrolment has been steadily increasing, particularly in the case of girls, whose numbers have doubled since 1947. The second is the Lycée Gerville-Réache at Basse-Terre. Its enrolment has almost doubled since 1947.

The admission of pupils and the recruitment of teachers follow the same rules as in the *lycées* of Martinique.

There are also three private secondary schools at Guadeloupe, one at Pointe-à-Pitre, one at Basse-Terre and the *collège* at Blanchet.

Between 1957 and 1959 the number of public primary complementary courses (*cours complémentaires*) rose from 20 to 34 and the pupil enrolment from 2,489 to 4,101. Guadeloupe also has private *cours complémentaires*.

Vocational and technical schools. There is a co-educational *collège technique* at Pointe-à-Pitre. The special subjects taught in the industrial section are fitting, carpentry and joinery, and lathe-work, and, in the commercial section, book-keeping, typing and shorthand.

A co-educational apprenticeship centre is attached to the *collège technique*, where commerce, book-keeping, drawing, iron-working and carpentry are taught.

A technical section attached to the Pointe-à-Pitre *lycée* is for girls only. It teaches cutting, sewing, embroidery, hat making, etc. A technical section is also attached to the Lycée Gerville-Réache.

STATISTICS

Population (mid-year 1958 estimate): 259,000.
Area: 687 square miles; 1,780 square kilometres.
Population density: 377 per square mile; 146 per square kilometre.

Summary of school statistics, 1953–57. In 1957/58, total enrolment was 54,027, representing 22 per cent of the total population. Of these pupils, nearly 4 per cent were in pre-primary schools, 89 per cent in primary schools, 6 per cent in general secondary schools, and the rest in vocational and teacher training schools. The proportion of girls was 50 per cent in primary schools and 68 per cent in general secondary schools. The teaching staff (not including private primary schools which enrolled 8.5 per cent of all pupils) consisted of 1,144 members, of whom 69 per cent were women. In the public primary schools there were approximately 45 pupils per teacher. Between 1953 and 1957, total enrolment increased by 17 per cent. (See Table 2.)

Enrolment trends in secondary education, 1931–57. Enrolment in general secondary schools increased 7 times between 1931 and 1957. Vocational education, which hardly existed at the beginning of this period, enrolled more than 500 pupils towards the end. In recent years girls have outnumbered boys in all three types of secondary education. The secondary enrolment ratio rose steadily from about 2 in the 1931–34 period to about 17 for the period 1955–57. (See Table 3.)

Examination results in secondary education, 1956, 1958. Information available for 1958/59 shows 186 pupils (90 girls) as having passed the first part of the *baccalauréat*, and 98 (52 girls) the second part. At the end of the school year 1956/57, 443 pupils (240 girls) obtained a lower secondary certificate (*brevet*) and 43 pupils (28 girls) a teacher training certificate.

Educational finance, 1957. Total expenditure for education in 1957 amounted to 1,430 million French francs, an average of 5,700 francs per inhabitant. Capital expenditure was about 8 per cent of the total. (See Table 1.)

MARTINIQUE

TYPES OF SECONDARY EDUCATION

General secondary schools. There are two *lycées* at Fort-de-France, one for boys and one for girls. The Lycée Schoelcher (for boys) also has primary classes. The qualifications for admission to the first-year class (*classe de sixième*) are the completion of 5 years' primary schooling and success in the entrance examination. The best pupils from the primary complementary courses (*cours complémentaires*), which offer 4 years' schooling after the 5-year primary course proper, are admitted to the fifth-year class (*classe de deuxième*) of the *lycées* on conditions laid down by ministerial instructions of 3 June 1949. Candidates passing the competitive examination for student teachers may also enrol in the upper stage of the *lycée*. The Lycée Schoelcher accepts full boarders (paying fees), day boarders or ordinary day pupils. The buildings are relatively recent and modern. Since 1948 the *lycée* has, in accordance with a ministerial decree, been classified as a state-maintained building for civil use. The girls' *lycée* accepts only day pupils. A technical stream has also been added to the school.

Teaching staff is recruited from among candidates holding the *agrégation*, or a teacher's certificate, or a *licence*, or they may be *délégués ministériels d'enseignement* (temporary staff appointed by the Minister of Education), i.e. assistant teachers and assistant teachers not holding any degree. Posts not filled by the Minister may be occupied by auxiliary staff appointed by the Deputy-Rector. Staff from metropolitan France is appointed to the *département* for a period of two years.

Private education is provided in three schools, two at Fort-de-France and one at Morne Rouge.

Apart from the *lycées* and *collèges*, there are now 26 public *cours complémentaires*, as against 19 in 1957, and 2 private schools.

Vocational and technical schools. A co-educational vocational training school (*centre d'apprentissage*) has been set up at Fort-de-France. A co-educational *collège technique* with several streams (industrial, commercial and applied arts) has also been established at Fort-de-France; admission is on a competitive basis.

Boys may study the following special subjects: fitting, lathe-work, carpentry and joinery, cabinet-making, auto mechanics, electricity, machine-tool work and boiler-making. The course of study is extended to 4 years for topographers, electricians and specialists in internal combustion engines.

Pupils are prepared for the *certificat d'aptitude professionnelle* (vocational proficiency certificate), the *brevet d'enseignement technique* (technical certificate) and the *brevet d'enseignement commercial* (commercial certificate). The best pupils are sent to France and generally enter the third year of a national vocational school (*école professionnelle nationale*). Girls in technical schools are taught dressmaking, sewing and embroidery, cooking, and welfare work.

Enrolment in technical schools has slightly increased since 1957.

STATISTICS

Population (mid-year 1958 estimate): 265,000.
Area: 425 square miles; 1,102 square kilometres.
Population density: 624 per square mile; 240 per square kilometre.

Summary of school statistics, 1953–57. For 1957/58, total school enrolment may be estimated at 71,000 pupils, or 28 per cent of the population. Of these pupils, 9 per cent were in nursery schools and 85 per cent in primary schools. The proportion of girls was 51 per cent in the primary schools and 46 per cent in public secondary schools. Between 1953 and 1957, enrolment increased by 37 per cent in primary schools and by 38 per cent in public secondary schools, including vocational and teacher training schools. (See Table 1.)

Enrolment trends in secondary education, 1936–56. Enrolment in public secondary schools increased by 73 per cent between 1936 and 1956; in vocational schools there was a doubling of enrolment between 1938 and 1956, though it had reached a higher level in the years up to 1952. The average total enrolment of public secondary school pupils (general and vocational) in 1956 and 1957 represented about 13 per cent of the estimated population 15–19 years old. (See Table 2.)

Examination results in secondary education, 1956, 1959. Information available for 1958/59 shows 233 pupils (119 girls) as having passed the first part of the *baccalauréat* and 150 pupils (85 girls) the second part. At the end of the school year 1956/57, 516 pupils (355 girls) obtained a lower secondary certificate (*brevet élémentaire* or *brevet d'études du premier cycle*), and 131 pupils (102 girls) a teacher training certificate.

Educational finance, 1956. In 1956 the general budget for national education amounted to 1,819 million French francs, averaging over 7,000 francs per inhabitant. Official exchange rate: 100 French francs (1956) = 0.29 U.S. dollar (approx.).

RÉUNION

THE EDUCATIONAL SYSTEM

Decree No. 47–1286 of 27 June 1947 made the laws and regulations of metropolitan France on education at all levels applicable in full to the *département* of Réunion. This decree was the corollary, in the educational sphere, of the Law of 19 March 1946 making Réunion a French *département*. The Laws of 1881, 1882 and 1889, amended by the Law of 1936, making primary education free of charge, secular and compulsory, were, however, already in force in Réunion.

The constitutional bases and aims of education are the same as for metropolitan France. The Article in the Preamble of the French Constitution of 4 October 1958 which guarantees the right of all French citizens to education, vocational training and culture by the provision of secular, free and compulsory education, applies to Réunion on the same footing as to the *départements* in the mother country. Some children, however, especially those living in the mountains inland, or scattered among the isles, fail to attend school; the distances to be covered, often over dangerous paths, preclude attendance.

For purposes of educational administration the *département* of Réunion comes under the *Recteur* of the *académie* of Aix-en-Provence, who is represented by his deputy; who is also the *Inspecteur d'Académie* and is in charge of all departmental services under the Ministry of National Education. He is assisted by three primary school inspectors. Over and above their educational functions, the latter have wide administrative responsibilities—the establishment and building of new public schools, opening of new private schools and supervision of school attendance. They also advise on the appointment and promotion of men and women teachers in the public education service.

There is a good health service.

The staff costs of public education are met by the State. The costs of building, maintaining and fitting out school premises are in theory at any rate, shared between the State and the *communes*. The funds made available to the *département* by the mother country, being greatly in excess of those which were at the former Colony's disposal, have allowed of a substantial increase in the number of classes and staff within the space of a few years.

The private schools receive subsidies from the State in the form of capitation grants proportionate to the numbers of their pupils.

TYPES OF SECONDARY EDUCATION

General secondary schools. There are two *lycées* at St. Denis, one for boys (the Lycée Leconte de Lisle) and the other for girls (Lycée Juliette Dodu). Between 1947 and 1959 the enrolment in the boys' *lycée* rose from 648 to 937, and in the girls' *lycée* from 283 to 613.

St. Denis also has two private secondary schools (a seminary and a girls' boarding school). There are also 36 public and 6 private *cours complémentaires*.

Vocational and technical schools. There are two *centres d'apprentissage* (vocational training schools), one at St. Louis and the other at St. Denis. Both have up-to-date equipment. The boys may choose between the following special subjects: fitting, lathe-work, milling, electricity, carpentry and joinery, and masonry; the girls may choose between dressmaking and domestic economy.

Teacher training schools. A teacher training section for student teachers is attached to the *lycée*.

STATISTICS

Population (mid-year 1958 estimate): 318,000.
Area: 969 square miles; 2,510 square kilometres.
Population density: 328 per square mile; 127 per square kilometre.

Summary of school statistics, 1953–57. In 1957/58, total enrolment of about 63,000 pupils represented approximately 21 per cent of the population. Primary schools accounted for 91 per cent of these pupils, nursery schools and infant classes 6 per cent, and about 3 per cent were enrolled in secondary schools. There were more girls than boys at every level of education except in vocational schools and in the Institute of Legal Studies. Women made up 75 per cent of the teaching staff in primary schools, where there were an average of 38 pupils per teacher. In secondary schools the pupil teacher ratio was 16. Between 1953 and 1957 enrolment increased by 27 per cent in the primary schools. (See Table 1.)

Enrolment trends in secondary education, 1930–57. Between 1930 and 1957, total enrolment in public secondary schools multiplied more than four times. The proportion of girls steadily increased during this period until it reached 51 per cent of enrolment. Yet, taking into account all types of secondary education, both public and private, the average total enrolment for the period 1955–57 was only 6 per cent of the estimated population 15–19 years old. (See Table 2.)

Examination results in secondary education, 1953–57. At the end of the school year 1957/58, 98 pupils (52 girls) passed the second part of the *baccalauréat*, as compared

with 64 (37 girls) in 1953. In 1956/57 lower secondary certificates (*brevet élémentaire* or *brevet d'études du premier cycle*) were awarded to 581 pupils (365 girls), and teacher training certificates to 145 pupils (108 girls).

Educational finance, 1957. In 1957, total expenditure on education amounted to 2,826 million French francs (about 8,900 francs per inhabitant). Teachers' salaries accounted for 92 per cent of the total and capital expenditure for about 4 per cent. (See Table 3.)

Source. Réunion: Vice-Rectorat, replies to Unesco questionnaires.

FRANCE

French Overseas Territories

French Overseas Territories which, in the referendum of 28 September 1958, accepted the Constitution of the Fifth Republic, were given the opportunity to decide on their future status: they could retain their status as territories, become overseas *départements*, or become Member States of the *Communauté*. The five territories treated in this chapter: Comoro Islands, French Somaliland, French Polynesia, New Caledonia and St.Pierre and Miquelon chose the first of these solutions.

Each is administered by a governor, assisted by a government or executive council and an elected territorial assembly. Each territory is also represented in the National Assembly and the Senate in Paris.

The pattern of education is essentially the same as in metropolitan France, with some adaptation of programmes to local conditions.

COMORO ISLANDS

STATISTICS

Population (mid-year 1958 estimate): 182,000.
Area: 838 square miles; 2,171 square kilometres.
Population density: 217 per square mile; 84 per square kilometre.

Summary of school statistics, 1953–57. In 1957/58 there were 2,907 pupils enrolled, including 300 girls. The teaching staff consisted of 60 teachers, of whom 5 were women. The pupil-teacher ratio in primary schools was 55, as compared with 63 in 1953/54. Total enrolment increased by 10 per cent between 1953 and 1957. The enrolment of girls nearly tripled during these years, but the proportion of girls was still only about one-tenth of the total enrolment in 1957. (See Table 2.)

Enrolment trends in secondary education, 1949–57. There were 30 pupils enrolled in a secondary school in 1949. This number had increased to 100 by 1951, then remained more or less stationary up to 1957. Even including the pupils receiving vocational and teacher training, the total enrolment in secondary education in 1957 was less than 1 per cent of the estimated population 15–19 years old.

Educational finance, 1959. For the fiscal year beginning in January 1959, the amount budgeted for education was 42,569,000 C.F.A. francs, of which 66 per cent was for salaries to teachers, etc. Average expenditure for education was about 2.30 francs per inhabitant. (See Table 1.)

FRENCH POLYNESIA

STATISTICS

Population (mid-year 1958 estimate): 79,000.
Area: 1,544 square miles; 3,998 square kilometres.
Population density: 51 per square mile; 20 per square kilometre.

Summary of school statistics, 1953–57. In 1957/58, total school enrolment reached 16,456 pupils, or 22 per cent of the population. Of these pupils 93 per cent were enrolled in primary schools; in the public primary schools as a whole, the average number of pupils per teacher was 36. Between 1953 and 1957, primary school enrolment increased by 12 per cent and secondary enrolment including vocational schools by 72 per cent. (See Table 1.)

Enrolment trends in secondary education, 1950–57. Total enrolment in secondary education tripled between 1950 and 1957. For the period 1955–57 the average enrolment represented about 15 per cent of the estimated population 15–19 years old. (See Table 2.)

Examination results in secondary education, 1953–56. The number of certificates granted each year from 1953 to 1956 was as follows: lower secondary certificate (*brevet*)—1953/54, 51; 1954/55, 78; 1955/56, 59; 1956/57, 88: vocational proficiency certificate (CAP)—1953/54, 18; 1954/55, 23; 1956/57, 22.

Educational finance, 1958. The educational budget for 1958 amounted to 408 million French francs. In addition, 82.3 million francs were allotted to education from the Investment Fund for Economic and Social Development (FIDES) for the 1958/59 period. Thus the average expenditure per inhabitant was about 6,200 francs. Subsidies to private education amounted to 81 million francs. (See Table 3.)

FRENCH SOMALILAND

STATISTICS

Population (mid-year 1958 estimate): 69,000.
Area: 8,500 square miles; 22,000 square kilometres.
Population density: 8 per square mile; 3 per square kilometre.

Summary of school statistics, 1953–57. In 1957/58, there were 2,518 pupils enrolled in primary schools, complementary courses, and vocational courses; this represents less than 5 per cent of the total population. Girls made up about one-fourth of total enrolment. The pupil teacher ratio in primary schools was 32. The average number of pupils per teacher tended to be higher in private schools than in public schools. Between 1953 and 1957 there was almost 30 per cent increase in primary school enrolment. (See Table 2.)

Enrolment trends in secondary education, 1950–57. In 1950, there were 20 pupils (including 2 girls) receiving general secondary education. This number had increased to 161 (including 47 girls) in 1957. In vocational education, the growth was less marked, since there were 143 pupils (including 70 girls) in 1957 as compared with 107 pupils (including 37 girls) in 1950. The average total enrolment in secondary education for the whole period under review amounted to about 4 per cent of the estimated population 15–19 years old.

Examination results in secondary education, 1953–56. The number of pupils receiving certificates for completing the lower cycle of secondary education, lower stage (*brevet élémentaire* and *brevet d'études du premier cycle*) was as follows: in 1953, 10; 1954, 9; 1955, 8; 1956, 12. There were, in addition, 11 certificates of vocational aptitude awarded in 1956/57.

Educational finance, 1959. The budget for education in the fiscal year beginning in January 1959 amounted to about 80 million Djibouti francs, or 1,156 francs per inhabitant. (See Table 1.)

NEW CALEDONIA

STATISTICS

Population (mid-year 1958 estimate): 69,000.
Area: 7,202 square miles; 18,653 square kilometres.
Population density: 10 per square mile; 4 per square kilometre.

Summary of school statistics, 1953–56. In 1956/57, total school enrolment was made up of 14,850 pupils, nearly one-fourth of the total population. Of these pupils, 88 per cent were enrolled in primary schools, 7 per cent in general secondary education and teacher training, 5 per cent in vocational schools. The proportion of girls was 47 per cent in primary schools, 44 per cent in secondary schools, and 36 per cent in vocational schools. In the public schools, there were on the average 25 pupils per teacher in primary schools, 17 in secondary schools, and 32 in vocational schools. Between 1953 and 1956, primary school enrolment increased by 7 per cent, but secondary (including vocational) enrolment almost doubled. (See Table 2.)

Enrolment trends in secondary education, 1945–56. The number of pupils in general and teacher training secondary schools increased steadily from about 200 in 1945 to over 1,000 in 1956. In vocational schools, the increase was from 68 to 711 over the same period. The average total enrolment was about 400 for the period 1945–49, about 900 for the period 1950–54 and 1,800 for the period 1955–56. Thus, in relation to the estimated population 15–19 years old, the secondary enrolment ratio rose from about 9 for the 1945–49 period to 18 for the next 5-year period, and to 36 for the most recent years.

Examination results in secondary education, 1953–55. The number of certificates granted each year for the years 1953/54, 1954/55, 1955/56, was as follows: lower secondary

1. EDUCATIONAL FINANCE, 1957 (in thousand French francs)[1]

ST. PIERRE AND MIQUELON

STATISTICS

Population (mid-year 1958 estimate): 5,000.
Area: 93 square miles; 240 square kilometres.
Population density: 54 per square mile; 21 per square kilometre.

Summary of school statistics, 1953–57. In 1957/58, a total of 1,325 pupils, about one-fourth of the total population, were enrolled in school. There were more girls than boys enrolled, the proportion of girls being 51 per cent in the primary schools and 57 per cent in the secondary schools and vocational courses combined. There was an increase of 6 per cent in total enrolment between 1953 and 1957. (See Table 2.)

Educational finance, 1958. For the year 1958, the educational budget of the Territorial Government amounted to about 75 million French francs, or approximately 15,000 francs per inhabitant. (See Table 1.)

FRANCE

Members of the *Communauté*

Under the Constitution of the Fifth Republic all French territories were given the opportunity to decide on their future status. Three possibilities were offered to them: that they should retain their status as territories, that they should become overseas *départements*, or that they should become, singly or in groups, self-governing members of an association of states to be known as the *Communauté*. Those which opted for the third solution were granted full internal autonomy; foreign affairs, defence, currency, common economic and financial policy and higher education were among the matters that were placed under the jurisdiction of the *Communauté* as a whole. At the time the manuscript of this third *World Survey of Education* was being prepared (see Preface), the following twelve countries had chosen this status: Central African Republic, Republic of Chad, Republic of the Congo, Republic of Dahomey, Gabon Republic, Republic of the Ivory Coast, Malagasy Republic, Mauritanian Islamic Republic, Republic of the Niger, Republic of Senegal, Republic of Sudan, Republic of the Upper Volta.

CENTRAL AFRICAN REPUBLIC

THE EDUCATIONAL SYSTEM

The secondary schools in the Central African Republic take children who have completed 6 years' primary schooling. The age-limit for admission is fixed at 11–14 for the 'long course' (*enseignement long*), leading after 7 years of study to the *baccalauréat* (university entrance examination), 11–15 for the 'short course' (*enseignement court*), leading after 4 years of study to the *brevet* (lower secondary certificate); and 11–16 for the technical course, which at present lasts 3 years but is to be increased to 4, and which leads to the *certificat d'aptitude professionnelle* (vocational proficiency certificate). A year's grace may be allowed each way; the upper age limits for girls are one year higher.

Pupils taking the long course are normally those who intend to continue at university; the short course is taken by those who will eventually undertake vocational training in order to equip themselves for the intermediate ranks in administration, industry or commerce; while those opting for the technical course will become workers in industry or—where the course is an agricultural one—supervisory workers in agriculture.

Education is centralized under the Ministry of Public Instruction and is given in various types of school: the *collège classique* (or *lycée*) and *collège moderne*, the short-course *collège*, the vocational school (industrial and commercial), and the agricultural school.

The private schools coming under the Catholic missions belong to the first two categories, but the instruction given at them is only up to the level of the *brevet*.

In view of the small number of pupils, there are at present no terminal classes providing instruction for the second part of the *baccalauréat*.

THE DEVELOPMENT OF SECONDARY EDUCATION

Secondary education in the Central African Republic dates back barely 15 years, and it is only since 1953—the date of construction of the Collège Emile Gentil—that the long course can be said to have existed.

The responsibility for organizing education rests with the Ministry of Public Instruction through its Directorate of Education, the school management boards having only an advisory role.

The Agricultural School comes under the Ministry of Agriculture.

The schools are inspected by a locally stationed education officer (*Inspecteur d'Académie*) as well as by inspectors-general sent out on mission by the French Ministry of Education at the request of the Central African Republic.

As the teaching staff, through lack of local teachers, is almost entirely made up of officials provided under the French technical assistance programme, the salaries are paid in the main by the French Government. The funds for building schools also come from this source. On the other hand, current operational costs are defrayed from the

Central African Republic's budget, which also provides for the payment of scholarship grants to practically all the pupils in view of the present low income level of most of the parents. Closer control will in all probability be exercised in the very near future in order to discover which parents are in a position to help maintain their children at school.

The medical and welfare services at schools are still rudimentary.

TYPES OF SECONDARY EDUCATION

The school year lasts from 1 October to 30 June. There are school holidays on 1 December (National Day) and at Christmas, Shrovetide (a few days' break during the hot spell) and Easter (10 days).

The schools listed above, which prepare pupils for examinations coming within the French educational system, follow the pattern of French schools but their curricula are adapted, or are in process of being adapted, to local conditions. The staff has the same qualifications as in France except that the classes for the first secondary cycle are often taught by primary teachers.

The pupils are enrolled on the strength of an entrance examination, and so far the number of successful candidates has never exceeded the number of places available. The intention is to establish a system of competitive scholarship examinations.

The school results depend on the mode of life of the pupils: those able to take advantage of the boarding arrangements achieve much better results than the others. Class promotion depends on the marks obtained during the year. Pupils who repeat a class and still fail to get good results are discharged or redirected. The agreed principle is that the first-year class (*classe de sixième*) should serve as a testing ground.

The percentage figures for examination successes are similar to those for corresponding examinations in France, but a considerable number of the pupils abandon their studies on taking their *brevet*, as the average age is higher. This applies particularly to girls, who are at a disadvantage in this respect, for it was only in October 1959 that the Girls' College initiated its fourth-year class (*classe de troisième*) which completes the lower cycle of secondary studies.

Technical training is given at a vocational school run on the lines of a French *centre d'apprentissage* and including the following sections: carpentry, metal-work, motor car mechanics, clerical and book-keeping.

The instruction given at the agricultural school is essentially practical.

The short-course college at Bambari provides an additional year of teacher training to prepare pupils who have their *brevet* for service as assistant teachers at primary schools.

There is also a trade school (*école artisanale*) for boys which trains primary certificate holders in carving, bookbinding, leather work or basketwork, and a trade school for girls at the same level and comprising two sections: sewing and embroidery, cutting and dressmaking.

TRENDS AND PROBLEMS

The aim of the present programme is to enlarge the scope of the second cycle of secondary education so as to train at least 50 *bacheliers* a year (the present figure is 3 or 4) and to develop short-course colleges in the provincial centres.

Educational progress can be followed year by year thanks to an annual report prepared at the beginning of March on the basis of reports from the various headmasters, and the applications for financial assistance made to the Aid and Co-operation Fund envisage its further extension.

[*Text prepared by the Ministry of Public Instruction and Labour, Bangui, and transmitted by the French National Commission for Unesco in May 1960.*]

STATISTICS

Population (mid-year 1958 estimate): 1,161,000.
Area: 241,699 square miles; 626,000 square kilometres.
Population density: 5 per square mile; 2 per square kilometre.

Summary of school statistics, 1953–57. In 1957/58, the total school enrolment of 47,254 pupils represented about 4 per cent of the population. Almost all (97 per cent) of these were in primary schools. The proportion of girls was 16 per cent in primary schools, 14 per cent in secondary schools, and 54 per cent in vocational courses. In the public schools, the average number of pupils per teacher was 59 in primary schools, 57 in secondary schools, and 14 in vocational courses. Between 1953 and 1957, total enrolment increased by 53 per cent. (See Table 1.)

Enrolment trends in secondary education, 1950–57. Secondary school enrolment (general and teacher training) increased more than four times from 237 in 1950 to 1,044 in 1957. However, the number of pupils enrolled in vocational courses, after rising from 606 in 1950 to 1,734 in 1953, dropped back to 436 in 1957. For all types of secondary education the total enrolment during this period averaged less than 1.5 per cent of the estimated population 15–19 years old.

Examination results in secondary education, 1953–56. The annual number of certificates granted for the years 1953/54, 1954/55, 1955/56, 1956/57, was as follows: lower secondary certificate (*brevet*) 21, 29, 32, 55; *baccalauréat*, 1st part, 4, 3, 4, 6; *baccalauréat*, 2nd part, 2 (1955/56); vocational proficiency certificate 4 (1955/56); 3 (1956/57).

Educational finance, 1958. For 1958, the education budget amounted to 694 million French francs. Including an amount of 187 million francs allocated for 1958/59 from

the Investment Fund for Social and Economic Development (FIDES), the average expenditure per inhabitant was about 760 francs. Total subsidies to private education amounted to 160 million francs. (See Table 2.)

REPUBLIC OF CHAD

THE EDUCATIONAL SYSTEM

On 28 November 1958, Chad became a Republic and a Member State of the French Community. Previously, it had been a territory within the federation of French Equatorial Africa and had been governed by decrees and orders issued by the French Government, the Governor-General of French Equatorial Africa or the Governor of the Territory.

Some basic legal texts relating to the organization of education and to its functioning have been specifically repealed; others have lapsed, and those still in force must, in any event, be revised to form part of a general system adapted to the country's new political status.

Among the main instruments responsible for the present educational pattern are:

Order of 2 January 1937 of the Governor-General of French Equatorial Africa laying down the general organization of education in the federation.

Order of 28 July 1941 of the Governor-General laying down the organization of educational services.

Order of 6 July 1949 of the Governor-General organizing the general inspectorate and education services in French Equatorial Africa, as amended by the Order of 30 December 1953 and later by the Order of 1 February 1954.

Decree of 3 February 1955 of the Government of the French Republic on the division of powers in regard to the creation of educational institutions in French West Africa and French Equatorial Africa.

Order of 18 December 1952 of the Governor-General of French Equatorial Africa regulating the administration of schools financed by the budget of the federation.

A bill is now before the Chad National Assembly which would make school attendance compulsory for both boys and girls between the ages of 6 and 14 in all parts of the country where there are sufficient schools. In view of the low school attendance rate (14.1 per cent), this is the immediate objective.

French is spoken in Chad, and its school pupils are taught in that language, which is a unifying element for the many different races among its people. However, an Arabic dialect more or less related to literary Arabic predominates in the northern part of the country. For this reason, a Franco-Arab College was founded at Abéché in the Ouaddaï region; it gives its pupils thorough classical Arabic as well as French instruction.

Education is still insufficiently developed in the Republic of Chad, since only 55,648 children out of 390,174 of school age were receiving it on 1 January 1960, although the annual increase in the school population is about 20 per cent.

There are now 46,666 children in public primary and 7,307 in private primary schools, 1,120 in general secondary education, 353 in secondary technical education and 200 in teacher training at secondary level.

There are no higher educational institutions in the Republic of Chad. Teaching at this level is provided by the French Republic, at its expense, in the institutes, higher professional schools and faculties of France. This situation is likely to change; a university was recently founded at Dakar (Senegal) and a Centre d'Etudes Supérieures is being set up at Brazzaville (Congo). Young people wishing to continue their higher studies are liberally provided with grants and allowances by the Government if these studies interest the country.

Except for higher education, which is the responsibility of the French Republic, all educational levels are supervised by the Government of the Republic of Chad; French curricula and methods, adapted to African conditions, are followed.

The Government has entrusted the supervision of teaching to the Minister of Education, who is the highest authority in this sphere and acts through the Directorate of Education. The Directorate's functions are to ensure the proper operation of the schools, see that the curricula are observed and adapt the teaching methods to suit local needs. Regional authorities have no concern with the internal administration of education, except as regards the maintenance of public order.

Private bodies do not at present play any part in education. The creation of an Education Council is, however, in contemplation, with members chosen from among the most prominent persons in the public and private organizations concerned with education.

THE DEVELOPMENT OF SECONDARY EDUCATION

General secondary education is of relatively recent origin, having been organized by the Order of 20 January 1944 of the Governor-General of French Equatorial Africa, which officially instituted the Ecoles Supérieures des Territoires. The oldest, the *collège* at Bongor, was set up in 1942; the *collège* at Fort-Lamy was founded in 1947 and that at Abéché in 1952. *Cours complémentaires* (primary continuation courses) were opened at Fort-Archambault and Moundou in October 1959.

Teacher training has been provided since 1959 at the Pedagogical Centre at Bongor. Prior to that, student monitor and student teacher sections were operating at Moundou and at Fort-Archambault.

Technical education has been provided at the Vocational School at Fort-Archambault since 1951 and at the Professional Technical and Vocational Training Centre at Fort-Lamy, founded in November 1958.

Administration

The Directorate of Education is under an official appointed by the French Republic in agreement with the Republic

of Chad. His title is Director of Education and *Inspecteur d'Académie.* The Directorate has six departments: personnel, accounting and supplies, scholarships and examinations, educational information and documentation, school health, youth and sport.

Two sub-directorates are also planned, one of which will control all primary educational activities, while the other will establish regulations and settle disputes between the three levels of education.

The Director of Education has a permanent right of inspection over all staff. In practice, however, inspectors-general appointed by the French Republic are responsible for inspecting secondary classical and modern institutions and technical schools. As a rule these inspectors visit the Republic of Chad every year. One of their duties is to propose the appointment or promotion of French teachers provided under the technical assistance programme of the French Government; more generally it is their responsibility to give teachers all advice and educational instructions which may be necessary.

Finance. Education is financed out of the budget of the Republic of Chad. At the end of the year, each institution addresses a financial statement to the Directorate of Education, with budget estimates for the next school year in regard to staff, equipment, maintenance of buildings, operating expenses, etc. On this basis, the Directorate of Education draws up estimates for the year and submits them at the budget session of the National Assembly. After the vote, funds are distributed to the various schools, in proportion to the amounts applied for, and within the limits of the total appropriation for education.

Valuable assistance has been granted to the Republic of Chad since 1948 by the Investment Fund for Economic and Social Development (FIDES) and, since 1959, by the Fund for Assistance and Co-operation (FAC) and the European Development Fund for Overseas Countries and Territories (FEDOM). The Organisation Commune des Régions Sahariennes (OCRS), whose field of action includes the northern part of Chad, is also to participate very shortly in the financing of education and especially in the building and equipping of schools. A 3-year plan and several projects for improving the school infra-structure have recently been submitted to these organizations and are now under review.

Under the technical assistance conventions concluded with the States of the Community, France pays the salaries of established French teachers who are seconded to these States. All locally recruited staff are paid from the Chad budget.

Both primary and secondary education are free in the Republic of Chad. The Government also makes a large contribution to the maintenance of pupils by supplying them with clothing and opening free school canteens attached to the schools. The secondary schools have boarding establishments in which the majority of the pupils live.

Buildings and equipment. The secondary schools are all of recent construction and meet modern space, health and security requirements, taking into account, however, the exigencies of an equatorial climate. They are permanent buildings and are also provided with the usual equipment of European secondary schools. However, their present capacity being regularly insufficient to absorb the influx of pupils from primary schools, a plan of expansion has been submitted to the Fund for Aid and Co-operation.

School welfare services. The Public Health Service is generally responsible for supervising the health of children and teachers in Chad schools. Both pupils and teachers are given check-ups at regular intervals by the staff of state hospitals and dispensaries. They also receive free care at these establishments.

A School Health Office was established under the Directorate of Education in February 1960. This is to be followed by the construction of a School Medical Preventive Centre at Fort-Lamy, a plan for which has just been submitted to FEDOM. School health supervision will then be under the Ministry of Education.

TYPES OF SECONDARY EDUCATION

General and technical secondary education is reserved to pupils who are at least 11 to 13 years old, who have acquired basic study habits in primary school and enough general culture to benefit from more advanced schooling and choose a special subject or technique. Great importance is attached to general education in secondary curricula, even in the technical institutions.

Pupils from the final class of primary school who wish to continue their studies in a secondary institution take an entrance examination, held every June. The examination comprises three tests: the study of a text, an arithmetic test and a dictation test. In June 1960, there will be more than 2,800 candidates for this examination, which is in effect competitive, since the number of pupils who pass will be limited by the number of vacancies in the secondary schools.

Pupils are admitted to the following institutions:

College at Bongor. This school gives a short modern course (4 years of study) leading to the lower secondary school certificate (*brevet d'études du premier cycle* or BEPC).

College at Abéché. The Franco-Arab College at Abéché enables children from the Arabic-speaking regions of the North to continue their studies in French while developing their knowledge of classical Arabic. The object of this school is to give a long bilingual modern course (7 years of study), but at present it has only 4 classes. The pupils prepare for the BEPC; when the enrolment increases, they will be able to continue their studies as far as the *baccalauréat.*

Félix Eboué College. The Félix Eboué College at Fort-Lamy gives a complete classical and modern course. The first cycle lasts 4 years and leads to the BEPC; the second lasts 2 years and takes pupils up to the first part of the *baccalauréat;* at present, because of the difficulty of recruiting science teachers, there are no terminal classes which prepare for the second part of the *baccalauréat.* It is expected that these terminal classes—philosophy, experimental sciences and elementary mathematics—will be instituted at the beginning of the 1960 school year.

Cours complémentaires. The complementary courses at Fort-Archambault and Moundou last 4 years and lead to

the elementary certificate (*brevet élémentaire* or BE) and the BEPC; the course ends with the 3rd class. Each of these schools now has one 6th class, but there will be two 5th classes at the beginning of the 1960 school year.

Pedagogical Centre. The Pedagogical Centre at Bongor has two sections for student monitors and one section for student teachers. The student monitors, who hold a primary certificate, undergo 2 years of pedagogic training before taking a final examination and becoming educational monitors for literacy classes (preparatory course and elementary course).

Once they have their BEPC, student teachers receive one year's pedagogic training, after which they are appointed as probationary assistant teachers and are authorized to teach in all primary classes.

Vocational School at Fort-Archambault. This school has a 3-year course for masons, carpenters, fitters, motor-car mechanics, and electricians. On passing out they obtain a vocational proficiency certificate (*certificat d'aptitude professionnelle*) and may be given employment as qualified technical staff or go on to higher studies in a vocational or technical school of the French Republic.

Centre of Professional and Technical Training at Fort-Lamy. This centre trains subordinate staff for government service and private business, such as office employees, accountants, and shorthand-typists.

The training at these two technical institutions lasts 3 years and consists of specialized technical courses as well as of methodically graduated general educational courses. After the third year of school, pupils undergo training periods in government departments, banks and commercial institutions. On passing out, they receive a vocational proficiency certificate.

The Professional and Technical Training Centre of Fort-Lamy is to be greatly developed in the near future. The Government plans to add to it new sections for topographers, surveyors, radio operators, male nurses, sanitary inspectors and veterinary assistants; the centre is to be in general charge of training specialists in the various professions necessary to the public service.

Diplomas. The diplomas granted in Chad are identical with those of the French Republic and have the same value. They are valid throughout the French Community. All examinations are held under the responsibility of the Director of Education. The subjects for the *baccalauréat* and for some technical examinations are supplied by the Rector of the Academy of Bordeaux and the papers are corrected by that university.

Teaching staff. In contrast to primary education, where most of the teachers are local citizens, secondary education is almost entirely in the hands of teachers from France who belong to the staff of the French Ministry of Education, or teachers under contract recruited on the spot who hold a *licence* or at least a full *baccalauréat* (for general guidance courses in the lower cycle). Scholarship holders from Chad now studying at French higher educational institutions will, when they return to their country, be able to take their place as secondary teachers and thus gradually replace the French staff.

Out-of-class activities. In the time-tables of the above-mentioned secondary schools the afternoons of Thursdays, Sundays and public holidays are generally given over to activities and games—athletics, volley-ball, basket-ball, etc. Highly successful broadcasts for young people have been made with the assistance of a number of secondary school pupils. Societies have been founded in most of the main centres, with the purpose of attracting young people to sport or educational activities and helping them to make a better use of their leisure time.

TRENDS AND PROBLEMS

A mere enumeration of the educational resources of the young Republic of Chad is enough to show that the structure of its general and technical secondary education is, as yet, embryonic.

The isolated geographical position of the country in the heart of Africa seems to be the main reason why it has been late in absorbing Western civilization. It has also been necessary to convince the people that attending school is useful, and in the past there has often been great resistance to this idea.

In any case, Chad, which has now reached a decisive moment in its history, considers that education for the people and the training of an elite are among its most urgent objectives.

An increase in school attendance is obviously the first stage. Children who finish primary school and who are capable of continuing their studies must be able to enter a general or technical secondary school, if possible as boarders, since the families of most of them are of very modest means. There are two aspects to this problem: the foundation of new secondary schools and expansion of existing ones, the training and recruitment of teachers. In both cases, the investment of large sums must be authorized.

Moreover, young people who have received this training must find a place in the new economic structure. Chad is in urgent need of teachers, health officers, technicians, and administrative staff of all categories. Every young citizen must be directed towards the profession which best suits both his capacities and the needs of his country. The question of vocational guidance in relation to the social and economic advancement of this young State is another national problem.

[*Text prepared by the Department of Education, Fort-Lamy, and transmitted by the French National Commission for Unesco in March 1960.*]

STATISTICS

Population (mid-year 1958 estimate): 2,600,000.
Area: 495,368 square miles; 1,283,000 square kilometres.
Population density: 5 per square mile; 2 per square kilometre.

Summary of schools statistics, 1953–57. In 1957/58, the total school enrolment of 33,312 pupils represented less than 1.5 per cent of the total population; 98 per cent of these pupils were in primary schools. Girls were about 11 per cent of the total enrolment. The average number of pupils per teacher was 55 in the primary schools, 27 in the secondary schools, and 10 in the apprenticeship centres and vocational courses. School enrolment more than doubled between 1953 and 1957. (See Table 2.)

Enrolment trends in secondary education, 1950–57. While the number of pupils enrolled in secondary schools grew from 106 in 1950 to 485 in 1957, and in vocational courses from 157 to 217, the average total enrolment for the period 1955–57 was only about 0.2 per cent of the estimated population 15–19 years old.

Examination results in secondary education, 1953–56. The number of certificates granted each year for the years 1953/54, 1954/55, 1955/56, 1956/57, was as follows: lower secondary certificate (BE and BEPC), 19, 36, 25, 38; *baccalauréat*, 1st part, 2, 2, 1, 6; *baccalauréat*, 2nd part, 1 (1954/55); 4 (1955/56).

Educational finance, 1958. For the year 1958, the educational budget, including an allocation for 1958/59 from the Investment Fund for Economic and Social Development (FIDES), amounted to 866 million French francs, or an average of 333 French francs per inhabitant. (See Table 1.)

2. Including teacher training.

REPUBLIC OF THE CONGO

Formerly a part of French Equatorial Africa, the Republic of the Congo has a centralized system of education. The Ministry of Education maintains public primary and secondary schools and exercises control over the private schools. State aid is granted to private schools to the level of 80 per cent of the salaries of qualified teachers.

Funds for education are derived entirely from the state budget, of which in 1958 about 26 per cent was devoted to education. Assistance from France through the FIDES fund forms part of a 4-year plan (1958–62) and is directed mainly to building costs for secondary schools and teacher training centres.

The school system closely resembles the French pattern. After a 6-year primary course pupils take an examination that gives access to secondary schools of either the long or the short form. In the long form, the *lycée* and *collège*, the 7-year course is divided into two cycles, 4+3, leading to the *baccalauréat*. The short form corresponds to the first cycle and leads to the lower secondary certificate (*brevet*), this type of secondary school is gradually being developed from complementary courses.

Training courses for primary school teachers are given in separate establishments and in sections of some secondary schools. Technical education is provided in apprenticeship centres and vocational training courses, one of which prepares skilled artisans in an accelerated 1-year period of training. One complete *collège technique* has recently been established by the expansion of a vocational school.

[*Text prepared by the Unesco Secretariat in June 1960 from official sources.*]

STATISTICS

Population (mid-year 1958 estimate): 780,000.
Area: 134,749 square miles; 349,000 square kilometres.
Population density: 6 per square mile; 2 per square kilometre.

Summary of school statistics, 1953–57. In 1957/58, an enrolment of 82,221 pupils represented 11 per cent of the total population. Of these pupils, 96 per cent were enrolled in primary schools, over 2 per cent in general secondary schools, and less than 2 per cent in vocational courses. Girls were 28 per cent of the enrolment in the primary schools, 24 per cent in the secondary schools, and 35 per cent in vocational courses. Private schools enrolled more pupils than public schools at the primary level, but somewhat less at the secondary level. In the public schools, the pupil-teacher ratio was 62 for primary schools, 22 for secondary schools, and 18 for vocational courses. Between 1953 and 1957, total enrolment increased by 39 per cent. (See Table 2.)

Enrolment trends in secondary education, 1950–57. Enrolment in secondary schools, including teacher training, more than doubled between 1950 and 1957, but in vocational courses there was a gradual decrease. The proportion of girls changed in the same direction as the respective enrolments. Throughout this period the average secondary enrolment represented about 4 per cent of the estimated population 15–19 years old. (See Table 3.)

Examination results in secondary education, 1953–56. Table 4 shows an overall increase in the number of certificates granted each year after 1953, but the trend is mixed as regards the different types of certificates. Leaving certificates (*brevets*) from industrial and commercial schools were given for the first time, in 1956/57, to 3 pupils.

REPUBLIC OF DAHOMEY

THE EDUCATIONAL SYSTEM

As the educational system in Dahomey was organized under the auspices of France, it reflects the educational concepts of metropolitan France, together with an increasing desire to adapt these concepts, in appropriate cases, to the realities of the geographical and human environment in Tropical Africa.

The educational system consists in the first place of primary schooling for children between 6 and 12 (or even 13 or 14) years of age. This is now (1960) provided for 88,189 children, including 22,916 girls.

Three possibilities are open to pupils who complete their primary schooling: (a) Those who, during their first 4 or 5 years at school, have not shown any marked liking or aptitude for theoretical study, can receive training in rural or agricultural work or craftsmanship, provided by monitors trained in apprenticeship centres. The purpose of this training, which is to be provided on an increasingly systematic basis, is to keep the adolescent in his village, while contributing towards his vocational and social advancement. (b) Children who have successfully completed the fifth primary class sit for the elementary primary school certificate (*certificat d'études primaires élémentaires*). Those who are between 11 and 14 years of age on 31 December of the current year (exemptions from these age-limits may, however, be granted) may also sit for the entrance examination to secondary schools (*lycées* and *collèges*) or technical schools. (c) Those who do not meet the above requirements but are less than 15 years of age on 31 December of the current year sit for the same examination but can be admitted only to junior teacher training courses (*cours normaux*) or to complementary courses (*cours complémentaires*).

Ethnic and linguistic factors are not taken into account in the organization of education in Dahomey, where French is the only language of wide communication. The vernacular languages (Fon, Yoruba, Mina, Nagot, Bariba and Somba) are used only for certain types of adult education (mainly through the radio).

Public education is secular and free at all levels, and primary education is compulsory.

Legislation. The main constitutional or legislative provisions governing the educational system in Dahomey as a whole were common to all the territories of French Africa from the time of the issue of the Decree of 18 October 1904, reorganizing the Government of French West Africa, until the institutional reforms instituted by the Decree of 4 April 1957, which provided for the reorganization of French West Africa and French Equatorial Africa. On 4 December 1958 the Territorial Assembly of Dahomey voted for the status of Member State of the French Community, and on 31 December 1959 French West Africa ceased to exist as a political and administrative entity.

Under the Cultural Agreement, signed in Paris on 16 September 1959 and approved in Dahomey by the Law of 19 December 1959, the Republic of Dahomey, in accordance with the provisions of its Constitution, was given responsibility for the administration of its educational services and for the organization of all forms of cultural activity. This agreement also defined the forms of aid to be provided by the French Republic and the procedures for co-operation between the French Republic and the

Republic of Dahomey in the field of education and culture.

Education in West Africa had hitherto been governed by a General Ordinance dated 22 August 1945. A number of that instrument's provisions still remain in force, while others have been supplemented, amended or deleted in the educational legislation now being drawn up in Dahomey, as in the other States of what was formerly French West Africa. The organization of the Educational, Youth and Sports Department in Dahomey was laid down in a Decree dated 22 January 1959.

Regulations concerning the status of teachers and assistant inspectors, complementary courses, secondary schools, qualifying examinations, etc. have already been issued or are being drawn up.

Role of the public authorities. These consist of the Minister of National Education of the Republic of Dahomey, assisted by a Secretary of State for Youth and Sport. The Director of Educational Services is an *Inspecteur d'Académie* placed at the disposal of the Republic of Dahomey by the French Republic, which guarantees that the diplomas obtained in Dahomey will be recognized by universities throughout metropolitan France and the States of the French Community.

Role of private organizations. The principal private organizations which play an important part in education are the Catholic and Protestant Missions. There are also a few non-denominational private schools.

THE DEVELOPMENT OF SECONDARY EDUCATION

The history of secondary education in Dahomey is essentially the history of the establishment and growth of the existing schools. The Lycée Victor-Ballot was founded in 1911 under the name of Cours Supérieur et Cours Normal de Porto-Novo; it later became the Cours Secondaire de Porto-Novo and the Ecole Primaire Supérieure Victor-Ballot (1916), the Collège Victor-Ballot (1947) and, lastly, the Lycée Victor-Ballot, with classical and modern courses (1956). The Collège Moderne de Jeunes Filles de Porto-Novo, was founded on 11 January 1943 as an upper primary school; in 1947 it became a *collège moderne* providing the short (4-year) course of secondary education (*enseignement court*) and in 1957 was expanded to provide the full 7-year course (*enseignement long*).

All other general secondary schools and teacher training establishments, both public and private, were founded after the second world war.

The history of technical education begins with a General Decree of 13 November 1918 organizing a vocational section at the Ecole Primaire Supérieure Victor-Ballot. In 1924 this section was transferred to Cotonou and became the Ecole Professionnelle Reste which was converted in 1947 into a *collège technique*, which also provided a training course for apprentices. The agricultural apprenticeship centre at Porto-Novo was set up in 1952 and the apprenticeship centre at Ina in 1959. Private technical education is provided by a technical section attached to a general secondary school and by an apprenticeship centre for domestic economy and craftsmanship.

Administration. The organization of secondary education is now the responsibility of the Ministry of National Education of Dahomey. The Educational Sub-Commission of the National Committee for the Ten-Year Plan was entrusted in 1959–60 with the planning of educational development.

The Minister of National Education has sole authority for modifying the plan for the organization of technical education, after consultation with the *Inspecteur d'Académie*, the Director of Technical Education, the heads of schools and the teachers' councils. An Advisory Committee on Technical Education, now in process of formation, will be consulted in due course.

Conferences of Ministers and Directors of Education of the various States of the French Community are held periodically in Paris to discuss their joint problems with the assistance of the French Ministry of National Education and, in particular, of the Directorate for Co-operation with States of the Community and Other Countries and of the Institut Pédagogique National.

Control. Under the authority of the Minister of National Education of Dahomey, the *Inspecteur d'Académie* controls the central services which include: the administrative offices, an information and vocational guidance office, a directorate of primary education, a directorate of technical education, and a youth and sports department.

General secondary education is under the direct supervision of the *Inspecteur d'Académie.* The *lycées* have management boards (*conseils d'administration*), while the *collèges* and teacher training schools have management committees (*bureaux d'administration*), which meet twice a year under the chairmanship of the Minister of Education or his deputy, the *Inspecteur d'Academie*, and consider all problems relating to the administration and development of these schools.

The technical schools are directly subordinate to the central administration, the *conseils d'administration* merely acting in an advisory capacity.

The Minister of Agriculture is consulted on technical problems concerning the organization of agricultural education.

Technical education is controlled by an Inspector of Technical Education, placed under the authority of the *Inspecteur d'Académie.*

Inspection. In compliance with Article 9 of the Cultural Agreement of 16 September 1959, the French Republic organizes general inspection missions which in their own right inspect the work of administrative staff and teachers employed by the French Republic and may, at the request of the Government of the Republic of Dahomey, inspect the work of other staff as well. The cost of these missions is borne by the French Republic.

In accordance with Article 8 of the same agreement, 'an official having at least the rank of *Inspecteur d'Académie* shall be placed at the disposal of the Republic of Dahomey, under the terms laid down in the regulations in force in the French Republic, and the Republic of Dahomey agrees to accept such official.

'The *Inspecteur d'Académie*, who shall be in charge of the resident inspectors, shall be responsible for the super-

vision of all teachers employed by the French Republic. He shall also be responsible for inspecting the work of other staff.

'He shall be specifically responsible for organizing and sanctioning under the conditions laid down by the French Republic, competitive and other examinations entitling candidates to diplomas, certificates or other qualifications current in the French Republic.

'On behalf of the Government of the French Republic, he shall give notice of any changes in the curricula and examinations provided for in Article 14. The Government of the Republic of Dahomey shall entrust this official with the supervision of educational services, under the authority of the responsible Minister.'

Inspection of teacher training and complementary courses and their staff is the direct responsibility of the Director of Primary Education and of the primary education inspectors, who must hold a proficiency certificate known as the *certificat d'aptitude à l'inspection primaire* or CAIP, either for metropolitan France or for overseas territories.

Technical schools are inspected by an official seconded from metropolitan France.

Parents' associations are represented on the management boards and committees of the various schools, and on the central planning body (*Comité du Plan*), scholarship commissions and any other commission required to handle major questions of concern to education.

Finance. The secondary schools are, in principle, financed by the national budget of Dahomey, but in practice they are largely subsidized by France.

Most of the cost of school buildings and equipment has been borne by a French government fund, the Investment Fund for Economic and Social Development (FIDES), which has now become the Assistance and Co-operation Fund (FAC). It is hoped that aid will also be forthcoming from the European Development Fund for Overseas Countries and Territories (FEDOM).

Funds are allocated to schools under the budget for national education, which amounts to approximately one-quarter of the total budget of Dahomey—a relatively large proportion which, however, still falls short of needs.

Locally recruited teachers, auxiliary teachers (*auxiliaires*) and teachers working under contract (*contractuels*) are paid out of funds drawn from the national budget. Technical assistance staff recruited from metropolitan France, including fully qualified African staff [e.g. teachers holding the *certificat d'aptitude professionnelle de l'enseignement secondaire* (CAPES)] is paid by the French Republic, while the Republic of Dahomey refunds to metropolitan France 20,000 C.F.A. francs a month for each staff member. Travel and subsistence allowances are paid by the French Republic (FAC).

The staff of private schools receives from the Republic of Dahomey a subsidy amounting to 60 per cent of the salary of equivalent teachers in public schools. Private schools also receive a bonus for each pupil who passes his examinations. For the erection of school buildings, private and public school buildings, private and public schools alike can obtain subsidies from FAC.

Pupils attending public schools pay no fees. A very liberal scholarship system enables all children of needy parents to be maintained in secondary boarding schools free of charge. In actual fact, nearly all boarders hold scholarships which are a considerable burden on the national budget. Secondary school boarders' scholarships now amount to 48,000 C.F.A. francs a year.

Most young people who continue their studies at the university receive scholarships which, until last year, were charged to the general budget of French West Africa. Scholarships for students sent to metropolitan France are now charged to the budget of Dahomey. A category D scholarship amounts to 5,200 NF a year, plus travelling expenses every two years and various other allowances for clothing and holidays.

Students attending the University of Dakar all receive university grants amounting to 152,000 C.F.A. francs a year, this sum being charged to the metropolitan budget for higher education. Dahomey gives these students an additional monthly allowance of 2,300 C.F.A. francs, pays the fare between Cotonou and Dakar and grants various other allowances (e.g. for clothing).

Buildings and welfare services. Secondary schools, both public and private, fulfil modern standards of hygiene and equipment. Medical supervision and care, measurements, vaccination, etc., are the responsibility of the School Medical Inspectorate. Pharmaceutical products are paid for by the schools within the limits of their budget, and each school has a sick-room.

TYPES OF SECONDARY EDUCATION

Schools providing general education or teacher training may be divided into the following categories:

1. Classical and modern *lycées* and *collèges*, a 7-year course, the classes being known as sixth, fifth, fourth and so on up to the first, which is followed by a terminal class. After 4 years' study, that is at the end of the third class, pupils may sit for the lower secondary school certificate [*brevet d'études du premier cycle* (BEPC)]. They then have a choice between: (a) continuation of secondary studies (second, first and terminal classes) which prepares them for the first and second parts of the *baccalauréat*, all series; (b) taking a competitive entrance examination for the second class in teacher training schools (*écoles normales*), where they first prepare for the *baccalauréat* and then for the teacher's certificate (*certificat d'aptitude pédagogique*), which will make them fully qualified primary teachers (*instituteurs*); (c) direct entrance into the preparatory training year of the junior teacher training courses (*cours normaux*), after which they will have the status of trainee assistant teacher (*instituteur-adjoint stagiaire*). After obtaining the *baccalauréat*, students may continue their studies in metropolitan France or at Dakar, as Dahomey is not yet able to provide higher education.
2. Junior teacher training courses (*cours normaux*). These provide a 4-year course for pupils who pass the entrance examination for the sixth class (i.e. first-year class) in secondary schools. Pupils are prepared for the elementary certificate (*brevet élémentaire* or BE) after which they undergo 1 year's professional training. Free board is

provided for those who undertake to serve for 10 years as assistant primary teachers, first as trainees and later as fully qualified teachers once they have obtained the *certificat élémentaire d'aptitude pédagogique* (CEAP).

3. *Cours complémentaires.* These provide a 4-year post-primary course and prepare pupils for the BE or the BEPC. These pupils have the same openings as those who pass the BEPC at the end of the third class (fourth year) in *lycées* and *collèges.*
4. As yet Dahomey has no *école normale* (teacher training school at upper secondary level) of its own. Pupils passing the entrance examination for this type of institution [see 1(b) above] have therefore been attending one of the inter-territorial teacher training schools—for boys at Dabu (Ivory Coast) or Sebikotone (Senegal), and for girls at Rufisque (Senegal). Pending the establishment of a full *école normale* in Dahomey, pupils who pass the competitive entrance examination will in future continue preparing for the *baccalauréat* in a *lycée* or *collège* and, after the *baccalauréat,* will receive a year's professional training at the Ecole Normale de Formation Professionnelle which is to be opened in October 1960.

In all these schools, the time-tables and curricula are the same as those in corresponding establishments in France, except for a few adjustments in history, geography, natural science and civics.

At the Conference of Ministers of Education of the States of the French Community, held in Paris from 10 to 13 February 1960, and at the Meeting of Ministers and Directors of Education of Tropical African Countries, organized by Unesco at Addis Ababa from 16 to 20 February 1960, it was agreed that curricula and textbooks should continue to be adapted to local needs without, however, adopting a narrow approach incompatible with true culture.

The academic year runs from mid-October to 13 July, with 10 days' holiday from 24 December to 2 January and 1 week's holiday at Easter (from Easter Thursday to the following Thursday). Schools are also closed on all public holidays.

Vocational and technical schools

Agriculture. The apprenticeship centre (*centre d'apprentissage*) at Porto-Novo (3-year course) prepares pupils for the vocational proficiency certificate (*certificat d'aptitude professionnelle* or CAP) in agriculture. The curriculum includes such general subjects as French, mathematics, science, geography and physical training, together with technical subjects. The pupils attend training periods in model farms approved by the Ministry of Agriculture.

Commerce and distribution. Commercial training is provided in the practical commercial sections of the *collège technique* at Cotonou, in the vocational classes attached to this college and in the commercial course attached to the private secondary school of Notre-Dame des Apôtres at Cotonou, which prepares pupils for vocational proficiency certificates in shorthand and typewriting and office work.

Domestic economy and dressmaking. Three-year courses in these subjects are provided by the school of Notre-Dame des Apôtres, where the curricula and general organization are much the same as in apprenticeship centres in metropolitan France. This school prepares pupils for vocational proficiency certificates in domestic economy and dressmaking.

Technical and industrial schools. The technical college at Cotonou has an industrial section for electricity and engineering. The apprenticeship centre attached to this college consists of five sections (general engineering, automobile engineering, carpentry, masonry and electricity) and prepares pupils for the corresponding vocational proficiency certificates. These schools have much the same organization and curricula as their equivalents in metropolitan France.

The rural crafts apprenticeship centre at Ina trains 'polyvalent' artisans for the building and engineering industries. The pupils have 40 hours' lessons a week, 30 of which are taken up with practical work, 3 with draughtsmanship and 7 with general subjects (French, mathematics and science). The course last for 3 years and is followed by 1 year's practical work in villages under the supervision of the centre.

TRENDS AND PROBLEMS

The Education Sub-Commission of the Committee for the Ten-Year Plan proposed that a *lycée* providing full classical and modern studies should be opened at Parakou in 1961, and that a boys' *lycée* and a girls' *lycée,* both providing classical and modern studies should be opened later at Cotonou.

A big effort will be made to arrange for the establishment of 4 new *cours complémentaires* in October 1960, 4 in 1961, 4 in 1962 and 4 in 1963, in order that each administrative district may be provided with an establishment of this type.

[*Text prepared by the Ministry of National Education, Porto-Novo, and transmitted by the French National Commission for Unesco in May 1960.*]

STATISTICS

Population (mid-year 1958 estimate) 1,725,000.
Area: 44,696 square miles; 115,762 square kilometres.
Population density: 39 per square mile; 15 per square kilometre.

Summary of school statistics, 1953–57. In 1957/58, the total enrolment, fairly evenly divided between public and private schools, consisted of 78,224 pupils, or less than 5 per cent of the total population. About 3 per cent of these pupils were in secondary schools. Girls made up 28 per cent of the enrolment in primary schools, 29 per cent in general secondary schools, 36 per cent in vocational schools. In the public schools, the average number of pupils per teacher was 45 in primary schools, 27 in secondary schools

and 15 in the *collège technique*. Between 1953 and 1957, there was a 40 per cent increase in total enrolment. (See Table 3.)

Enrolment trends in secondary education, 1950–57. Enrolment in secondary education roughly tripled between 1950 and 1957. However, for the period 1955–57, it still represented less than 2 per cent of the estimated population 15–19 years old. (See Table 2.)

Examination results in secondary education, 1953–56. The number of certificates granted each year for the years 1953/54, 1954/55, 1955/56, 1956/57 was as follows: lower secondary certificates (BE and BEPC), 107, 155, 192, 117; *baccalauréat*, 1st part, 25, 40, 65, 50; *baccalauréat*, 2nd part, 18, 20, 47, 49; industrial and commercial certificates (*brevets*) 1, 4, 1, 6; vocational proficiency certificates (CAP) 28, 38, 33, 45.

It may be noted that the total number of certificates granted in 1956 was much less than the year before, due to a sudden drop in the number of *brevets* for the completion of the lower stage of secondary studies, and in the number who passed the 1st part of the *baccalauréat*. However, compared with 1953, there was an increase in every category of certificate, the total for all categories being in 1956 higher by nearly 50 per cent.

Educational finance, 1958. For the year 1958, the government budget for education amounted to 1,883 million French francs. In addition, there was an allocation of 113 million francs from the Investment Fund for Economic and Social Development (FIDES), bringing the total to nearly 2,000 million francs, averaging about 1,160 francs per inhabitant. Subsidies to private education, from both the government budget and FIDES, amounted to some 232 million francs, or nearly 12 per cent of the total expenditure. (See Table 1.)

GABON REPUBLIC

THE EDUCATIONAL SYSTEM

The most recent regulation defining the structure of education in Gabon is Decree No. 4153/IGE, published in the *Journal Officiel de l'Afrique Equatoriale Française* (Brazzaville) on 30 December 1953. As a result of the political changes in the former territories of French Equatorial Africa, this regulation is in general no longer applicable, but some of its provisions are still valid. Gabon has, in fact, retained the basic principles and—for the time being, at least—the administrative structure of the educational system laid down by this instrument.

According to Article I of the decree, education in French Equatorial Africa was under the control of an Inspector-General with an office at Brazzaville, who was responsible to the High Commissioner and appointed by him. In Gabon and each of the other territories, education came under the *Inspecteur d'Académie*, subordinate to the Inspector-General.

Under the Preamble to the Constitution of the Republic of Gabon and Article 4 (Relations between the Assembly and the Government), the Government of the Republic is responsible, as from 1958, for 'the organization and principles of education'. A Ministry of National Education was created at Libreville and the District Inspectorate became the Education Department, the *Inspecteur d'Académie* being the head of the Department. The spheres of jurisdiction of these authorities are being redefined and the legal basis will be modified accordingly.

Gabon is divided into nine prefectures—an administrative division which has no apparent connexion with the geographical distribution of ethnic groups and vernacular languages. Moreover, because modern ideas have gained acceptance in some parts of the country more than in others—and possibly, too, because some ethnic groups are more adaptable than others—there are wide differences in school attendance. This gives rise to a number of local problems, which are in theory solved by the adoption of a

common official language, French. In fact, however, the solution of these problems is delayed by traces of tribal rivalry, although these are dying out.

Religious problems cause little difficulty; the provision of schools has in fact been an integral part of the establishment of missions. In each religious zone, therefore, the majority of the schools belong to the first confession established there. In areas with a large number of schools there is generally 'peaceful coexistence' between the public education system and private education.

The Ministry of National Education of the Republic of Gabon recognizes the following types of education: private schools, which from 1 January 1960 have been sub-divided into Catholic schools (21,404 primary and 592 secondary school pupils), Protestant schools (3,471 primary and 129 secondary school pupils); and public schools (24,341 primary and 1,349 secondary school pupils).

The heads of public secondary schools are directly responsible to the *Inspecteur d'Académie.*

There are four primary education zones, in each of which a primary inspector, assisted by one or more heads of the educational sections, is responsible for educational affairs. From an administrative point of view, complementary courses (*cours complémentaires*) are under the jurisdiction of primary inspectors, but in the statistics given below they are grouped with secondary schools because they cater for pupils in the 12 to 18 age group and provide a course which is at the same level as the first cycle (4 years) of secondary education proper.

THE DEVELOPMENT OF SECONDARY EDUCATION

There was no secondary education in Gabon before the second world war. Mention should be made, however, of the instruction, comparable with secondary education, provided by the little seminary at Libreville, dating back to 1845. Some of the best pupils from this school used to be sent to France.

It was not till 1944 that a higher primary school (*école supérieure*) was established. It became a *collège* in 1947, and a *lycée* in 1958. Similarly, in 1953, a private *école supérieure* became the *Collège Bessieux.*

There has been a marked increase in the number of secondary and higher primary school pupils, as the following figures show: 90 pupils in 1944, 185 in 1948, 430 in 1952, 950 in 1956, and 2,070 in 1960.

It is noteworthy that there has been no pause in this rapid increase, as there has been in the number of primary pupils, which did not rise between 1953 and 1955 because of economic difficulties (the slump in okoume wood) and insufficient funds.

Technical education also came into being during the war. Enrolments at the Owendo Vocational School rose steadily, from 18 pupils in 1942 to 110 in 1950. In the last few years, there has been no increase—indeed, the numbers have fallen; but the school is now being made into a *collège technique* (technical secondary school), which should give a fillip to this branch of education.

The Law of 22 June 1959, which makes education compulsory in Gabon for 'children and adolescents from 6 to 16 years of age', is likely to bring about radical changes in the structure of education in Gabon. It will be some years, however, before it has any appreciable effect on general and technical secondary education.

Administration

As already stated, the regulations governing the general organization of secondary education in France also apply to the Republic of Gabon. Secondary school examinations and certificates are the same. The same qualifications are required of teachers from France, who either work under contract to the Government of the Republic of Gabon or are seconded by the French Ministry of Education for employment in Gabon.

The *Inspecteur d'Académie*, who is the head of the Education Department, is responsible to the Ministry of National Education, Youth and Sport for the observance of both French and local regulations concerning secondary education. He has direct authority over general and technical secondary schools, and the Gabon Teacher Training School, and indirect authority over *cours complémentaires*, through the primary school inspectors. Some specialized educational institutions, which will be mentioned later, come under other ministries.

The work of the teachers in secondary schools is assessed at regular intervals by the competent department and, where possible, by inspectors-general from France, who represent the French Ministry of Education.

School buildings are financed through funds made available by the Fonds d'Aide et de Coopération (FAC—Assistance and Co-operation Fund), which has superseded the Fonds d'Investissement pour le Développement Économique et Social (FIDES—Investment Fund for Economic and Social Development). However, equipment for boarding-schools, classroom furniture, etc., are purchased from the local budget's operational funds.

Teachers working under contract are paid by the Government of Gabon from the local budget, whilst teachers from France who are seconded to Gabon have since 1 January 1960 been paid by France, with the help of credits from the FAC.

All Gabon pupils are entitled to free secondary education, provided that they have passed the competitive entrance examination. Pupils who win resident scholarships are entitled to board, lodging, clothes, textbooks and transport to their homes for the summer holidays. Those obtaining non-resident scholarships receive a monthly grant of 3,750 francs if their parents do not live in the city and 2,400 francs if they do. These scholarships are financed from the local budget.

School equipment and buildings must conform to the standards required in France, adapted to suit local conditions, with particular reference to climate.

TYPES OF SECONDARY EDUCATION

Pupils who have completed the primary course may enter: a complete secondary school (*lycée* or *collège*); a complementary school providing a short modern course; a junior teacher training school (*collège normal* or *cours normal*) at lower secondary level; a technical secondary school (*collège*

technique); or a specialized school of agriculture or forestry.

Pupils taking the competitive entrance examination, which is the same for all the above types of course, are entitled to indicate which studies they prefer. They are guided in their choice by their class teacher and by a Vocational Guidance Centre, whose function it is to spread information on this subject, particularly by radio broadcasts.

At the conclusion of the secondary course, pupils are free to choose the type of course they wish to pursue. The Vocational Guidance Centre supplies them with full information on advanced courses and opportunities for employment in Gabon.

The school year is divided up in the same way as in France. The chief modification to suit local conditions is that, for climatic reasons, most of the lessons are held in the morning.

General secondary schools

Secondary education as such is given in two schools providing a full course similar to the schools in France—the *lycée* at Libreville (a public school) and the Collège Bessieux (a Catholic school). The course lasts 7 years, divided into two cycles (4+3) and leads to the *baccalauréat*.

The *cours complémentaires* provide a 4-year course at the level of the first cycle of secondary studies and prepare pupils for the lower secondary certificate [*brevet d'études du premier cycle* (BEPC)]; the best pupils can then enter the second cycle of the full course at a *lycée* or *collège*.

The public education system includes one *cours complémentaire* in each district—a total of 9 such schools. Except for the Port-Gentil school, founded in 1957, they were opened only in 1958 and therefore will not have all four lower secondary classes until October 1961. The object—which has already been attained in part—is of course to encourage more pupils to remain at school after the primary course, but also to decentralize education and extend its emancipating influence to country districts. There is a risk, however, that once the labour market is saturated the standard of the certificate awarded at the end of the first cycle (BEPC) will tend to fall as a result of the rapid development of this type of education.

The Catholic and Protestant missions each run a *cours complémentaire*, at Oyem and Bitam respectively.

Vocational and technical schools

The only school of this type in Gabon is the Collège Technique at Libreville. It was originally a trade school (*école des métiers*) which provided training in carpentry and joinery. At the end of the 3-year course an apprenticeship certificate was awarded. In 1953, the trade school was converted into a vocational school (*école professionnelle*) with two additional sections—fitting and masonry. In 1958 the school was moved from Owendo to new premises at Libreville, and by the Law of 22 June 1959 it became a *collège technique*, with an apprenticeship centre and a crafts department (*section artisanale*) attached. It is proposed to open a commercial section for the forthcoming school year.

At present the competitive entrance examination for the *collège technique* is taken at the end of the fourth class (technical division)—the third year of the secondary course, but in future admission will be by a competitive entrance examination for pupils in the sixth class (first year of the secondary course). Pupils are admitted to the apprenticeship centre when they have reached the standard of the *certificat d'études primaires* (CEP—primary certificate), at the age of 14 to 16, by competitive examination; admission to the crafts department is by examination.

Curricula and time-tables are the same as in French technical schools. The apprenticeship centre trains carpenters, cabinet-makers, auto mechanics and fitters, and prepares pupils for the vocational proficiency certificate [*certificat d'aptitude professionnelle* (CAP)] in these subjects. The crafts department was opened in November 1959; it will provide a 4-year course. The first-year curriculum at present provides for 6 hours' general instruction and 24 hours' vocational training.

Teacher training schools

The Gabon Junior Teacher Training School (Collège Normal du Gabon), at Mitzic, was opened in 1952. It trains primary teachers and prepares them for the certificate obtainable at the end of the first cycle of the secondary course—the *brevet élémenatire* or *brevet d'études du premier cycle* (BEPC). The course therefore includes 4 years' general instruction and 1 year's professional training; the pupils gain practical experience at the practice school attached to the teacher training school.

A plan to extend the course year by year has been carried out, and the number of pupils has risen rapidly—117 pupils in 1956/57, 147 in 1957/58, 192 in 1958/59 and 215 in 1959/60. When, in the near future, the Collège Normal du Gabon (lower secondary level) becomes the École Normale du Gabon (upper secondary level) the educational system will have acquired the one training establishment it has so far lacked.

The Catholic mission operates teacher training courses at Mouila and (for girls) at Libreville, while the Protestant mission has a similar institution at Lambarene.

Other specialized schools

Agricultural Training Centre (*Oyem*). This centre, which was established in 1945, comes under the Ministry of Agriculture. It has the two following sections: an agricultural apprenticeship centre, which gives practical instruction in agriculture, and the Territorial School of Agriculture, which admits pupils from public or private schools who have completed the lower cycle of the secondary course.

In the first of these two sections pupils can obtain the vocational proficiency certificate (*certificat d'aptitude professionnelle*) and in the second a certificate called the *brevet professionnel*. In the 11 years between 1947 and 1959. 83 agricultural instructors (*moniteurs agricoles*) obtained their certificates in the Apprenticeship Centre and 11 agriculturists (*agents de culture*) were trained at the Territorial School.

The Forestry School at Cape Estérias. This school is controlled by the Forestry Department. Pupils are admitted either on application or by competitive examination. The school also admits scholarship holders from other countries and those sponsored by private firms.

The Forestry School periodically arranges practical courses for the training of qualified forestry workers for private firms. The school's statutes are drawn up by the Forestry School Council, consisting of the Minister of Forestry, the chairman of the Forestry Association, the chairman of the Chamber of Commerce, the director of the Gabon section of the Technical Centre for Tropical Forestry and the head of the Gabon Forestry Department.

Out-of-class activities

The Federation for Out-of-School Education [*Fédération des Œuvres Post- et Périscolaires* (FOPPS)], which was established in 1958, is affiliated to the French League of Education (Ligue Française de l'Enseignement). It plays an active part in arranging exchange visits of young people between the Republic of Gabon and France or other members of the Community. It organizes training courses for holiday camp monitors under the guidance and leadership of specialists from Paris.

In 1960, a film club was established and began its activities—an entirely new phenomenon in Libreville. Photography and amateur film production sections will shortly be added.

Various plans are in hand for the near future, among which the following deserve special mention: organization of free classes for adults, leading to the elementary certificate (*certificat d'études élémentaires*) and to the various other certificates; establishment of a department responsible for organizing and extending the system of holiday camps; establishment of an art education department; opening of a public library; establishment of a girls' and women's department, whose task will be to improve the social and human lot of African women.

The interest aroused by the early achievements of the FOPPS encourages the belief that all these projects may be realized in the near future.

TRENDS AND PROBLEMS

Since secondary education has been extended throughout the whole country by the establishment of *cours complémentaires* in the principal towns of each district, national education in Gabon has acquired a firm basis, which will enable the number of schools to be increased sufficiently to meet the country's needs for many years to come. It is to be expected that the *cours complémentaires* will tend to become *collèges* and that new vocational subjects will be taught in the *collège technique* or in separate new schools. It is probable, too, that, owing to the rapidly increasing number of secondary school pupils, classes will have to be opened to prepare pupils for the higher professional schools (*grandes écoles*) in France, and this will be the first step towards the establishment of the future University of Gabon.

[*Text prepared by the Ministry of National Education, Youth and Sport, Libreville, and transmitted by the French National Commission for Unesco in May 1960.*]

STATISTICS

Population (mid-year 1958 estimate): 417,000.
Area: 102,317 square miles; 265,000 square kilometres.
Population density: 4 per square mile; 1.6 per square kilometre.

Summary of school statistics, 1953–57. In 1957/58, the total enrolment was 40,919, or about 10 per cent of the population. Primary school pupils accounted for 97 per cent of the total enrolment, which was distributed almost equally between public and private schools. The proportion of girls was 34 per cent in the primary schools and 16 per cent in the secondary schools. In the public system, the average number of pupils per teacher was 48 in the primary schools and 44 in the secondary schools. Between 1953 and 1957 total enrolment increased by 39 per cent. (See Table 1.)

Enrolment trends in secondary education, 1950–57. Between 1950 and 1957 the number of pupils enrolled in secondary schools more than doubled. The average total enrolment in secondary education, for the period 1955–57, was about 3 per cent of the estimated population 15–19 years old.

Examination results in secondary education, 1953–56. The number of certificates granted each year for the years 1953/54, 1954/55, 1955/56, 1956/57, was as follows: lower secondary certificate (*brevet*), 36, 72, 43, 69; *baccalauréat*, 1st part, 4, 18, 13, 19; *baccalauréat*, 2nd part, 10 (1956/57); vocational proficiency certificate (CAP) 4, 6, –, 12. The total number of certificates granted in 1956 was two and a half times as many as in 1953.

Educational finance, 1958. For the year 1958, the budget for education amounted to 571 million French francs, averaging 1,370 French francs per inhabitant. A further sum of 79 million francs was allocated to education from the Investment Fund for Economic and Social Development (FIDES) for 1958/59, the total expenditure therefore being 650 million francs, or 1,560 francs per inhabitant. Subsidies to private education amounted to some 173 million francs. (See Table 2.)

REPUBLIC OF THE IVORY COAST

THE EDUCATIONAL SYSTEM

The educational system of the Republic of the Ivory Coast is similar to that of France. No appreciable change has been made in the educational structure at the various levels, in the curricula or in the examinations.

As a consequence of the adoption of the Organic Law of 1956 and the institution of the *Communauté*, control over all branches of education has been transferred to the Republic of the Ivory Coast, which, since 1 April 1959, has also exercised the powers previously vested in the *Recteur* of the Dakar *Académie* as head of the joint service of the group of French West African Territories for the co-ordination of education, culture and research.

The educational activities of the Republic are directed by a Ministry of National Education, a Ministry of Technical Education, and a Youth and Sports Secretariat.

Special agreements for technical co-operation between the French Republic and the Republic of the Ivory Coast in the educational sphere are at present under discussion.

By Order No. 2984/DE/3 of 23 December 1959, the Ministry of National Education set up a Directorate of Education which, in addition to the offices responsible for personnel, equipment, accounting, scholarships and examinations, comprises four important sections: a school buildings and equipment section; an educational section for the various types of instruction; a physical training and school sports section; and an adult education section.

A Higher Education Centre was established at Abidjan in 1958. It functions with assistance from the University of Paris, which provides teaching staff and organizes examinations based on the curricula in force in the French faculties. This centre is now preparing students for the examinations which conclude the year of preparatory studies for university entrance (literature and science) and the first year of legal studies. It may be expected to play an increasingly important part in the training of secondary school teachers.

In addition to the state schools, which come under the authority of the Ministries of Education and of Technical Education or of certain other Ministries (such as Agriculture and Health), there is a fairly large number of private schools, the majority of which provide secondary education. The Directorate of Education issues permits for these institutions (which are set up and directed by Catholic and to a lesser extent Protestant missions), supervises their staff, and makes grants towards their running expenses.

There are also a few private vocational schools; these are supervised by the Ministry of Technical Education and their pupils take the examinations organized by that Ministry.

THE DEVELOPMENT OF SECONDARY EDUCATION

Prior to 1950, secondary school teaching was among the responsibilities of the General Directorate of Education, with headquarters at Dakar, which was itself under the joint supervision of the French Ministries of Overseas France and Education. In 1950, an *académie* for French West Africa was established at Dakar. A *Recteur*, appointed by interministerial decree, was entrusted, under the authority of the High Commissioner of the French Republic in French West Africa, with responsibility for all educational matters in the territories comprised within the jurisdiction of the *académie*.

Considerable powers were subsequently vested in the governments of the individual territories, under the Organic Law of 23 June 1956 and 4 April 1957 on the new institutions of French West Africa—though the *Recteur* of the Dakar *Académie* was still responsible for co-ordinating the educational activities of all territories.

In 1958 all the powers of the *Recteur* were transferred to the governments of the individual territories.

Administration

The administration of education is the responsibility of the Central Government, which adapts it to the teaching plans drawn up at the interministerial level. The regional authorities in the administrative sub-divisions assist in the building and upkeep of school premises, and in the administrative supervision of teaching staff.

French law applies in all matters of secondary education, including the organization of teaching and administration (curricula, time-tables, enrolment, examinations, etc.) and the recognition of schools and of staff qualifications.

Inspection is carried out by inspectors-general of the French Republic, who are sent on mission at the request of the Government of the Ivory Coast.

Finance. (a) Working expenses: those of the secondary schools are met from the state budget, except for the salaries of teaching staff from metropolitan France, which are paid from the Assistance and Co-operation Fund (FAC). (b) Capital investment: the building of secondary schools was financed at first—from 1948 to 1959—from a special fund instituted by the French Government, the Investment Fund for Economic and Social Development (FIDES). As from 1959, FIDES became the Assistance and Co-operation Fund (FAC). A further source of capital investment is the European Development Fund for Overseas Countries and Territories (FEDOM) set up by the European Economic Community. (c) Scholarships: the state budget defrays the maintenance expenses of scholarship holders.

TYPES OF SECONDARY EDUCATION

As in France, two types of general education are provided in the *lycées* and *collèges;* one of these is short (4 years) and the other long (7 years). The former is also provided in the primary complementary courses (*cours complémentaires*). The short 4-year course leads to the lower cycle secondary certificate (*brevet d'études du premier cycle* or BEPC) or the elementary certificate (*brevet élémentaire* or BE). The long course supplements this by 3 further years of study (second cycle) leading to the different *baccalauréats* which, as in France, comprise various sections (classical or modern).

Technical education also differentiates between the short course given in *collèges techniques*, which leads to the industrial diploma, and the long course in the *lycées techniques*, which leads to the *baccalauréats techniques*. There is also, however, a form of technical education known as the 'primary technical and vocational training course', which is given chiefly in the vocational training schools (*centres d'apprentissage*) and leads to the vocational proficiency certificate (*certificat d'aptitude professionnel* or CAP) in various crafts.

The secondary school year follows the French pattern.

General secondary schools

The public secondary schools of the Republic of the Ivory Coast comprise 1 *lycée*, 8 *collèges*, 17 *cours complémentaires*, 1 teacher training school and 7 teacher training courses[1], with a total enrolment of 6,777 pupils; the private section comprises 8 secondary schools, 2 *cours complémentaires* and 3 teacher training courses, with a total enrolment of 1,614 pupils. In all, therefore, there are 1 *lycée*, 16 *collèges* and secondary schools, 19 *cours complémentaires*, 1 teacher training school and 10 teacher training courses, with a total enrolment of 8,391.

Examination results. During the two examination periods in 1959 (June and October), 96 pupils obtained the *brevet élémentaire* (35.5 per cent of successes) 453 the *brevet d'études du premier cycle* (53 per cent of candidates), while 90 successfully passed the examination in the first part of the *baccalauréat* (34 per cent of candidates) and 50 in the second part of the *baccalauréat* (46 per cent of candidates). During the same year, 2,039 pupils, including 246 girls, were admitted to the first-year class in secondary schools, this being equivalent to 42 per cent of the pupils taking the entrance examination. The proportion of girls is steadily increasing, and the educational and social problems resulting from their access to secondary schools are now being studied.

Teaching staff. In 1958 the teaching staff of secondary schools included 5 headmasters with *licences*, 2 *censeurs* or directors of studies, 3 teachers holding *agrégations*, 30 teachers holding primary teacher's certificates or *licences*, 20 assistant teachers and 35 headmasters or teachers in *cours complémentaires*.

The number of Africans in primary school teaching is rapidly increasing, but this is not the case in secondary schools, where the staff is almost entirely French. Students from the Ivory Coast are now receiving higher education either in France, at the University of Dakar, or at the Higher Educational Centre at Abidjan, and in the near future will be able to take a hand in running the *lycées* and *collèges* of their own country.

Vocational and technical schools

The Republic of the Ivory Coast includes among its educational facilities a *lycée technique* for boys, where the curriculum comprises the following specialized subjects: general mechanics, carpentry, commercial course, shorthand-typing, and surveying. Pupils prepare for the *baccalauréat technique*, the industrial teachers' diploma, the commercial teacher's diploma or the preliminary surveyor's diploma. Three *centres d'apprentissage* prepare pupils for the vocational proficiency certificate (CAP) in the following subjects: auto mechanics, metal fitting, boilermaking, electrical fitting, masonry, carpentry and joinery, clerical work, shorthand-typing, book-keeping. A school of pottery and ceramics trains craftsmen, pottery being still the principal branch of handicrafts in this area. There are also in-service training courses for state employees, building workers and commercial staff, and intensified vocational training courses for the following branches of employment: shorthand typists, clerical staff, refrigeration mechanics and printers. In October 1959 these vocational training courses were attended by 460 students, or 60 more than the previous year. The Village Assistance Service trains village craftsmen at a *centre d'apprentissage*.

Mention should also be made of the recent opening of a rural technical centre at Gagnoa, as the first step in the government programme to improve the conditions and standard of living of the country people.

Teaching staff. The teaching staff for technical education, the majority of whom come from France, consisted in 1958 of 4 assistant technical teachers, 4 supervisors, 2 teachers of general subjects, 10 foremen, and 13 skilled workers and monitors supervising manual teaching.

Since October 1959 the vocational centres for women have been under the authority of a specialized service for the teaching of domestic occupations. The rapid expansion of technical education for girls is reflected in the examination results: 23 CAPs were awarded in 1959 (12 for domestic work, 7 as mothers' helps and 4 for sewing), as compared with only 1 in 1958.

There are a few private vocational schools, most of them commercial or for girls, which prepare pupils for the CAP. Of the 29 commercial CAPs issued by the Ministry in 1958, 4 went to pupils from private schools.

Other specialized schools. There is a vocational training school of agriculture (*centre d'apprentissage agricole*), which is run by the Ministry of Agriculture, a preparatory and technical school of military training (at Bingerville), and an arts school, also at Bingerville, which is a private establishment receiving a grant from the public authorities.

Teacher training schools

Primary school teachers (*instituteurs*) are trained at a teacher training school of the French type. At present it has 107 pupils. There is a competitive entrance examination,

1. These schools will be considered later under the heading 'teacher training schools'.

but since 1957 the school has also been providing teacher training for any holders of the *baccalauréat* who wish to take up primary school teaching as a career.

Ten teacher training courses (3 of them private) train students as assistant teachers (*instituteurs-adjoints*); candidates must be holders of the BE or the BEPC; the course lasts 12 months.

TRENDS AND PROBLEMS

The former 4-year plan sought to increase school attendance and train as many qualified teachers as possible. To this end, it aimed at establishing further *cours complémentaires* with provision for boarders, to open *collèges* and to establish a *lycée* for girls and a co-educational *lycée*.

Political developments have, however, led to the drafting of a 5-year plan 'better adapted to the new circumstances of the country'.

The establishment of a teacher training service under the Directorate of Education will facilitate the study of possible reforms in the school curricula and means of improving the system and structure of education.

The extension of general and technical secondary education is one of the chief aims of the Ministries concerned, owing to the need, for the Ivory Coast, to ensure the rapid training of the administrative and technical staff required both for Africanization and for the expansion of industrialization.

[*Text prepared by the French National Commission for Unesco in March 1960.*]

STATISTICS

Population (mid-year 1958 estimate): 3,090,000.
Area: 124,503 square miles; 322,463 square kilometres.
Population density: 25 per square mile; 10 per square kilometre.

Summary of school statistics, 1953–57. There were about 131,000 pupils enrolled in all levels of education in 1957/58, being about 4 per cent of the total population. About 95 per cent of all the pupils were in primary schools. Girls constituted about one-fourth of the total enrolment. In the public schools, the average number of pupils per teacher in 1956 was 38 in the primary schools, 27 in general secondary schools, and 15 in the vocational schools. The total enrolment in 1957 was more than two and a half times as high as in 1953. (See Table 3.)

Enrolment trends in secondary education, 1950–57. Secondary school enrolment increased at such a rate between 1950 and 1957 that the average total enrolment for 1955–57 was more than twice as high as for 1950–54. Nevertheless, the ratio of secondary pupils to the estimated population 15–19 years old, still stands at less than 2 for the period 1955–57. (See Table 4.)

Examination results in secondary education, 1953–56. The total number of pupils receiving all types of certificates in 1955/56 was twice as high as in 1953/54, but there was a decrease in each category (except the second part of the *baccalauréat*) in 1956/57. (See Table 2.) More recent information is given in the text.

Educational finance, 1957. For the fiscal year beginning in January 1957, total budget expenditure for education amounted to 1,357 million C.F.A. francs, averaging about 450 francs per inhabitant. Recurring expenditure was 96 per cent of the total. Teachers' salaries accounted for 53 per cent of the recurring expenditure. (See Table 1.)

1. Data on teacher training are included with those on general education.

MALAGASY REPUBLIC

THE EDUCATIONAL SYSTEM

With the transformation of the political structure of the country, the system of education is itself undergoing change, and only a brief account of the main features will be given here.

The Constitution provides for two official languages, French and Malagasy. The Ministry of Education controls all public schools and subsidizes private schools in proportion to the number of qualified teachers and results achieved in public examinations. The central authorities legislate for education through decrees and circulars broad lines of policy, the curriculum and examination standards being the principal fields reserved for Ministry decision. The administration, inspection and financing of the schools are devolved to provincial authorities and the provincial directors of education.

The expansion of education is planned, and at present occupies a distinct place in the third four-year plan for national development (1958–62). The main educational goals of this plan are to complete the structure of higher education, decentralize secondary education, produce in technical schools the manpower at intermediate and higher level needed for production, develop rural trades and crafts and, for primary schooling, to complete the reform begun in 1951.

Funds for education are derived from the state budget, and in 1958 made up 9.7 per cent of all public expenditure. The greater part of this money is made available through the provincial authorities, which vary in the degree to which they devote funds to education. Still further decentralization to the level of districts and *communes* is being considered. For capital outlay, the state budget is assisted by FIDES funds from France, and the purpose of this aid in the 1958–62 period is mainly to construct secondary school buildings.

The inspection of secondary and technical schools is undertaken by a central inspectorate seconded from France.

TYPES OF SECONDARY EDUCATION

A unified primary school course lasting 6 years is progressively replacing the two previous types of primary school using the medium of French and Malagasy respectively. As in France, *cours complémentaires* (complementary courses) have been added to the complete primary course, and these still remain under the primary education authorities but are treated more and more as secondary schools with a short modern curriculum.

Upon completing the sixth primary grade, pupils take the *entrée en sixième* examination, provided they are over 11 and under 15 years of age. Success gives admission to the various forms of secondary education.

The academic secondary course lasts 7 years and is provided by *lycées* and *collèges* with their two cycles of study: 4 years to the *brevet*, 3 further years for the two parts of the *baccalauréat*. Curricula are similar to those followed in France; the language of instruction is French with Malagasy as a subject.

Since October 1957 as many *cours complémentaires* as possible have been developed to the full 4-year period of the first cycle of secondary education. The curriculum has been modified (e.g. through the introduction of a foreign language) so as to facilitate passage to the second cycle.

Four types of technical and vocational school are distinguished. School workshops are attached to certain centrally placed primary schools. Apprenticeship centres give a course lasting 3 or 4 years and are administered provincially, so that the curriculum corresponds in part to local needs. Vocational schools of a more specialized type are now developing. And finally, there is the *collège technique* with a full secondary course of 7 years leading to a technical *baccalauréat*.

Teacher training centres may also be regarded as vocational schools at secondary level. They were formerly sections of administrative schools (training for various government posts) but are now being established as provincial junior teacher training schools (*cours normaux*). Students take the lower cycle of secondary studies (4 years) and then a 1 year professional course. There is also an *école normale* of the French type, where students complete the *baccalauréat* before taking a 1-year teacher training course.

[*Text prepared by the Unesco Secretariat in June 1960 from official sources.*]

STATISTICS

Population (mid-year 1958 estimate): 5,184,000.
Area: 227,800 square miles; 590,000 square kilometres.
Population density: 23 per square mile; 9 per square kilometre.

Summary of school statistics, 1953–57. For 1957/58, total enrolment may be roughly estimated at 350,000 pupils, or about 7 per cent of the total population. More than 90 per cent of these pupils were in primary schools. The proportion of girls was 43 per cent in primary schools, 35 per cent in secondary schools, and 17 per cent in the Institute of Higher Studies. Between 1953 and 1957, primary school enrolment increased by 22 per cent and secondary school enrolment by 59 per cent. (See Table 3.)

Enrolment trends in secondary education, 1944–57. Enrolment in general secondary schools multiplied nearly 7 times between 1944 and 1957. In vocational education, the increase between 1944 and 1956 was even more striking; in teacher training it was less so. For the period 1955–57, the estimated average total enrolment, in all types of secondary schools, was nearly 7 per cent of the estimated population 15–19 years old. (See Table 4.)

Examination results in secondary education, 1953–57. At the end of the 1957/58 school year, 1,038 certificates were awarded for general secondary education (*brevets* and *baccalauréats*) against only 304 for the year 1953/54. Certificates of vocational education (commercial and industrial *brevets* and CAPs) were 7 times as many in 1957 as in 1954 or in 1953. Teaching training certificates reached their highest number in 1955. (See Table 1.)

Educational finance, 1957. For the fiscal year beginning in January 1957, total expenditure for education (not including agricultural and forestry education) was budgeted at 2,209 million C.F.A. francs, averaging about 450 francs per inhabitant. About 10 per cent of the total came from the Investment Fund for Economic and Social Development (FIDES). The distribution of the recurring expenditure by level and type of education is shown in Table 2B.

ISLAMIC REPUBLIC OF MAURITANIA

THE EDUCATIONAL SYSTEM

The educational system as a whole in the Islamic Republic of Mauritania is governed by Decree No. 5003 of 21 March 1959, the 85 Articles of which constitute the Code of the Teaching Profession, as envisaged in Article 3 of the General Civil Service Code (Act No. 52) of 4 July 1957.

The main factors affecting the provision of general and technical secondary education are as follows:

Geographical. Sites for schools have had to be chosen in localities comparatively easy to reach from the various parts of the Republic, for the great distances and the lack of means of communication seriously handicap all forms of public life.

Ethnical. The political necessity of mitigating or overcoming the effects of marked differences in race among the population made it essential to bring together rather than segregate the young people now being trained for posts of responsibility. The Republic accordingly established a single school for general secondary education and a single school for technical secondary education, instead of a number of small regional institutions.

Linguistic. In view of the variety of vernaculars (Hassania, Wolof, Sarakolé and Fulah dialects) and the State's links with the French Community, French was proclaimed the official language in 1959 (Arabic already being the national language). Secondary instruction is given entirely in French. Arabic is a compulsory subject, but figures in the time-table and curricula as the first foreign language. The various dialects are not taught.

Religious. Loyalty to Muslim traditions and beliefs is proving perfectly consistent with a quite manifest determination to modernize the educational system on Western lines.

The Government of the Republic includes a Ministry of Education, Youth and Information. The Minister is assisted by a technical adviser with the rank of *Inspecteur d'Académie* who acts as Director of Education. The local authorities, no matter what their level or nature, have no power to deal with secondary education as it is entirely under the central administration.

The only private institution is the Muslim Institute at Boutilimit, which was in existence before secondary education was introduced into Mauritania. It is not subject to any administration or pedagogical control but receives a grant from the Ministry of the Interior. It confines its activity to preserving the tradition of Islam (Arabic language and Islamic thought).

THE DEVELOPMENT OF SECONDARY EDUCATION

For a long time the two former territories of Senegal and Mauritania had all political, administrative and educational institutions in common and until 1945 all the secondary schools were in Senegalese territory—the Lycée Faidherbe at Saint Louis du Sénégal being sufficient to meet Mauritania's modest requirements.

The first Mauritanian school to go beyond the primary school certificate was a higher primary school which was opened in 1946, in Rosso, on the banks of the Senegal river. It was converted into a *collège moderne* in 1949. In 1953, when it looked as if Rosso was to become the capital of Mauritania, the *collège* was transferred to a new site outside the locality and accommodated in buildings designed to take 270 scholarship-holding boarders.

In 1958, the first autonomous Government of Mauritania decided to extend education rapidly among children, bring about a massive increase in secondary enrolment, and transfer the *collège* from Rosso to Nouakchott, situated on the dividing line between the two main ethnic groups in Mauritania. It was decided that the school should become a *lycée*, providing the 'long course' (*enseignement long*) of secondary schooling, divided into lower and upper cycles in the French pattern, and that it should house 700 to 800 pupils. The funds required for buildings to accommodate the first few grades of the school (300 pupils) were allotted by the Assistance and Co-operation Fund in 1960, and the school is due to open in October 1961. In the meantime the first-year class (*classe de sixième*), instituted in October 1959, is housed in temporary premises; the second-year class (*cinquième*) is to be instituted in October 1960. As the premises of the Rosso *collège* become available through the gradual transfer of secondary grades to Nouakchott, they will be used for technical instruction (as a primary technical school, at first, and later as a *collège technique*). It was also decided to run 3 *cours complémentaires* (primary complementary classes) at Atar, Aioun-el-Atrouss, and Kaédi. Such classes have been in operation in the last two localities since 1959.

Administration

All the present laws and regulations governing secondary education are contained in the Code of the Teaching Profession in Mauritania.

The general organization of education comes entirely under the Director of Education who is responsible to the Minister. The curricula, teaching methods and textbooks are, for the time being at least, the same as those for the corresponding French institutions.

School principals come under the direct authority of the central administration, all Ministry instructions being imparted to them by the Director of Education, who supervises implementation of policy. However, each school has a board of management (*conseil d'administration*) with the power to make recommendations for improving the running of the school.

The Director of Education is the only person qualified to inspect secondary schools, under the authority of the Ministry of Education, though the latter may also call in specialized inspectors for specific tasks: the administrative inspectorate of the Republic, to investigate the conduct of financial affairs, or inspectors-general of the French Ministry of Education for the various subjects. The inspectorate envisaged in the Code of the Teaching Profession will be set up when the secondary education system is large enough to warrant it.

The funds required for running the secondary schools come mainly from the national budget and partly from the French budget, under the heading of Aid and Co-operation. The appropriations made in the state budget on the proposal of the Ministry of Education for maintaining individual schools are administered by the Director of Education under the supervision of the Ministry of Finance.

Indigenous teachers and staff of non-Mauritanian nationality recruited under contract are paid from the Mauritanian budget, while teachers serving under the French technical assistance programme, i.e., regular French staff on secondment, are paid by the French Ministry of Education. No charge is made for education; on the other hand parents are given no assistance to enable them to keep their children at school.

The standards required of builders and maintenance services as regards space, heating, lighting, sanitation, safety, etc., are the same as those in force in corresponding establishments coming under the French Ministry of Education.

The medical service is staffed by the Health Department. Pupils' recreation is organized by the Youth and Sports Department of the Ministry of Education.

TYPES OF SECONDARY EDUCATION

There are three types of school providing full-time general education—the *lycée*, the *collège* and the *cours complémentaires*. There are no technical or teacher training schools.

All students who have completed their secondary studies and passed their *baccalauréat* have an opportunity to go on to institutions of higher education in France. This they are able to do thanks to state scholarships or French scholarships.

The classes begin in mid-October (end of the rainy season during which land communication is impossible) and finish at the end of June, examinations being synchronized as far as possible with those in the neighbouring States belonging to the *Communauté*. The school year is divided into three terms, with two holidays of one week in between. The schools also close on the official holidays of the Republic and the *Communauté:* 28 November (Republic Day), Christmas Day, Easter Monday, 1 May (Labour Day), 8 May (Armistice Day), Ascension Day and Whit Monday, and on the feasts of Mouloud or Gamou, El Father and Id El Ham. The summer holidays last from the evening of 13 July to the morning of 14 October.

There are no classes on Sundays, or on Thursday and Saturday afternoons, which are reserved for sports and recreation. School hours on the other days are from 8 a.m. to noon, and from 3 to 6 p.m.

General secondary schools

Admission to secondary education is by competitive

examination for entry into the first grade (*sixième*) and all pupils who have successfully completed the primary course can compete for the available places. They have three choices: the Nouakchott *lycée*, the Rosso *collège* or the *cours complémentaires* at Kaédi or Aioun-el-Atrouss. The wishes of the applicants are taken into account as far as their examination rating permits.

Subjects and teaching methods are the same as those in French state schools except that the first language has to be Arabic and the second English (all subjects other than these languages being taught in French). The weekly time-table is the same as for the corresponding sections of French secondary schools. The school results are satisfactory when one considers the resources available and especially the local handicaps: the trying climate which curtails the school year, the inadequate buildings and equipment and the uncertain supply of teachers. The examinations are organized and the results evaluated in accordance with French standards. The only national peculiarities are a strong liking for the French language (which is preferred to the mother tongue) and a marked general aptitude for the study of mathematics and grammar.

It is impossible to give a general assessment of the teaching staff. Teachers are very few in number (16 teachers in 1959–60 and 22 in 1960–61) and very uneven in quality. Practically the entire staff is renewed every year and hence teachers develop no strong attachment to the country or to their job. Furthermore, most of the teachers lack the academic qualifications for the work they perform. There are three different methods of recruitment: through the French Secretariat of the Assistance and Co-operation Fund (FAC) in the case of seconded French teachers; directly by the Mauritanian Education Department in the case of teachers engaged on contract (some of whom come from countries outside the *Communauté*, such as Tunis, Lebanon and Morocco, and others from French private schools); local recruitment of indigenous teachers. The indigenous teachers and seconded French teachers are established staff, their career (salary, promotion, changes in post) being regulated in accordance with French practice. The French seconded teachers are given home leave and have their travel expenses (to France and back) paid for them. All posts, including the administrative ones, will ultimately be filled by Mauritanians.

TRENDS AND PROBLEMS

Present policy in secondary education aims at the rapid formation of an elite so as to speed up the Africanization of the economic and administrative leadership of the nation. The training of this elite is well under way, as far as the number of children to be given secondary education is concerned, but the course is intellectualized to the highest degree, reproducing in detail the curricula and time-tables of the various sections of the French *lycée*.

Two problems are therefore likely to arise in the near future. The first will be that of finding employment for all secondary leavers. Failing a revolutionary change in the methods of producing the national wealth, and a rapid increase in population (of which there is at present no sign) Mauritania's needs in technicians and administrators will remain extremely limited. If Mauritanians are appointed as soon as possible to every post now held by non-Mauritanians, and for which a complete secondary education is the minimum qualification, all such posts will be filled by 1967. From that date onwards, however, the number of secondary leavers will be much greater owing to heavy intakes since 1958 (155 enrolments in the *classe de sixième* in 1958, 125 in 1959 and 125 in 1960).

The second problem is the adaptation of education to the country's needs. This has already been partially solved at the primary level but has yet to be taken up for secondary education. Urgent consideration needs to be given to adapting the latter to less academic ends, i.e., for purposes related to Mauritanian conditions.

[*Text prepared by the Ministry of Education, Youth and Information, Nouakchott, and transmitted by the French National Commission for Unesco in May 1960.*]

STATISTICS

Population (mid-year 1958 estimate): 640,000.
Area: 419,230 square miles; 1,085,805 square kilometres.
Population density: 1.5 per square mile; 0.6 per square kilometre.

Summary of school statistics, 1953–57. In 1957/58 there were 6,784 pupils enrolled in 97 public schools, representing slightly over 1 per cent of the total population. The great majority of these pupils were in the primary schools, where there was an average of 32 pupils per teacher. In the two secondary schools, the average pupil teacher ratio was 42. Girls represented less than 8 per cent of the total enrolment. Between 1953 and 1957, total enrolment increased by 56 per cent. (See Table 1.)

Enrolment trends in secondary education, 1950–57. Even though the secondary school enrolment in 1957 was twice as high as in 1950, it represented hardly 0.5 per cent of the estimated population 15–19 years old. The number of girls receiving a secondary education had increased from 2 in 1951 to 15 in 1957.

Examination results in secondary education, 1953–56. The total number of lower secondary certificates awarded an completion of the 4 years' schooling in a secondary school or *cours complémentaires* (the *brevet d'études du premier cycle* or the *brevet élémentaire*) was 25 in 1953, 14 in 1954, 28 in 1955, and 36 in 1956.

Educational finance, 1958. The Government budget for education in 1958 was 460 million French francs. For 1958/59 an additional sum of 68 million francs was allocated from the Investment Fund for Economic and Social Development (FIDES). The total amount from these two sources represented an average expenditure of about 825 francs per inhabitant. (See Table 2.)

REPUBLIC OF THE NIGER

THE EDUCATIONAL SYSTEM

Primary, secondary and technical education all come under the authority of the Ministry of Education, Youth and Sport. Education is provided free of charge; moreover, numerous boarding scholarships are granted as pupils are often needy and almost always separated from their families by considerable distances. There is no private secondary education.

Industrial vocational training comes under the Ministry of Labour and is financed from the proceeds of the recently instituted apprenticeship tax; technical education does not benefit from this tax.

The Ministries of Health, Agriculture and Stock Farming also run vocational schools, or apprenticeship centres, which recruit their pupils from among holders of the elementary primary certificate or at a slightly higher level.

In accordance with the Constitution, French is the official language of the Republic.

THE DEVELOPMENT OF SECONDARY EDUCATION

The circumstances peculiar to each of the former territories of French West Africa exerted an influence on the organization and operation of their respective educational services. For a long time this meant that the various elements of the educational system (courses, examinations, etc.) were of a purely local character—an arrangement which, while offering immediate advantages, presented drawbacks in the long run.

As development proceeded at an ever increasing pace, the need was felt for local leaders and, at the beginning, these could only be trained in France. Unless they held French educational qualifications, candidates had to give up the idea of further studies or of specialization in certain branches. After the adoption of the 1946 Constitution, therefore, the organization of the school system and in particular the examination system were brought into line with those obtaining in France.

Legal basis

French legislation is still in force in the Republic of the Niger with respect to organization into stages, curricula (adapted to local requirements in so far as the natural sciences, history and geography are concerned), time-tables, teachers' duties, examinations. Compulsory schooling cannot, of course, be implemented in a country where only 6 per cent of the children of school age are enrolled in schools.

Administration

There is no advisory council for secondary education. The adaptation of curricula, and the revision of textbooks which would be entailed by such adaptation, are being considered by the Conference of Ministers of Education of the *Communauté*. It is highly doubtful whether it would be worthwhile issuing special editions of textbooks for each State of the *Communauté*, or even for French-speaking Tropical Africa and Equatorial Africa. Accordingly, the revision will largely be embodied in loose-leaf insertions.

The Ministry of Education has only one Directorate of Education. At the head of the educational services is an *Inspecteur d'Académie* provided by the French Republic in accordance with the Cultural Convention of 11 September 1959. He exercises direct control over the principals of secondary schools (*collèges*) and vocational training schools (*centres d'apprentissage*), and indirect control over the persons in charge of teacher training courses and primary complementary courses (*cours complémentaires*); the latter provide instruction equivalent to the first cycle of secondary education but are subject to supervision by the primary school inspectors. This system is modelled on the administration of education in France at the level of the *département*.

Management boards (*conseils d'administration*) modelled on those in metropolitan France, were at one time set up for the existing *collège* and teacher training courses. In France, however, the chief task of these boards is to draw up the draft budget for the schools in question. In the Niger, where schools have no individual income and school budgets are incorporated in the general budget for education, and where, moreover, leaders in the liberal professions or in commerce and industry are still very few in number, the administrative boards had no essential purpose to serve and soon became dormant.

The supervision of general secondary schools and other schools of the same level is ensured mainly by the *Inspecteur d'Académie*. In compliance with the above-mentioned Cultural Convention, general inspection missions (inspectors-general specialized in particular subjects, and in technical education) are sent out from France. These missions inspect members of the teaching staff who are established teachers of the French Republic and, if requested to do so by the Republic of the Niger, they also supervise the other members of the teaching staff.

Parents' committees play only a small part (as advisers) in a clearly defined field (community life).

Finance. The funds required for education at the various levels are provided by the State, which controls their employment. These funds are paid in to a special agency which operates at the administrative level of the *cercle* (administrative district). The principals of schools, assisted by bursars, draw up their budgets. The agency checks these budgets and makes the necessary payments. At Niamey, the Directorate of Finance is responsible for such checking and payments.

Secondary schools and technical schools have been built mainly with the help of subventions received from France and paid out of the Investment Fund for Economic and Social Development (FIDES); they are now paid out of the Assistance and Co-operation Fund (FAC). On the other hand, the costs of furniture and equipment have nearly always been borne by the Niger.

With regard to teachers' salaries, members of the established staff working under the French programme for technical assistance are remunerated by the French authorities, who also pay their travel expenses. Staff engaged under contract, whether or not recruited in France, may be partly remunerated under the technical assistance programme. Lastly, the salaries of local staff holding the same university degrees and the same diplomas as the European staff are, in principle, paid out of the state budget (though there are a few exceptions).

Substantial funds are provided for scholarships. In fact, the great majority of the pupils are scholarship-holders whose entire expenses are borne by the State, which provides them with education, board and lodging, clothing, the means of transport and pocket money.

Buildings and equipment. The standards applied are those defined by the regulations in France relating to school buildings.

School welfare services. Education does not as yet have any medical or social services of its own. Teachers and pupils are fully cared for in state hospitals in the event of sickness or accident.

TYPES OF SECONDARY EDUCATION

Secondary education is at present represented by: (a) a *collège*, providing a full course of study up to *baccalauréat* standard and also comprising a commercial technical section; a *collège* for girls is to be established in the near future; (b) a teacher training school (for men and women teachers), opened at the beginning of the 1960 school year; (c) three teacher training courses for assistant teachers; (d) four *cours complémentaires*, similar to those in France and designed, like the latter, to provide guidance for pupils (the number of these courses will be increased to 7 by October 1960); (e) a *centre d'apprentissage* with four sections: masonry, motor car mechanics, metal work, electronics; the course is to be extended from 3 to 4 years, and a *collège technique* is to be established later on.

Pupils from the Niger may also attend schools in the other States of the *Communauté* which are members of the *Conseil d'Entente* (for instance, the technical secondary schools of the Ivory Coast), as well as in France (secondary schools, agricultural or industrial technical schools, various higher professional colleges).

Once pupils are admitted to a school, it is the principal or the council of teachers, assisted by the University Statistics Bureau, that advises them on any changes which may seem necessary in the orientation of their studies.

A uniform entrance examination has been instituted for secondary schools and other schools of the same level. Pupils are distributed among the schools according to their age, examination results, family situation, mode of life (nomads must necessarily be placed in boarding-schools) and geographical origin. The vocational training school selects its pupils on the basis of psychological and technical tests.

On completion of their secondary studies, pupils who have obtained the *baccalauréat* are eligible for scholarships from the Republic of the Niger or from the French Republic, enabling them to attend classes which prepare them for the higher professional schools or faculties (Dakar, Higher Educational Centre of Abidjan, faculties in France).

The school year lasts from 1 October to 30 June; it comprises three terms of almost equal length, separated by holidays (8 or 10 days) at Christmas and towards the end of March or the beginning of April. The weekly time-table is the same as that observed in schools in France—6 class hours per day (4 in the morning and 2 in the afternoon). As in France, the main subjects are taught in the morning; however, owing to the heat which prevails during the greater part of the year, physical exercises have to take place in the evening or very early in the day.

General secondary schools

The curricula and teaching methods applied in the *collèges* and assimilated schools are the same as those obtaining in the corresponding schools in France, apart from very slight adaptations of the curriculum to meet local conditions.

The same similarity exists with regard to achievement testing, reporting on pupils (school-record books, quarterly reports, observations by the Disciplinary Council), promotion from one class to another and examinations (primary certificate; lower secondary certificate; *baccalauréat* in philosophy, mathematics, experimental sciences, and now also the *baccalauréat technique*).

Vocational and technical schools

The Ministry of Agriculture has a *centre d'apprentissage agricole* at Kollo, near the rice-fields of the Niger, for the training of agricultural instructors. Entrants are required to have completed their primary studies.

The Ministry of Stock Farming recruits, subject to the same conditions, local veterinary attendants, who are trained at the Maradi school, now in process of reorganization.

The Ministry of Health has a school for assistant nurses (both men and women). Candidates are recruited subject to the same conditions as those obtaining in the two schools mentioned above.

All these schools provide both theoretical and practical training, more importance being attached to the latter.

Out-of-class activities

The pupils elect class heads to represent them *vis-à-vis* the principal; these representatives can also be heard by the Disciplinary Council. Each school has a co-operative, sometimes a journal, a small dramatic club, a troop of Boy Scouts, and sports clubs which are to be regrouped under the aegis of a School and University Sports Office, in liaison with similar offices in other States of the *Communauté* as well as in the French Republic.

TRENDS AND PROBLEMS

Beyond all other educational problems in the Niger is the overriding necessity for a rapid increase in the number and capacity of schools, so that education may be democratized and made accessible to the largest possible number of pupils. The Niger, which is an agricultural and pastoral country, has to train technicians; it has also to train up the leaders it needs. Secondary education benefits from the long experience gained by France, and also faces some of the problems of the French system.

[*Text prepared by the Ministry of Education, Youth and Sport, Niamey, and transmitted by the French National Commission for Unesco in May 1960.*]

STATISTICS

Population (mid-year 1958 estimate): 2,490,000.
Area: 458,995 square miles; 1,188,794 square kilometres.
Population density: 5 per square mile; 2 per square kilometre.

Summary of school statistics, 1953–57. In 1957/58, there were more than 12,000 pupils enrolled in school, of whom over 95 per cent were in the primary schools. This total enrolment represented less than 1 per cent of the total

population. In the primary schools the proportion of girls was 29 per cent, women teachers were 15 per cent of the whole teaching staff, and there were on the average 36 pupils per teacher. Primary school enrolment increased by 80 per cent between 1953 and 1957. (See Table 2.)

Examination results in secondary education, 1956–57. The number of certificates granted each year for the years 1956/57 and 1957/58 was: lower secondary certificate (*brevet*), 44, 41; *baccalauréat*, 1st part, 12, 19; *baccalauréat*, 2nd part, 2, 3.

Educational finance, 1957. For 1957, the education budget was 369 million C.F.A. francs, including 41 million francs from local revenues. In addition, there was an allocation, for the period 1956/57, of 61 million francs from the Investment Fund for Economic and Social Development (FIDES), which brought the total expenditure to 430 million francs, or an average of about 180 francs per inhabitant. Capital expenditure, including funds from the government budget and FIDES, accounted for 30 per cent of the total. (See Table 1.)

REPUBLIC OF SENEGAL

THE EDUCATIONAL SYSTEM

General and technical secondary education, which are at present patterned on the French system, are under the authority of the Ministry of Education and Culture and the Secretariat of State for Technical Education. In addition to its primary and secondary education departments, the Ministry has departments for physical education, youth and sport, fundamental education, and for medical inspection and school hygiene.

Dakar University has the same organization and method of operation as a French university, and the *Recteur* and teaching staff are members of the metropolitan civil service. The teaching and examinations are exactly the same as in French universities.

Apart from the university, all educational matters are under the jurisdiction of the Government of the Republic of Senegal. The transfer of powers from the French Government to the Government of Senegal took place in several stages: first in application of the *Loi-cadre* of 23 June 1956, then within the framework of the French Community; lastly, in 1959, the powers still retained by the *Recteur* of the Dakar *Académie* in respect of the co-ordination of educational, cultural and research services in the territories of French West Africa were also transferred to the respective governments.

There are both public schools and private confessional schools. The latter, which prepare pupils for the same examinations as the public institutions, receive subsidies varying in amount according to the qualifications of their teachers and the success of their pupils in examinations.

The Central Government has included in the third four-year economic and social development plan (1958–62) a scheme for the development of education. In the field of general secondary schooling the projects include: (a) the development of boarding schools, of which there are at present not enough (establishment of a girls' boarding house attached to the Van Vollenhoven *lycée* at Dakar); (b) the opening of a *collège d'orientation* (guidance school) comprising all the 6th and 5th classes at Dakar and thus relieving the congestion in the *lycées;* (c) the development of secondary schools outside Dakar (enlargement of the *collèges* at Kaoleck and Thiès and creation of a new *lycée* at St Louis); and (d) arrangements for the training of more primary school teachers (completion and extension of the Ziguinchor teacher training course and enlargement of the M'Bour teacher training course).

In the field of technical education, the plan provides for

the opening of new sections at the Dakar apprenticeship centre, of an apprenticeship centre for the hotel and garment making trades, and of rural apprenticeship centres adapted to the needs of the various economic regions of Senegal.

The Directorate of Technical Education and Vocational Training is responsible for all forms of vocational and general training (school instruction, apprenticeship, accelerated training, vocational training courses, etc.). Its plans for such training must be based on the needs in the different fields (industry, commerce, agriculture, administration and the various professions) indicated by the Ministry for the Development Plan and General Economy.

The regional authorities are concerned with the building and maintenance of school premises as well as with the administrative control of the teaching staff. There is a plan for decentralizing the construction of secondary school buildings.

THE DEVELOPMENT OF SECONDARY EDUCATION

In both administrative and teaching matters all general and technical secondary schools are governed by the same statutory provisions as apply in France.

The inspection of secondary schools in Senegal is carried out by Inspectors-General sent on mission from France.

As regards finance, the operating expenses of secondary schools are charged to the state budget, with the exception of the salaries of teachers on the metropolitan establishment which are paid by the Assistance and Co-operation Fund (*Fonds d'Aide et de Coopération* or FAC).

Until 1959 the construction of secondary schools was financed by France through the Investment Fund for Economic and Social Development (FIDES), some of this money being made available to private schools. Since 1959 the Assistance and Co-operation Fund has replaced FIDES. Investment funds are also provided by the *Fonds Européen de Développement pour les Pays et Territoires d'Outre-Mer* (FEDOM).

The living expenses of scholarship holders are borne by the State.

TYPES OF SECONDARY EDUCATION

General secondary education is divided into two cycles, the first lasting 4 years (short course) and culminating in the *brevet d'études du 1er cycle* (BEPC—lower secondary certificate) or the *brevet élémentaire* (elementary certificate), the second lasting an additional 3 years (long course) and leading to the *baccalauréat*. As in France, the long course has different sections (classical and modern), in which greater stress is placed on either the literary or scientific side. The first cycle is given in the *collèges* or the *cours complémentaires* (complementary courses), while the *lycées* and some *collèges* also provide the second cycle.

The technical education given by the technical *lycées* and *collèges* also leads through a long course to the *baccalauréat technique* and through a short course to the *brevet d'enseignement industriel* (industrial education certificate). An important part in vocational training is played by the apprenticeship centres which recruit, by competitive examination, candidates who have completed their primary schooling and train them in not less than 3 years for the *certificat d'aptitude professionnelle* (CAP—vocational proficiency certificate).

The school year is the same as that in France.

In 1958 the teaching staff in secondary schools comprised 2 *proviseurs* or *directrices agrégés* (headmasters or headmistresses who have passed the *agrégation* examination), 7 graduate principals of secondary schools, 2 *censeurs* (directors of studies), 10 *surveillants généraux* (non-teaching disciplinary officers), 10 *professeurs agrégés*, 67 certificated or graduate teachers, 43 *chargés* and *adjoints d'enseignement* (assistant teachers), 8 physical training and sports instructors, and 36 principals, teachers and instructors in *cours complémentaires*. The replacement of non-African secondary school teachers by Africans is not yet complete but is making progress. In 1958, 646 students were attending institutions of higher education, 266 at Dakar and 380 outside Senegal (most of them at French universities).

In 1958 the teaching staff of the various technical training schools consisted of 4 work supervisors (*chefs de travaux*) and technical instructors, 25 assistant technical instructors and 6 teachers of general subjects. They were assisted by a number of *instituteurs* and *moniteurs* (primary level teachers).

Teacher training schools

So many children are now attending primary schools that the teacher training courses cannot turn out enough trained teachers. It has therefore been necessary to employ students who have obtained the *brevet élémentaire*, *brevet d'études du 1er cycle* or *baccalauréat*. The vocational training classes in the teacher training courses for boys have been replaced by two teacher training centres which can take 200 to 250 student-teachers each year. This rate of training is believed to be adequate for the country's present needs.

Training courses for technical school teachers are now being organized.

TRENDS AND PROBLEMS

Present trends in the Republic of Senegal include the expansion of existing secondary schools and the decentralization of education, the latter with a view to obtaining a better balance between the different regions. At the same time a major effort is being made to train the teachers needed by the country, and Senegal is studying all possible means of producing the higher grade staff it requires for its industrial, administrative and agricultural development.

Such is the object of the following principles of action laid down by the Directorate of Technical and Vocational Education: 'To supply the number and quality of workers and administrative staff needed for the organization and development of the general economy, and at the same time to facilitate that development by training, professionally and socially, as many individuals as possible to take part in it'. The Directorate, which has now taken over the responsibilities of the Accelerated Vocational Training Service, is endeavouring to find 'a satisfactory blend of

techniques and methods of vocational training and technical instruction'. The organization of an Information, Vocational Guidance and Work Psychotechnical Centre has just been completed.

The essential problem of the Republic of Senegal is thus being tackled with lucidity, and many converging efforts are being made to resolve it.

[*Text prepared by the French National Commission for Unesco in March 1960.*]

STATISTICS

Population (mid-year 1958 estimate): 2,300,000.
Area: 76,124 square miles; 197,161 square kilometres.
Population density: 30 per square mile; 12 per square kilometre.

Summary of school statistics, 1953–57. In 1957/58, total enrolment was 87,644, or about 4 per cent of the total population. The primary schools enrolled 92 per cent of these pupils, some 6 per cent of them were in secondary schools and slightly over 1 per cent each in vocational schools and at the University of Dakar. The teaching staff in public schools (not including the university) totalled 2,053 members; in the primary schools there were about 43 pupils per teacher and 31 in the secondary schools. Between 1953 and 1957, total enrolment increased by 56 per cent. (See Table 3.)

Enrolment trends in secondary education, 1950–57. Enrolment in general secondary schools more than doubled between 1950 and 1957, while that in vocational schools quadrupled between 1950 and 1956. For the period 1955–57 the average secondary enrolment represented 4 per cent of the estimated population 15–19 years old. (See Table 4.)

Examination results in secondary education, 1953–56. The annual number of certificates awarded increased from a total of 724 in 1953/54 to 1,489 in 1956/57. The increase was notable in all categories except the leaving certificates from industrial and commercial schools, where a slight reduction occurred after 1954. (See Table 2.)

Educational finance, 1958. The budget estimate for education in 1958 amounted to 3,711 million French francs; if the 266 million francs allocated for 1958/59 from the Investment Fund for Economic and Social Development (FIDES) be added, the total expenditure for education (not including the university) was over 3,977 million francs, averaging about 1,730 francs per inhabitant. (See Table 1.)

1. Including teacher training.

REPUBLIC OF SUDAN[1]

THE EDUCATIONAL SYSTEM

Education is organized on the same lines as in France. There was never any racial discrimination in the former French Union; French was the only official language, and public education was undenominational. This being so, neither racial, linguistic nor religious considerations have in any way influenced the organization of education. There are few private schools. One apprenticeship centre has been established by a semi-official body, namely, the Railways Administration of French West Africa. The Catholic Church has also opened a number of schools.

THE DEVELOPMENT OF SECONDARY EDUCATION

French West Africa, including French Sudan, which became the Republic of Sudan in 1958, was not established until 1904. Since instruction in all educational establishments was given in French, that language had to be widely enough known for general and technical secondary education to be organized.

The first stage in the development of secondary education was after the 1914–18 war, when the educated citizens who now hold administrative positions were trained.

The second stage was reached after the 1939–45 war. Assistance for the construction of school buildings was provided through grants from the Investment Fund for Economic and Social Development (FIDES). The existence of a school population of tens of thousands of pupils in primary schools justified the establishment of educational institutions at the secondary level.

Before 1939, there was only one institution providing a general secondary education—the Terrasson de Fougères Upper Primary School, at Bamako; it was converted into a *collège* in 1945 and a *lycée* in 1947. A *collège* for girls was opened in 1952. Technical education was first given at the vocational school at Bamako, which, in 1923, was transformed into an Apprenticeship Centre attached to the upper primary school. The Sudanese Crafts Centre was set up in 1932, and in 1939, the advanced technical school, which in 1950 became the Federal School of Public Works. The Frédéric Assomption Teacher Training School was founded in 1934; after a transitional period during which student-teachers (*moniteurs*) were trained, the courses offered at this school assumed their present form in 1952. In 1957, the first public complementary course (*cours complémentaire*), the first private *collège* and the first private teacher training course (*cours normal*) were opened.

Legal basis

The main laws at present in force are:

Order of 6 December 1949, modifying the organization and operation of the Sudanese Crafts Centre.

General Order of 8 March 1952, organizing teacher training courses.

Order of 12 July 1952, reorganizing agricultural education in French West Africa.

Annex to Order of 1 August 1951, defining the status of teacher training schools (*écoles normales*).

Decree of 8 August 1959, organizing complementary courses.

Law of 28 December 1959, creating the Teacher Training School at Katibougou as a Mali federal establishment.

Decree of 25 August 1959, creating an Educational Advisory Council.

Administration

Educational matters which are of purely local concern, such as development plans, are dealt with by the Ministry of Education of the Republic of Sudan, and matters of common interest by the Ministry of Education and Health of the Federation of Mali.

The Republic of Sudan is a centralized State, and the central administration has direct authority over the head teachers of educational establishments.

The Minister of Education is assisted by an *Inspecteur d'Académie*, who is responsible for the technical aspects of the education service and presides over the boards of examiners, a technical adviser on secondary education and a departmental head of technical education.

In all important matters such as development plans, the establishment of standard regulations and the organization of teaching, the Ministry of Education follows the advice of the Educational Advisory Council. *Ad hoc* commissions consisting of the *Inspecteur d'Académie*, technical advisers and qualified members of the teaching staff study questions submitted to them, such as changes in the curricula or guidance methods, under the supervision of the Minister of Education.

The Agricultural Technical School and the Agricultural Apprenticeship Centre are administered by the Ministry of Agriculture.

Private schools are subsidized by the Government, and are subject to supervision. They may be inspected by public education inspectors, and they have to submit an annual report on their work, together with statistics, to the Minister of Education.

Inspection. Inspection of general and technical secondary schools is carried out by inspectors-general from the French Ministry of Education, who are sent on inspection tours at the request of the Sudanese Government, by the *Inspecteur d'Académie* of the Republic of Sudan, and

1. Written in the early part of 1960 this text contains references to the Federation of Mali, formed by the Republics of Senegal and Sudan in 1959. Senegal withdrew from the Federation on 18 August 1960 and in September 1960 the Republic of Sudan became the Republic of Mali.

by primary school inspectors (who inspect primary teachers of complementary and teacher training courses).

Finance. The country's budget provides for the operation of general and technical secondary schools. In 1960, 493,604,000 French African Area francs were set aside for this purpose.

The federal budget of Mali provides for the operation of the only federal educational establishment, the School of Public Works.

Building and equipment are financed through the local (or federal) budget and by outside assistance, in the past, FIDES and today the *Fonds d'Aide et de Coopération* (FAC—Assistance and Co-operation Fund) and the *Fonds Européen de Développement des Territoires d'Outre-mer* (FEDOM—European Fund for the Development of the Overseas Territories).

At present, teachers are civil servants of the French Republic, seconded for technical assistance, or engaged under contract. In the first instance, they are paid by the French Republic, the Republic of Sudan reimbursing part of their salaries; in the second instance, they are paid by the Republic of Sudan, the French Republic reimbursing part of their salaries.

Public education is free. The great majority of pupils attending general and technical secondary schools in 1960 held scholarships. A sum of 10,400 French African Area francs is provided for scholarships for pupils in these schools, and the number of scholarship holders is 3,237.

Buildings and equipment. The standards observed are the same as in France, with certain modifications to suit local conditions, where necessary.

School welfare services. Medical inspection is organized in every type of school. An infirmary and an isolation ward are available for all boarders. Teachers and members of their families receive free medical treatment from doctors attached to the medical service.

TYPES OF SECONDARY EDUCATION

Admission to a general or technical secondary school is by competitive examination held at the end of the 5-year primary school course.

Educational guidance is first given by primary school head teachers in consultation with the parents. Plans now nearing completion will enable pupils to change direction at the end of the sixth class i.e., the first year of secondary schooling,[1] all sixth classes will have the same programme, and will provide opportunities for discovering the aptitudes and interests of the pupils. The work of the University Statistics Bureau, which is similar to the Bureau in France, makes it easier for a pupil to change his course, especially at the end of the first cycle (i.e. at the end of the third class). This bureau provides parents with all necessary information on the courses open to their children.

At the conclusion of the secondary school course, pupils take the *baccalauréat;* they can then enter one of the preparatory classes for the *grandes écoles* (higher professional schools) or other higher educational establishments and work for a *licence* (first degree), a doctorate, an *agrégation* (competitive degree examination) or an equivalent diploma.

The school year begins on 15 October and ends on 13 July. It is divided into three terms, separated by the winter holidays (8 days) and the spring holidays (11 days). The other school holidays are the Tabaski or Aïd el Saghir, at the end of the month of Ramadan (2 days), the Korite or Aïd el Kabir (2 days), the Maouled or anniversary of the Prophet's birth (1 day), All Saints, 11 November, 17 January (National Day), Easter Monday, 1 May, Ascension and Whit Monday. There is no school on Sundays or Thursday afternoons.

General secondary schools

'Lycées' and 'collèges' (long course). The long course lasts 7 years and is divided into two cycles (4+3). The purpose of these establishments is to give pupils the kind of education which will enable them to understand the most important problems facing mankind or having arisen throughout its history, to give pupils enough specialized knowledge to enable them to embark on higher education, to make them better human beings and good citizens, and to provide them with a proper physical training. At the end of this course, pupils sit for the *baccalauréat.*

Two examples of the amount of hours allotted per week to the different subjects in the curriculum, are as follows.

Philosophy class (seventh year): philosophy, 9; literature, 1; first foreign language, 1½; second foreign language or classical language (optional), 1½; history, 2; geography 2; mathematics and cosmography, 1½; physics, 2; natural science, 2; physical education, 2; drawing (optional), 2; music (optional), 2; handwork for girls (optional), 2; i.e., 23 hours of compulsory subjects.

Third class (fourth year): French, 3½; Latin, 3½; Greek, 3; civics, ½; modern language, 3; history and geography, 3; mathematics, 3; practical science, 1; physical education, 2; drawing, 1; music, 1; handwork, 1; a total of 25½.

To be promoted to the class immediately above, pupils must have obtained a satisfactory average mark at the tests held each term.

There are three categories of teaching staff: *chargés d'enseignement* (assistants), who hold the *baccalauréat; adjoints d'enseignement* (assistant secondary teachers), who have a *licence;* and *professeurs* (secondary teachers), who have a diploma or an *agrégation.*

Collèges (short course) and cours complémentaires. As these schools do not go beyond the third class (fourth year of secondary studies), their function is to give pupils a good general education and to prepare them for the second cycle of the secondary course. The certificate awarded at the end of these courses is the *brevet d'études du premier cycle* (BEPC)—the lower secondary school certificate.

The categories of teaching staff in *collèges* offering a short course are the same as those in a *lycée.* Teachers in *cours complémentaires* are trained either for post-primary work or for primary work, and they should preferably have

1. Classes are numbered progressively from 6th to 1st, with a terminal (7th-year) class.

passed in one or more subjects at university level. Two examples of the hours allotted each week to the different subjects in the curriculum of the third-year class are as follows.

Collège (short course): French, 5½; civics, ½; first foreign language, 3; second foreign language, 4; history and geography, 3; mathematics, 3; practical science, 1½; physical education, 2; drawing, 1; music, 1; handwork, 1, a total of 25½ hours.

Cours complémentaires: French, 6; civics, 1; foreign language, 5; history and geography, 3; mathematics and geometrical drawing, 4; practical science, 1½; physical education, 2; freehand drawing, 1½; music, 1; handwork, 2; a total of 27 hours.

Vocational and technical schools

Collège Technique d'Industrie. This school prepares pupils for the *brevet d'enseignement industriel* (industrial certificate) in automobile mechanics and electricity, and provides partial training for the *brevet d'enseignement commercial* (commercial certificate), covering the work of the third-year class.

The curriculum includes general subjects and vocational training. The following example shows the number of periods per week allotted to the various subjects in the fourth-year technical trade school class.

Humanities: French, 4; history, 1; geography, 1; English, 2; moral training, 1.

Scientific subjects: mathematics, 4; physics, 3; hygiene, 1.

Vocational subjects: technical drawing, 6; building technology, 1; technology of special subject, 1; general technology, 1; workshop practice, 14; physical education, 2; a total of 42 periods per week.

To be promoted to the class immediately above, pupils must have obtained a satisfactory average for the year or a favourable report from the teachers' council which meets at the end of the year.

The teaching staff consists of the following categories: secondary school teachers with a qualifying certificate and a *licence*, technical school teachers, assistant technical school teachers, primary school teachers and post-primary school teachers.

The Vocational Training Council and the Governing Board of the Technical Trade School include representatives of industry.

Industrial Apprenticeship Centre (with commercial section). This centre trains specialized workers, and prepares pupils for a vocational proficiency certificate (*certificat d'aptitude professionnelle* or CAP) in the following subjects: welding, reinforced concrete work, metal construction, electrical fitting, carpentry and joinery, motor car repairs, and office work. The curriculum includes scientific instruction and vocational training. The following example shows the number of weekly periods allotted to the different subjects taught in the first-year class.

Humanities: French, 4; history, 1; geography, 1; moral training, 1.

Scientific subjects: mathematics, 3; physics, 2.

Vocational subjects: technical drawing, 4; general technology, 1½; technology of special subject, 1½; workshop practice, 19; physical education, 2; a total of 40 periods per week.

Federal Public Works School. This school trains technicians for the Public Works Department, the Railways Administration and the Ordnance Survey. Pupils are selected by competitive examination at the end of the fourth secondary school year (third class) and, in exceptional cases, from those who hold the *brevet d'enseignement industriel probatoire* (industrial certificate), according to the number of vacancies.

It is a 4-year course. The curriculum includes general subjects—French, history, geography, mathematics (arithmetic, algebra, trigonometry and geometry), physics and natural science; technical training—(a) topography (surveying, drawing, land property law), (b) public works technology (roadworks construction, accountancy, strength of materials, drawing, general mechanics, hydraulics, workshop practice, etc.); and physical education.

To be promoted to the class immediately above, pupils must have obtained a satisfactory average for the year (12 out of 12) at the end of the first 2 years, and must have passed the first part of the final examination held at the end of the third year (general subjects and a technical test). The second part of the final examination consists entirely of technical work.

The teaching staff is made up of the following categories: secondary school teachers with qualifying certificate, teachers of technical subjects, public works engineers or engineer surveyors, and assistant teachers of technical subjects.

Agricultural Technical School (collège), *Katibougou.* This school trains 'agricultural leaders', who are responsible for an agricultural sub-section or an agricultural centre. Pupils who obtain the *brevet d'enseignement agricole* (agricultural certificate) (Part II) may take the entrance examinations for the tropical agriculture course (Paris), the *écoles techniques* (Le Havre and Versailles) and the national schools of agriculture (after 2 years' preparation).

The entrance examination for this school at Katibougou is open to holders of a lower secondary certificate, either the *brevet élémentaire* or the *brevet d'études du premier cycle.* The course lasts for 3 years. The curriculum covers general subjects: French, geography, history, arithmetic, algebra, geometry, physics, chemistry, natural science; and technical subjects—agricultural technology, technology of agricultural industries, geology, botany, systematic zoology and physiology, human and animal anatomy, general and specialized agriculture (the study of the different plants), comparative agriculture (different agricultural systems, the study of regions, crop rotation), agricultural implements, horticulture, arboriculture, zootechnics, veterinary science and rural economy.

Supervised work is arranged outside the school, and takes the form of practical training periods (between the second and the third years) in agricultural centres and departments.

To be promoted to the class immediately above, pupils must have obtained a satisfactory average (10 out of 20). Those who do not reach this average are either dismissed from the school or allowed to repeat the year, on the advice of the teachers' council.

Agricultural Apprenticeship Centre (*M'Pessoba*). This centre trains agricultural instructors (*moniteurs*). Each instructor is put in charge of a *centre d'encadrement rural*, a district agricultural centre serving several villages, which has the task of spreading agricultural knowledge among the people. The first five pupils among those who have obtained the vocational proficiency certificate (CAP) in agriculture are allowed, for a transitional period, to attend the Agricultural Technical School.

The competitive entrance examination for the M'Pessoba Centre is open to holders of the primary school certificate. The course lasts for 3 years. The curriculum covers general subjects (the curriculum for classes 6, 5 and 4 and part of the curriculum for class 3 in *lycées*), theoretical technical subjects (general and specialized agriculture, plant husbandry, surveying, agricultural technology, zootechnics, banking, mutual insurance, agricultural co-operatives, etc.) and practical instruction given on farms, designed to teach pupils the elements of agricultural work—how to use implements and machinery. The pupils take part in the farm's activities. Thus, by doing periods of practical training, they learn the principles of organizing and directing agricultural work and acquire a sense of initiative and responsibility.

Sudanese Crafts Centre (*Bamako*). The purpose of this institution is to preserve and restore local applied art techniques. Pupils are selected by examination, or on the basis of qualifications in the case of those who hold a primary school certificate. Adult craftsmen may follow courses without sitting for the examinations. The subjects taught are French, mathematics, drawing and a technical subject—jewellery, weaving and upholstery, ironwork, leatherwork (shoemaking and leather goods), woodwork (cabinet-making and carving). The main emphasis is placed on workshop practice. Every article is hand made by the pupil and bears the imprint of his personality.

Apprenticeship Centre for Railway Rolling Stock and Traction (*Toukoto*). This is a private institution, attached to the Mali Railways Administration. It trains qualified workers for the maintenance of locomotives and rail cars.

Teacher training schools

Ecole normale. The structure of this institution is similar to that of the upper cycle of the *lycée;* pupils are selected by competitive examination and are placed in the second class (fifth year). After passing the *baccalauréat* pupils do a year's vocational training and take the examination for the *certificat de fin d'études normales.*

The *école normale* has the same aims as the *lycée*, but pupils are prepared for work as primary school teachers instead of for higher education. Here, members of the teaching staff have the same qualifications as those in *lycées.* Vocational training is entrusted to a primary school inspector.

Cours normaux. Teacher training courses (*cours normaux*) are at the same level as *cours complémentaires*, and what has been said of the latter applies to the former. The difference between the two is that after 4 years of general post-primary education, leading to the elementary certificate (*brevet élémentaire*), pupils in teacher training courses receive a year of practical training for work as assistant primary school teachers and take the examination for the *certificat de fin d'études des cours normaux.*

Out-of-class activities

The difficulty in this sphere of education is the lack of suitable premises; as the number of pupils grows, less space can be set aside for assembly halls and recreation facilities. This state of affairs, however, is temporary.

There are two film clubs, but owing to the remoteness of Sudan it has not been possible to arrange a satisfactory system of loans and exchanges of films.

Each school has its own library, and there are school sports teams (football, basket-ball and athletics), which are affiliated with the Office du Sport Scolaire et Universitaire (OSSU) (School and University Sports Bureau).

Pupils elect representatives to put their case to the authorities, and in teacher training courses the pupils themselves are partly responsible for class discipline.

TRENDS AND PROBLEMS

The main problems awaiting solution are as follows: to increase the number of places available in the one school providing a full secondary course (the *lycée* at Bamako) and ultimately to establish another *lycée;* gradually to convert the girls' *collège*, which offers a short course, into a *collège* with a full course and subsequently into a *lycée;* to develop the present *cours complémentaires* and establish additional schools of this kind; to provide more places in teacher training courses, in order to meet the growing demand for well qualified primary teachers; to improve technical education, by converting the *collège technique* into a *lycée technique* and adjusting technical education more and more to the country's needs; to develop local arts and crafts through the Sudanese Crafts Centre.

Ideally, too, classes should be smaller, so that the teaching can become more effective and greater attention be devoted to individual pupils. Since the number of pupils is bound to rise, more school buildings and more teachers will be needed.

To solve all these problems will require a substantial outlay, and the Sudanese Government, which is already spending 19 per cent of its budget on education, will be unable to finance it without outside assistance.

The Government of the Republic of Sudan is aware that the development of the country requires qualified staff and workers, trained at general and technical secondary schools; it therefore attaches great importance to all educational questions.

[*Text prepared by the Ministry of Education, Bamako, and transmitted by the French National Commission for Unesco in May 1960.*]

STATISTICS

Population (mid-year 1958 estimate): 3,700,000.
Area: 464,874 square miles; 1,204,021 square kilometres.
Population density: 8 per square mile; 3 per square kilometre.

Summary of school statistics, 1953–57. In 1957/58, the total enrolment of 44,800 pupils represented slightly over 1 per cent of the total population. Nearly 94 per cent of the pupils were receiving primary education. The pupil-teacher ratio was 40 in public primary schools and 16 in public secondary schools. The proportion of girls was 23 per cent in both the primary schools and the secondary schools, but only 5 per cent in vocational education. Between 1953 and 1957, total enrolment increased by 31 per cent. (See Table 3.)

Enrolment trends in secondary education, 1950–57. Total enrolment in secondary education nearly doubled between 1950 and 1957. However, in relation to the estimated population 15–19 years old, the total secondary enrolment ratio remained at less than 1 per cent. (See Table 2.)

Examination results in secondary education, 1953–56. The total number of certificates awarded in 1956 was half as many again as in 1953. There was an increase in each category except the *baccalauréat*, first part. (See Table 4.)

Educational finance, 1958. The 1958 budget of the Sudanese Republic contained 2,639 million French francs for education. With the addition of the 1958/59 allocation from the Investment Fund for Economic and Social Development (FIDES) of about 120 million francs, the total was nearly 2,759 million francs, averaging about 750 francs per inhabitant. Subsidies to private education amounted to about 122 million francs. (See Table 1.)

REPUBLIC OF THE UPPER VOLTA

THE EDUCATIONAL SYSTEM

The educational system in the Upper Volta is based on that of France, with various adjustments relating chiefly to primary school enrolment, the training of primary school teachers, and certain forms of vocational education. The organization of secondary general and technical education is similar to that in France.

Education, culture and research are controlled by the Ministry of National Education of the Government of the Upper Volta Republic. In addition to state schools and institutions, there are private schools and institutions run by the Catholic and Protestant missions; these schools are subsidized by the State, which pays a proportion of the staff salaries.

The nature of the aid and technical assistance furnished by the French Republic to the Upper Volta Republic, and the procedure for providing them, are defined and regulated by: (a) a general Convention of 21 July 1959 'relating to the provision by the French Republic of personnel to assist in the operation of the public services of the Upper Volta Republic'; (b) and an 'annexed Convention on aid and co-operation between the French Republic and the Upper Volta Republic in the educational and cultural fields', the purpose of which is to make available to the Upper Volta such administrative and teaching staff as it may need; to co-ordinate the teaching provided in the schools of the Upper Volta with the teaching provided in those of the French Republic, and to organize in the Upper Volta examinations leading to the acquisition of the diplomas, certificates and qualifications existing in the French Republic.

The principal factors affecting the provision of education have been as follows.

Ethnical. The population of the Upper Volta comprises many races (Bobo, Lobi, Mossi, Gourounsi, Gourmantche, Peuhl), all of them in favour of school attendance; there are thus no special difficulties, except in regard to the unsettled or nomadic Peuhl tribes.

Social. In certain thinly populated areas, school enrolment is difficult because the inhabitants are so widely scattered.

Religious. The first Muslim school in the Upper Volta was opened in 1959; it is a private institution, for boys only. Private schools are comparatively numerous in the areas influenced by the Catholic and Protestant missions, which pay special attention to the education of girls.

The Central Government, through its Ministry of National Education, controls the development of education at the various levels (plans for school enrolment, opening of private schools). It administers, supervises and finances state education and supervises private education, for which it provides grants.

The regional authorities (at the level of the *cercles*) participate, in co-operation with the central administration, in the enrolment of pupils and the construction and upkeep of school buildings (paid for out of the *taxes de cercle*) and exercises administrative supervision over the teaching staff.

The local communities sometimes contribute to the construction of school buildings.

Parents' associations help to improve the conditions in which the schools operate, while youth movements and sports and cultural associations carry out educational work in liaison with the schools.

THE DEVELOPMENT OF SECONDARY EDUCATION

Until 1950, secondary education was controlled by a Directorate-General of Public Education, with headquarters at Dakar, which was responsible to the Ministry for Overseas France and the Ministry of National Education of the French Republic.

An education office (*académie*) for French West Africa was instituted by the Decree of 27 November 1950. This provided for a *Recteur*, appointed by inter-ministerial decree (Ministries for Overseas France and National Education) to take charge of education under the authority of the High Commissioner of the French Republic in French West Africa.

Under the *Loi-cadre* of 23 June 1956 and the Decrees of 4 April 1957 relating to the new institutions in French West Africa, important powers were conferred upon the governments of the territories composing the French West African group. The *académie* of French West Africa continued to exist, but by an Order of the High Commissioner of the Republic, dated 26 December 1957, it was transformed into a service operated jointly by the French West African Territories and responsible for the co-ordination of education, culture, etc., throughout those territories. The *Recteur* was at the head of this joint service, and was assisted by various advisory councils and technical services, while each of the territories had an *Inspecteur d'Académie* who acted as head of the Territorial Education Service, and was appointed by the Chief of the Territory in consultation with his Government Council.

In 1958, all the powers of the *Recteur* of Dakar *Académie* in the field of secondary education were transferred to the Government of the Upper Volta.

It should, however, be noted that the *baccalauréat* examination, which concludes the classical and modern secondary school courses, and higher education are under the authority of the *Communauté*.

Legal basis

In secondary education the Government of the Upper Volta applies the laws in force in the French Republic with regard to the classification of schools, qualification of staff, organization of teaching and administration, curricula, time-tables, school attendance and certificates.

Administration

Secondary education is planned and organized by the Government of the Upper Volta, acting on the proposals of the Minister of National Education, assisted by an *Inspecteur d'Académie*, on secondment from France, who acts as Director of Education, by the Council of Heads of Schools, and the management boards of the various schools.

On questions of technical and vocational education, the Minister is assisted by an advisory council, which also gives advice on employment problems.

The Ministry of Education exercises authority and control over secondary schools through the Director of Education, who is the immediate superior of the heads of schools. It is also through the Director that the Minister exercises general control over private schools.

Inspection is carried out entirely by civil servants with authority to inspect and assess the administrative and teaching staff of schools. These officials comprise, in addition to the Director of Education, inspectors-general of public education of the French Republic, sent on missions of inspection at the request of the Upper Volta Government, primary school inspectors, responsible for supervising primary school teachers seconded to secondary schools, and an inspector who supervises physical training and sports activities in the schools.

Finance. The running expenses of secondary schools are met from the state budget. Appropriations are made for each school. Accounts for expenditure undertaken by the schools are paid by the government's financial services. The only money actually handled by the schools is the petty cash account (a fund exists in each school to provide advances).

From 1948 to 1949 the construction of secondary schools was financed by a special fund set up by the Government of the French Republic—the Investment Fund for Economic and Social Development (FIDES). Since the French Community came into being, this agency's name has been changed to Assistance and Co-operation Fund (FAC). Another source of finance is the European Development Fund for Overseas Countries and Territories (FEDOM, set up by the European Economic Community.

Local teachers in state schools are paid out of the state budget, while since 1 January 1960, technical assistance personnel have been paid entirely out of the Budget of the French Republic (Secretariat of State for Relations with the States of the *Communauté*). Private schools receive state grants for the payment of teachers' salaries. No fees are paid by day pupils in the state schools.

Living expenses of scholarship holders in secondary schools are defrayed by the State. The cost of this in 1959 amounted to 150 million C.F.A. francs (or one-sixth of the National Education budget).

Buildings and welfare services. The buildings are of various types. The average accommodation is as follows: classrooms, 1.50 square metres per pupil; dormitories, 3.50 square metres per pupil.

Every school has an infirmary, with a sick room for minor cases, a first-aid room, and an isolation ward for contagious cases. Medical inspection is entrusted to school medical inspectors, who are responsible to the Ministry of Health.

TYPES OF SECONDARY EDUCATION

General secondary education comprises a long and a short course of study.

The long course (*enseignement long*) covers 7 years, the first 4 of which (first cycle) lead to the lower secondary school certificate (*brevet d'études du premier cycle* or BEPC), and the following 3 years (second cycle) to the different *baccalauréats*. The long course offers a choice between classical studies, where literature predominates and the curriculum includes Latin, with Greek as an optional subject, and modern studies, which provide a more balanced education including both literature and science, and where the study of the classical languages is replaced by that of a second modern language and more time is given to mathematics and science.

The short course (*enseignement court*) is a modern course, lasting 4 years and leading to the BEPC or the elementary certificate (*brevet élémentaire* or BE).

Technical education is represented in the Upper Volta chiefly by *centres d'apprentissage*, vocational training institutions where the course leads, as in France, to a vocational proficiency certificate (*certificat d'aptitude professionnel* or CAP); these centres include commercial and industrial sections. The creation of a *collège technique* where pupils will be able to study for technical certificates or technical *baccalauréats* is now being studied.

After the entrance examinations to the secondary schools, a vocational guidance committee makes proposals for the future of the pupils on the basis of their school records and the results they have obtained in these examinations. These proposals are transmitted to the pupils' families, to assist them in selecting a branch of study.

Moreover, during the first term of the first year the work is specially organized so as to help the teachers to discover the aptitudes of the pupils. At the end of this observation period further proposals are made to the families if this is deemed advisable. Advice of this nature may also be given at the end of the first, second and fourth years of study should a change of direction seem desirable.

The *baccalauréat*, followed by one year of teacher training, serves as a qualification for primary teaching and also gives admission to institutions of higher education. At present the Upper Volta has no establishments at this level, with the exception of the National College of Administration, but African students are admitted to French universities, specialized schools and institutes.

Organization of the school year

The school year lasts 9 months. The opening date is between 1 and 15 October, and the closing date between 1 and 13 July.

The year is divided into three terms, separated by two short holiday periods (8 to 10 days), the first of which covers Christmas and New Year, while the second falls at Easter.

The principal classes are held in the morning, between 7 a.m. and noon, the afternoon being usually reserved, after a siesta from 1 to 3 p.m., for practical work, supervised activity and occupations requiring less mental concentration. Physical training is given during the coolest part of the day, in the early morning or late afternoon. Thursday afternoon and Sunday are holidays.

General secondary schools

The admission of pupils to the various types of secondary school is governed by the results of a selective examination aimed at ascertaining the level of the candidates' general knowledge (completion of primary school studies) and their capacity to benefit by secondary school teaching. Candidates must be 11 years of age, though a margin of one year in either direction is sometimes allowed.

The types of school are: (a) *lycées* and *collèges* (general secondary schools maintained by public authorities, the similar private institutions being known as *cours secondaires*). These schools provide the long course and draw their pupils from all parts of the territory of the Republic. (b) *Cours complémentaires.* These, of which it is proposed to open a certain number at the beginning of the 1960 school year, will give a short modern course, comprising a general section leading to the lower secondary school certificate (BEPC), and possibly agricultural, commercial and other sections, corresponding to local needs and employment facilities. Pupils will be accepted only from the area surrounding each school.

The following table gives examples of the way in which the weekly time-table is divided between the subjects in the curriculum of the *lycées* and *collèges.*

WEEKLY TIME-TABLES OF FOURTH AND FIRST CLASSES OF 'LYCÉES' AND 'COLLÈGES'

(in hours per week)

Subject	First cycle—3rd year of study (4th class)		Second cycle—6th year of study (1st class)[1]	
	Classical	Modern	Classical (B)	Modern (M')
French	3½	5½	4	4
Latin	3½	—	3	—
Citizenship teaching	½	½	—	—
Modern language I (English)	3	3	3	3
Modern language II (Spanish)	3	4	4	2[2]
History and geography	2½	2½	3½	3½
Mathematics	3	3	1½	4
Observation science	1½	1½	—	—
Physical sciences	—	—	2¼	4½
Natural sciences	—	—	—	3
Drawing	1	1	1	1
Musical education	1	1	1[2]	1[2]
Handicrafts	1	1	1[2]	1[2]
Physical training	2	2	2	2
Total	25½	25	26¼[3]	29[4]

1. Preparing for the first part of the *baccalauréat.*
2. Optional.
3. Two of which are optional.
4. Four of which are optional.

The teaching methods employed in the Upper Volta are those recommended in the Instructions of the Ministry of National Education for the different subjects concerned. Considerable prominence is given, particularly in scientific teaching, to inductive and active methods based on observation and experiment.

An average of 90 per cent of pupils are promoted to higher classes each year; about 70 per cent of the pupils enrolled for the first year of the primary course complete that course. The percentage eliminated is approximately the same in the second cycle, and 50 per cent of the pupils admitted to general secondary schools eventually sit for the *baccalauréat.*

Teaching staff in the general secondary schools is almost entirely European. It comprises: (a) civil servants from the Ministry of National Education of the French Republic, made available to the Upper Volta Government under the heading of technical assistance (teachers holding an *agrégation*, a *certificat* or a *licence*, assistant teachers holding a *licence*, and junior teachers with no *licence*). Their career follows the same lines as those of the group of officials in metropolitan France from which they have been seconded; (b) personnel under contract, recruited in France or other States of the *Communauté* who hold a teaching *licence*, higher educational certificates, or an engineering diploma (for mathematics and science). Many of these have considerable teaching experience, but they are not established civil servants making their career in this branch.

Vocational and technical schools

Apprenticeship Centre. This is a state school, providing: (a) a full-time study cycle, either in the industrial sections, which give a 3-year course leading to a vocational proficiency certificate (*certificat d'aptitude professionnelle* or CAP) in some branch of the building trade (mason, carpenter or locksmith) or the car repair industry (auto mechanic) or a 4- or 5-year course in the commercial sections, leading to the CAP in book-keeping, office work or shorthand and typing; (b) evening classes for in-service vocational training (shorthand, typing, book-keeping, industrial draughtsmanship, auto mechanics).

Pupils in the industrial sections must pass an entrance examination designed to determine their general knowledge (primary school certificate) and their aptitude for manual work. Candidates must be between 14 and 18 years of age. Pupils in the commercial sections must pass the examination for admission to the first-year class of a *lycée* or *collège.*

The final choice of course for pupils in the industrial sections is made at the end of a trial period lasting 3 months, during which the pupil spends a period in each of the different workshops. The subjects taught in these sections are those of the apprenticeship centres in France. Contact with industrial and commercial firms is established at meetings of the school's administrative board, at which such firms are represented.

The evening courses are intended for those who are already in employment and wish to improve their qualifications.

Centre for intensified training in the building industry. This centre trains masons (1-year course). Candidates must pass

a general knowledge examination. The subjects taught are bricklaying, the use of reinforced concrete, and draughtsmanship.

Private establishments. There are private establishments for boys which provide industrial training similar to that given in the industrial sections of the apprenticeship centres; there are also establishments providing training in rural handicrafts of a practical nature adapted to the environment.

For girls there are domestic training schools with a 4-year course leading to the CAP in domestic arts. The curriculum includes general subjects (French, arithmetic, history and geography, citizenship and law), together with theoretical and practical vocational training (domestic economy, hygiene and child-care, housekeeping and dressmaking).

Agricultural Apprenticeship Centre (Ministry of Agriculture). Candidates must take a competitive examination (equivalent to the primary school certificate). At the end of the 3-year course a certificate in agriculture may be obtained which qualifies for employment as an agricultural monitor. The general education gives prominence to the physical and natural sciences, while the theoretical and practical vocational training includes general and specialized agriculture, horticulture, plant conservation, zootechnics, mechanization of agriculture, topography, credit institutions and co-operatives, and agricultural crafts.

The school is directed by an agricultural engineer, assisted by secondary school teachers and agricultural technical assistants.

Forestry School of the Upper Volta (Ministry of Animal Husbandry and Forestry). Admission is by competitive examination (level of primary school certificate). Candidates must have completed their military service. The course lasts 1 year and comprises general subjects (French, arithmetic), theoretical study (botany, zoology, geology, arboriculture, the economics of forestry, forestry law, topography) and practical training (arboriculture, pisciculture, mechanics, agricultural mechanization, fieldwork).

The school trains forestry officials (superintendents). It is directed by an engineer from the Forestry Department.

School of Veterinary Assistants (Ministry of Animal Husbandry and Forestry). Admission is by a competitive examination (level of primary school certificate). Candidates must be between 17 and 22 years of age. The course lasts 1 year, and is exclusively vocational. It comprises theoretical studies (histology, physiology, contagious and non-contagious pathology, therapeutics and pharmacy, zootechnics, parasitology, products of animal origin) and practical training (clinical and minor surgical work, supervision of slaughtering). At the end of the course, a veterinary assistant's diploma may be obtained, which qualifies for posts in the Animal Husbandry Department. The school is directed by a veterinary surgeon assisted by technicians.

The 'Centre Muraz' School for Male Nurses (Ministry of Public Health). This inter-state school, directed by a medical officer of the Military Health Service, trains subordinate staff for the campaign against sleeping sickness. Admission is by competitive examination (level of primary school certificate). Candidates must be between 16 and 25 years of age. The course lasts 2 years.

School for Male and Female Nurses of the African Medical Service (Ministry of Public Health). Admission is by competitive examination (level of primary school certificate). Candidates must be between 16 and 25 years of age. A selection is made on the basis of a test held at the end of the first 3 months.

The curriculum (covering 2 years) comprises anatomy, hygiene, medicine and minor surgery, ophthalmology, and for girls, child care, gynaecology, obstetrics and pediatrics. The students spend periods of practical training in hospital centres. On passing out they receive the nursing diploma of the Medical Service.

The school is directed by a doctor of medicine assisted by women nurses holding state diplomas and monitresses holding the nursing diploma of the African Medical Service.

School for Women Social Assistants (Ministry of Social Affairs, Housing and Labour). Admission is by competitive examination (level of the fourth secondary school year). Candidates must be between 16 and 21 years of age.

The curriculum (2 years of study) comprises general education, the study of labour legislation, and practical training; it consists of 1 year of health training (a period of practical training at the school of nursing) and 1 year of social welfare training (domestic economy, child-care, household activities). On passing out, students receive the social worker's diploma. The school is directed by a woman social worker holding the state diploma.

Teacher training schools

The Upper Volta has no schools corresponding to the French *écoles normales*. The setting up of a school of this type is under consideration.

Primary school teachers are trained at junior teacher training courses (*cours normaux*), at lower secondary level. The period of study is 5 years, comprising 4 years of general education, leading to the *brevet élémentaire*, and a fifth year of teacher training divided between theory (general and special pedagogy, school legislation and professional ethics, supplementary general education) and practical work (periods in practice schools and 4 months as a trainee in a state school; specialized courses of physical training, adult education and, for girls, social welfare training).

The entrance examination is the same as that for admission to the *lycées* and *collèges*. Boys must be between 13 and 15 and girls between 13 and 16 years of age. Pupils receive state scholarships and undertake to work as teachers for a period of not less than 10 years.

The director and teachers are recruited from the teaching staff of *cours complémentaires* in France and are thus seconded civil servants; they are assisted, in some cases, by young African secondary school teachers, holders of the *baccalauréat*, who come to them for a course of training.

Other specialized schools

African Preparatory Military School. This school prepares pupils for the training schools for African non-commissioned officers. It comprises classes equivalent to the final primary classes and the early secondary classes. Admission is by competitive examination. The school comes under the authority of the Military Commandant of the Upper Volta, and is directed by an army officer, with the assistance of a post-primary teacher for the organization of studies.

Out-of-class activities

In the secondary schools various responsibilities are entrusted to the pupils, for educational reasons; some are class monitors (*chefs de classe*), responsible for order and discipline, others act as librarians, or are responsible for the tidiness of the school premises, or for giving first-aid. In suitable cases, these pupils are admitted to meetings of the staff council. In each school the pupils form sports clubs affiliated to the Office of School and University Sports.

TRENDS AND PROBLEMS

There are at present four basic problems:

1. The psychological and social problem caused by the uprooting of pupils from their homes, which may lead to a break with the original family and social environment. The remedy might be to decentralize secondary education by opening schools smaller than the *lycées* and *collèges*, with pupils drawn from a restricted area. This consideration has prompted the forthcoming opening of *cours complémentaires* (establishments corresponding to the first secondary school cycle).
2. The social problem of finding employment for pupils who leave school before completing their studies. Some of these, but only a few, are sent to the training schools for subordinate technical posts in the Health, Animal Husbandry, Agriculture and Forestry Departments. A similar problem arises in finding employment for pupils who complete their vocational training at the Apprenticeship Centre. Owing to the backwardness of industrial development in the Upper Volta, only a small number of these pupils can find work bearing some relation to the qualifications they have acquired. Studies are in progress with a view to co-ordinating the programme for the extension of education and the plans for economic development.
3. The social and educational problem of adapting the curricula more completely to African life and to the country's economic circumstances.
4. Lastly, there is the problem of training African staff. Assistance provided by the French Republic includes the organization in France of training courses for African teachers, inspectors and educational administrators.

[*Text prepared by the Ministry of National Education, Ougadougou, and transmitted by the French National Commission for Unesco in May 1960.*]

STATISTICS

Population (mid-year 1958 estimate): 3,736,000.
Area: 105,839 square miles; 274,122 square kilometres.
Population density: 35 per square mile; 14 per square kilometre.

Summary of school statistics, 1955–59. In 1959/60, there were 43,549 pupils enrolled in all schools, not including some 3,000 persons attending adult classes in primary schools. This means a school-going population of slightly over 1 per cent of the total population. Girls were 28 per cent of the primary school enrolment and 30 per cent of the secondary enrolment. The average number of pupils per teacher was 42 in primary schools and 20 in secondary schools. Between 1955 and 1959, primary school enrolment increased by two-thirds and secondary enrolment more than doubled. (See Table 1.).

Enrolment trends in secondary education, 1950–59. Enrolment in general secondary schools in 1959 was nearly four times as high as in 1950. Vocational school enrolment increased even more rapidly from 89 pupils in 1950 to 506 in 1959. Average total secondary enrolment for the period 1955–59 was less than 0.5 per cent of the estimated population 15–19 years old.

Examination results in secondary education, 1953–57. The number of lower secondary certificates (BE and BEPC) granted in 1957 was two and a half times as high as in 1953. There was also a rapid increase in the number of pupils passing the two parts of the baccalaureat, although only one girl passed the first part in 1956 and one in 1957. The number of vocational certificates (CAP) sharply declined after 1955/56. (See Table 2.)

Educational finance, 1959. The education budget for the fiscal year beginning in January 1959 amounted to 1,148.5 million C.F.A. francs (including the allocation from the Investment Fund for Economic and Social Development (FIDES), as well as other revenues), which represented an average expenditure of about 300 francs per inhabitant. (See Table 3.)

FEDERAL REPUBLIC OF GERMANY AND WEST BERLIN

The use of the term 'secondary education' (*weiterführendes Schulwesen*) to denote all forms of education following the conclusion of basic primary schooling (*Grundschule*) has not yet been universally accepted in the Federal Republic of Germany. The continuation, in three different types of schools, senior primary (*Volksschuloberstufe*), intermediate (*Mittelschule* or *Realschule*), and high school (*höhere Schule* or *Gymnasium*) of the 4- or 6-year *Grundschule* course is still often regarded as a vertical division of the educational system into three independent branches—popular, practical and theoretical, and academic—differing in length and standard. Since, however, compulsory education for everyone from 6 to 18 years of age, without exception, was established as a principle in 1919 (Weimar Constitution), was enforced, with certain restrictions, by the *Reichsschulpflichtgesetz* (Reich Compulsory Education Law) from 1938 onwards, and has been fully applied since 1945 as a result of laws passed by the *Länder*, and since the length of the course in all three branches is roughly the same, it is gradually being realized that, despite all their differences, they represent a unified stage in education. This applies particularly since the weekly hours of school work for more than 2 million boys and girls in the part-time vocational schools (*Berufsschulen*) have begun to go up from 6 to 8, to 10 or even 12, and the number of supplementary advanced courses and full-time vocational schools (*Berufsfachschulen*) has been increasing rapidly.

The senior departments of primary schools (*Volksschuloberstufen*), which take pupils who have completed the first 4 or 6 years of primary studies and keep them up to the age of 14 or 15, should logically be included in a description of secondary education, but as they have already been dealt with in the preceding volume[1] they are omitted from this report. The advanced full-time technical or vocational school (*Fachschule*) which begins at the end of the *Mittelschule*, *Berufsfachschule* or *Berufsschule* must also be counted as secondary education, although some of these schools, notably the schools of engineering (*Ingenieurschulen*), come close to the university level. On the other hand, the training of teachers for primary, intermediate and vocational schools, as well as for academic high schools (*Gymnasien*), comes under the heading of higher education since, in the Federal Republic, completion of studies at a secondary school is a prerequisite for admission to any kind of teacher training.

'Secondary' education in the statement which follows will thus cover: (a) general education provided in inter-

1. *World Survey of Education: II—Primary Education*, Paris, Unesco, 1958.

mediate schools (*Mittelschulen* and *Realschulen*), and in academic high schools (*Gymnasien*); (b) vocational education up to the school leaving age, provided by the part-time *Berufsschulen* and the full-time *Berufsfachschulen;* and (c) vocational education beyond the period of compulsory education in the full-time *Fachschulen.*

THE EDUCATIONAL SYSTEM

Under Article 146 of the Constitution of the German Reich of 11 August 1919, access to every form of secondary education was guaranteed to all young people, without distinction of race, social status or religion.

The Basic Law of the Federal Republic of Germany, dated 8 and 24 May 1949, contains only one sentence dealing with the subject of education (Article 7, paragraph 1): 'The whole school system is under the supervision of the State'. The 11 member States (*Länder*) of the Federal Republic have therefore re-stated in their constitutions and educational laws that all young people have an equal right to education according to their intellectual abilities, and that all schools, both public and private, are subject to state approval and supervision. There is no Federal Ministry of Education. Each individual *Land* is responsible for its own educational system. A voluntary confederation of the Ministers of Education of the *Länder*, known as the Standing Conference of Ministers of Education (*Ständige Konferenz der Kultusminister*) in Bonn, endeavours to ensure that education, throughout the Federal Republic, develops at an even rate.

In the various divisions of the *Länder*, the educational departments of the District Presidents (*Regierungspräsidenten*), on behalf of the Minister of Education, are responsible for the local supervision of schools. District and local community authorities (*Kreise* and *Gemeinden*) play their part, as specified by law, in the organization and administration of secondary education. Private organizations which, in accordance with the requirements of the legislation governing private education, maintain their own schools, have power of decision in matters affecting the external affairs and administration of their schools, but here, as well as more particularly in the matter of internal affairs, are subject to the supervision of the state educational authorities.

The structure of the school system is shown in the diagram on page 569.

THE DEVELOPMENT OF SECONDARY EDUCATION

At the beginning of the twentieth century, there were four separate school systems in Germany: the 8-year primary school course (*Volksschule*), the 9-year intermediate school course (*Mittelschule*) provided either in an independent 9-class school or in a 5-class school based on 4 years of primary schooling, the 10-year girls' high school (*höhere Mädchenschule*), also either an independent 10-class school or organized as a 6-class school based on the fourth primary school class, and the 9-year academic high school course (*Gymnasium*), which began after 4 years of primary schooling and consisted of 9 classes (making 13 years in all) or started off with 3 preparatory school classes of its own (making 12 years in all).

The decisive move towards bringing into being a uniform educational system took place, as already stated, with the Constitution of the German Reich (*Verfassung des Deutschen Reiches*) of 11 August 1919, which provided for compulsory schooling for all up to 18 years of age; a basic primary school course (*Grundschule*) which was compulsory and the same for all; and, for pupils having completed 8 years of primary schooling and embarking on a practical career, attendance at a continuation school until the end of the period of compulsory schooling. Since then, the system of separate, parallel courses of study, or 'isolation system' (*Isolationssystem*) has changed into a 'branched system' (*Gabelungssystem*), in which the *Grundschule* is the common stem, ramifying, at the stage of secondary education, into the senior primary school course, together with part-time or full-time attendance at a vocational school; the intermediate school course; and the academic high school course.

After the *Grundschule* had been established throughout the country by the Federal Law of 28 April 1920, no national regulations concerning the organization of the next stage in education were issued; the matter was left

GLOSSARY

Berufsfachschule: full-time vocational secondary school.

Berufsschule: part-time vocational school offering 6 to 12 hours per week of schooling; attendance is compulsory for all young people under 18 years of age who are not enrolled in some other type of school.

Fachhochschulen: specialized colleges (higher education level) at which instruction is given in only one or two branches of learning, e.g. commerce, economics, agriculture and forestry, etc.

Fachschulen: advanced full-time vocational training schools.

Gymnasium: general secondary school differentiated by curriculum and length of course, but in every case preparing for higher education.

Gymnasium altsprachig: course includes Latin, Greek, and one modern language.

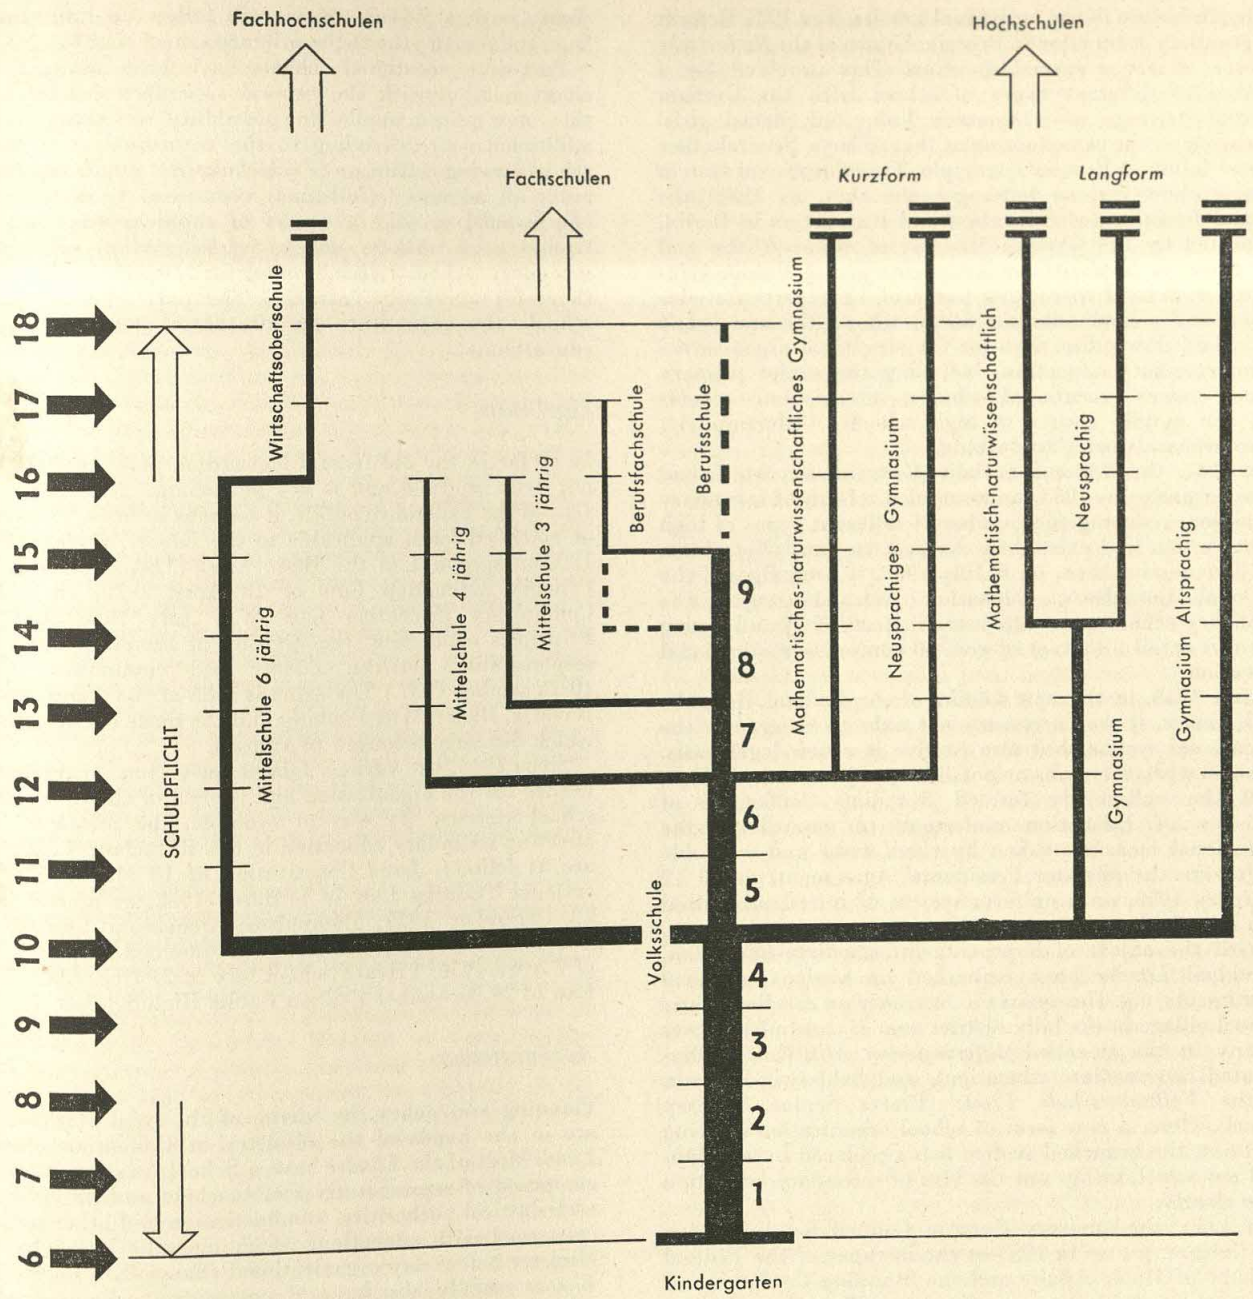
Gymnasium mathematisch-naturwissenschaftlich: course including two foreign languages and emphasizing instruction in mathematics and science.

Gymnasium neusprachig: course includes Latin and two modern languages.

Kurzform: the 'short form' of *Gymnasium* (6–7 years).

Langform: the 'long form' of *Gymnasium* (9 years).

Hochschulen: institutions of higher academic and professional education.



Kindergarten: pre-primary school.

Mittelschule: general secondary school, with varying length of course, viz. 3, 4, or 6 years.

Schulpflicht: compulsory education period, which begins when the child turns 6 and continues to the age of 18.

Volksschule: primary school.

Wirtschaftsoberschule: commercial college.

to the discretion of the individual *Länder*. The 1925 Reform of Secondary Education in Prussia, known as the *Richertsche Reform*, deserves special mention. This provided for a number of different types of school with the German cultural heritage as a common link, and placed girls' education on the same footing as that of boys. Several other *Länder* followed Prussia's example. The educational system became, however, so heterogeneous that, in 1931, the Central Institute for Education and Instruction in Berlin, supported by the German Ministry of Home Affairs and the Prussian Ministry for Art, Science and Public Education, convened a working party of 15 experts on education and school administration, who, after one year's work, laid down directives for the structural organization of intermediate education, including the senior primary school classes, vocational schools, intermediate schools and the middle classes of high schools. Unfortunately, these proposals came to nothing.

In 1937, the National Socialist Government, which had come to power in 1933, announced a reform of secondary education, reducing the number of different types of high school which had existed in the past to two: *Oberschulen* and *Gymnasien;* then, on 6 July 1938, it promulgated the National Comulsory Education Act, shortening the secondary school course (8 years instead of 9) and laying down in detail a system of general compulsory vocational education.

After 1945, in the new *Länder* of the Federal Republic of Germany, it was necessary not only to reorganize the educational system, but also to give it a new legal basis. To begin with, there was no possibility of joint consultation, until the voluntarily formed Standing Conference of Ministers of Education undertook to co-ordinate the educational measures taken by the *Länder* and was able to prepare the Minister Presidents' Agreement, dated 17 February 1955, on a uniform system of intermediate and high school education.

With the object of improving intermediate education, individual *Länder* have embarked on various practical experiments, e.g. Hessen in the *Schuldorf an der Bergstrasse* (School village in the hilly district near Darmstadt), Lower Saxony in the so-called *differenzierten Mittelbau* (differentiated intermediate education), and Schleswig-Holstein in the *Volksoberschule Preetz* (Preetz Senior Primary School). Here, a new form of school organization is being tried out, the branched system being replaced by a graduated one which brings out the idea of secondary education more clearly.

In 1959, the advisory German Council for Education and Culture, set up in 1954 at the instance of the Federal Ministry of Home Affairs and the Standing Conference of Ministers of Education, outlined a 'Plan for the Reorganization and Unification of General Public Schools'. According to this plan (which excludes vocational schools), the four junior primary school classes are to be followed by a 2-year vocational guidance course, known as the 'transition course' (*Förderungsstufe*), which will serve as a preparation for the *Hauptschule* (senior primary school), *Realschule* (intermediate school) and 7-year *Gymnasium* (general high school), which are to be treated as secondary schools with different curricula and courses of varying lengths, whereas the classical academic high school (*altsprachliches Gymnasium*), with a 9-year course, will follow on immediately from the fourth year of the primary school course.

Part-time vocational schools have been brought into closer relation with the general secondary schools since they now afford pupils the possibility of taking certain additional courses leading to the vocational or technical school leaving certificate (*Fachschulreife*); pupils can either enter an advanced (full-time) vocational training school (*Fachschule*) or take a course of supplementary general studies at a workers' college (*Arbeiterkolleg*) or evening secondary school (*Abendgymnasium*), which will qualify them for university entrance. The part-time vocational schools thus constitute an alternative route to higher education.

Legal basis

In so far as the old federal legislation, prior to 1945, has not been repealed and is not at variance with the Basic Law of the Federal Republic, it remains in force, in original or amended form, applicable to the *Länder*, under Article 122, paragraph 1 of the Basic Law. (This applies to the Primary Education Law of 28 April 1920, the Reich Compulsory Education Law of 6 July 1938, and the Principles concerning the division of financial and fiscal responsibility between *Länder* and communes, dated 10 December 1937.) The same is true of the *Land* laws in Bavaria, Baden-Württemberg and the parts of the country which formerly belonged to Prussia.

Since 1945, the various *Länder* have enacted legislation needed for the organization and control of their respective school systems. By way of example, the principal laws affecting secondary education in the Rhineland Palatinate are as follows: *Land* Constitution of 18 May 1947; Vocational Training Law of 3 March 1952, as amended on 22 December 1955; Compulsory Schooling Law of 22 December 1955; Law on Division of Financial Responsibility of 7 April 1956; Private School Law of 21 December 1957; Law of 25 November 1958 on Public High Schools.

Administration

Planning and policy, by virtue of the legal stipulations, are in the hands of the Ministry of Education of each *Land*. Most of the *Länder* have a School Advisory Council, composed of representatives of teachers and parents, the ecclesiastical authorities, administration and other persons concerned with education, which must be heard by the Minister before any organizational changes are made. The *Länder* usually also have a representative committee of the various parents' advisory boards. The curricula of the individual schools are drawn up by the teaching staff on the basis of directives worked out by the Ministry, in cooperation with teachers and parents. Teachers are free to choose their own method of teaching, but this must be based on sound educational principles and must achieve the desired results. Before school books are introduced they must be submitted for approval to the Textbooks Committee of the Ministry; they are then entered in the official list of textbooks from which the various schools can make their choice.

Control. In public and private schools alike, the control of education is in the hands of specially trained officials of the state educational authorities. According to the size of the *Land*, control may be exercised at three levels, two levels or only one level. In Baden-Württemberg, Bavaria, Lower Saxony, North Rhine-Westphalia, the Rhineland Palatinate and the Saar, there is control at three levels. At the lowest level, in the *Kreis* (local administrative district), or municipality, the local education officer (*Schulrat*) is responsible for the administration of both primary and intermediate schools. Control at the next level is the responsibility of the Schools Department (*Schulabteilung*) of the Office of the District President (*Regierungspräsident*); in Baden-Württemberg, this department is known as the *Oberschulamt*. Officials of varying rank (*Oberregierungsräte* and *Schulräte*) from the Schools Department supervise the *Kreis* and municipal education offices (*Kreis- und Stadtschulämter*), the part-time and full-time vocational schools and sometimes the advanced full-time vocational schools; in certain *Länder* (Baden-Württemberg, Lower Saxony and Hessen) they also supervise the high schools. The Ministry, in its turn, exercises general control over all the aforesaid schools and, in the Rhineland Palatinate and the Saar, itself supervises the *Gymnasien*. In North Rhine-Westphalia and parts of Lower Saxony, the Ministry has set up a special board (*Aufsichtsbehörde*)—known as the *Schulkollegium* in North Rhine-Westphalia—to supervise *Gymnasien*. In Bavaria, certain powers of secondary school supervision are delegated to the ministry's regional commissioners. In Hessen, there is no school supervision machinery at the lowest, i.e., the local, level; in Schleswig-Holstein, there is none at the intermediate level. Berlin, Bremen and Hamburg have only one system for the control of education.

The legal and educational control of all types of school is thus the direct or indirect responsibility of the Ministry (or, in Berlin, Bremen and Hamburg, of the Senator for Public Education or for Schools and Education). In some *Länder*, however, agricultural schools are supervised by the Ministry of Agriculture, or jointly by the Ministries of Agriculture and Education. Because of their special requirements, mining schools (part-time vocational, preparatory and technical) come under the authority of the Mines Commissions, which are administrative departments of the *Land* Ministries for Economic Affairs.

So far as the State exercises control over schools, the decisions and measures which it takes are subject to examination by the judiciary.

It was already stipulated in the Weimar Constitution of 1919 that the State can delegate a share in the supervision of schools to the communes. This it has since done in two different ways. School offices may be set up by the administrative authorities of the various *Kreise*, in which the elected leader of the *Kreis* works with the state education officer on the basis of shared responsibility for external and internal school affairs, or alternatively the head of a municipal school office, or his professional colleagues, may be commissioned by the State to take over the duties of a state education officer. These cover the control of primary and intermediate schools only, however, not that of vocational schools and high schools (*Gymnasien*).

Inspection. Responsibility for inspecting education devolves upon educational officials who have been trained as teachers. They are selected from the ranks of serving teachers, the chief inspector recommending headmasters or outstandingly good teachers of the district who have proved their capacity for leadership. They are examined by senior inspectors and placed on a list, from which candidates are chosen as vacancies occur; they are then appointed on probation, being finally appointed when their services have proved satisfactory over a given period of time. No special academic training is stipulated, but increasing importance is attached to the fact that a candidate for promotion should have improved his qualifications by following courses and should have given proof, by scholarly publications, of his academic suitability for a post in the school inspection service.

Finance. Education is financed out of general tax receipts, not from special education taxes. School costs are shared by the State and those who run the schools (*Schulträger*), that is, any corporate body, organization or private person legally responsible for establishing and maintaining a school. The maintenance of schools may be on a separate or on a joint basis. In the case of 'separate' maintenance, the *Schulträger* has sole financial responsibility for the schools which it runs, even if the State makes a grant-in-aid. When maintenance is on a joint basis, which is becoming more and more common, staff costs (salaries, pensions, etc.) are borne by the State and material costs (school buildings, classroom equipment, etc.) by those who run the school. Each party, however, assists the other—the school managers the State in paying the teachers' salaries, and the State the school managers in meeting the material costs, for example, when money is required for new school premises, to meet a deficit in school funds due to the abolition of school fees, or for the provision of free school materials. The regulations differ from one *Land* to another. Intermediate, high school, vocational and technical education are already free in almost all the *Länder;* textbooks are also supplied free of charge in nearly all. Parents with small incomes are eligible for education grants on behalf of children attending high schools, provided that the latter's performance and natural ability warrant such assistance.

Buildings and equipment. Official directives governing school buildings are issued in each of the *Länder*. They provide for at least 2 square metres of floor space per pupil in the classrooms, proper ventilation, adequate daylight and artificial light, and appropriate sanitary arrangements. In secondary schools, provision is made, in addition, for the necessary workshops, laboratories and collection rooms, a gymnasium with changing-rooms, etc. and, if possible, a swimming pool, a playing field or sports ground, and a school playground allowing at least 3–5 square metres of space per pupil. If the State is to give a building grant, the building plans of the school managers must be submitted to the education authorities for examination and approval.

School welfare services. These include the school medical service, school excursions and holiday trips, the prevention

of accidents through school instructions and road security lessons, etc. For most of these activities, parents' and pupils' representatives work in co-operation with the school authorities. The provision of school meals, which had to be organized in the first years following the war, has now, with the return to normal living conditions, been confined to the supply of morning milk, particularly as the system of tuition for half the day only makes it superfluous to provide a larger meal.

TYPES OF SECONDARY EDUCATION

The time at which pupils change over to secondary education varies according to their aptitudes and particular gifts; it may be at the end of the fourth, sixth or seventh year in the case of a general secondary school (*Gymnasium* or *Mittelschule*), or at the end of the eighth or ninth year in that of a vocational secondary school (part-time *Berufsschule* or full-time *Berufsfachschule*). The earlier this changeover occurs, the more necessary it is for parents and teachers to consult. This is done at the weekly consultation hours which the teachers set aside for parents. In particularly difficult cases, the services of a specially trained school psychologist are available in many individual schools or in the larger educational centres. Before pupils embark upon practical training and enter the appropriate vocational school, specialized vocational guidance experts give talks on requirements and prospects in the various careers and, if parents so desire, give the children an aptitude test. The same is done for pupils at intermediate schools and *Gymnasien* before they complete their school education. Pupils attending vocational schools can, by following supplementary courses, qualify for admission to full-time advanced vocational or technical schools and, if their performance there is good, or if they take a course at a workers' college or at an evening secondary school, they may then go on to a university (the so-called 'second path' to higher education).

The Easter holidays, lasting about 3 weeks, mark the end of one school year and the beginning of the next. Only in Bavaria does the school year end in mid-July, the next beginning, after a 6 weeks' summer holiday, in September.

General secondary schools

The general secondary schools include *Mittelschulen* (intermediate schools) and *Gymnasien*. They may be run by the State, local authorities or private organizations.

Candidates for promotion from a primary school to an intermediate or secondary school are selected on the basis of an entrance examination or attendance at the new school for a trial period of 4 to 6 days. The first year at the intermediate or secondary school is a probationary period and pupils who fail to reach the required standard during this initial year (fifth or seventh year of schooling) have to return to the primary school.

Throughout the school course, the test method is only seldom used to determine educational progress, greater confidence being placed in the teachers' constant observation of their pupils and in their judgement of the latter's oral and written work. The half-yearly reports serve as a basis for the annual promotion of pupils, which depends not upon the results of special examinations, but upon the decisions taken by the teachers' council on the basis of directives laid down by the Ministry of Education.

Mittelschulen. These schools (in some *Länder* also known as *Realschulen*), are either organized as separate institutions or are run as special sections of the senior departments of primary schools. They generally comprise six classes, following on from the fourth primary school year. In the city-states of West Berlin, Bremen and Hamburg, there is a 4-year intermediate course, following on from the sixth primary school year; it includes a certain amount of pre-vocational training, and has hitherto been known as the *Technische Oberschule.* In Bavaria, the intermediate school course has so far been a 3-year one, beginning after the seventh primary school year, but it is now in process of being transformed into a 4-year course.

The intermediate school curriculum differs only slightly from one *Land* to another. Pupils must take one modern language, a second being optional. The following example, taken from North Rhine-Westphalia, may be considered typical, as regards both subjects and hours of work. It illustrates clearly the general nature of intermediate education, the only subjects which can be regarded as pre-vocational training being domestic science and shorthand.

TIME-TABLE FOR INTERMEDIATE SCHOOLS[1]

1. The figures in parentheses refer to time-tables in girls' schools; in other subjects the courses for boys and girls are identical.

The characteristic features of the teaching methods in intermediate schools are that instruction is related to everyday experience, ideas are presented clearly and straightforwardly, and the teaching is relevant to practical life.

The intermediate school leaving certificate is awarded to pupils who have reached the required standard at the end of the terminal class (tenth year of schooling), without their having to take any special examination.

Gymnasien. These schools have a special place among the general secondary schools in that they lead to the *Hochschulreife* or Higher School Certificate (which qualifies holders for matriculation at a university) and must therefore endeavour to give pupils a scholarly approach to all aspects of social and cultural life. They provide either a 9-year course, following on from the fourth primary school year, or a 7-year course, following on from the sixth primary school year.

The 9-year course (*Langform*) is of three types: (a) The classical academic high school (*altsprachliches Gymnasium*), with 9 years of Latin, 6 years of Greek and 7 years of English or French, together with mathematics, science and the other regulation subjects; a second modern language is optional. (b) The modern academic high school (*neusprachliches Gymnasium*), with 2 modern languages and Latin. The first modern language (generally English) must be studied for 9 years, while the second and third foreign languages (7 and 5 years of study respectively) may be either Latin and French (or English), or vice-versa. (c) The mathematics and science academic high school (*mathematisch-naturwissenschaftliches Gymnasium*), with 2 foreign languages (English and Latin or French)—and also a third optional language—gives pupils more advanced mathematics and science and the usual standard in the other subjects.

These three types of school exist either as separate institutions or as special sections of the same institution. When the modern and mathematics and science courses are available in the same school, the fifth to eighth classes provide a common foundation for both.

The following two time-tables (Hessen) show the curriculum and hours of work per week. In addition to the compulsory subjects, a number of optional classes of the 'tutorial' type may also be taken.

The 7-year curriculum (known as the *Kurzform* or *Aufbaugymnasium*) may be the same as that of the modern or mathematics and science high schools, or there may be some slight variation.

The curricula and hours of work per week in the *Gymnasien* also vary only very slightly from one *Land* to another. The above examples can therefore be considered typical.

Methods of instruction in the *Gymnasien* are based on the assumption that pupils are intellectually alert and have academic interests. Great importance is attached to the personal activity of the pupils, so that the outstanding characteristics of the tuition are joint work by teachers and pupils, independent study, and common discussion of problems.

At the end of the 13-year course at a *Gymnasium*, pupils take the senior school leaving examination, which consists of written papers in 4 subjects (German, two foreign languages and mathematics, or German, one foreign language, mathematics and physics or chemistry) and an oral examination in an optional number of subjects. Some *Länder* are trying the experiment of dividing the examination into two parts, the first taken at the end of the twelfth year of schooling and the second at the end of the thirteenth. The examination itself, organized by the teachers of the class concerned, takes place in the various schools in the presence of the headmaster and the whole of his staff,

1. Corresponding instruction in handwork may be provided for boys.

and with a government inspector (*Oberschulrat* or *Ministerialrat*) acting as chairman. The written papers are drawn up by the educational authorities on the basis of proposals from the school and are extracted from a sealed envelope just before the examination begins. This decentralization of the examination gives the pupil the advantage of a greater feeling of confidence, and also enables the board of examiners to form a sounder judgement of the examinees' attainments than would be possible if the setting of the examination papers were centralized. In order to lighten the burden of work when pupils are preparing for the examination during the last year at the *Gymnasium*, certain *Länder* have introduced the system of ending the study of some subjects earlier and dividing the school leaving examination into two parts, the first held at the end of the twelfth year and the second at the end of the thirteenth. Those who fail the examination can take it again the following year. The senior school leaving certificate, awarded to successful candidates and bearing the official seal of the school authorities, qualifies the holder for admission to all university faculties and academic studies.

Apart from the above-mentioned ordinary types of *Gymnasium*, there are also certain special *Gymnasien*, which either similarly qualify pupils for entrance to any institution of higher education, or else qualify them only for certain higher studies. Those qualifying pupils for any form of higher education are:

1. Evening high schools (*Abendgymnasien*), which provide a 3-year evening course occupying an average of 17 hours a week. They may be established by municipalities or private organizations, but also by the State, and are recognized by the latter. At these schools, young people who are already working and are at least 19 years of age can, in addition to their normal employment (except in the last semester), be trained for university studies and, by taking a special examination, obtain the senior school leaving certificate.
2. The workers' colleges (*Studienkolleges für Berufstätige*) (e.g. at Brunswick, Oberhausen and Wiesbaden), which are state-established residential institutes where gifted young men and women who have completed their vocational training can, on the recommendation of professional associations concerned with agriculture, crafts, industry and trade, or of trade unions, vocational schools or people's universities, take a free 2-year course of study which will enable them to sit for the higher leaving certificate. There are only 5 compulsory subjects: German, mathematics, English, history and sociology. In the second year, in addition, 2 subjects must be chosen for group study from the following fields: German, history, French, Latin, physics, chemistry, biology, geography or music.
3. Commercial high schools (*Wirtschaftsgymnasien*), which are experimental schools with a 3-year course, at present developing out of the advanced commercial colleges (*Wirtschaftsoberschulen*) (see under *Fachschulen*) and endeavouring to obtain recognition as a fourth type of *Gymnasium*. They are open to students who have completed the tenth year in an intermediate school, a higher commercial school or a *Gymnasium*, and in their curriculum, which also includes German, history, geography, two modern languages, mathematics and science, particular emphasis is laid on the various subjects covered by sociology and economics.

Institutions which do not qualify students for university entrance but only for admission to teacher training schools and art teacher training schools, are the senior girls' colleges (*Frauenoberschulen*) which now exist in some of the *Länder*. These colleges provide a 3-year course and follow on from the tenth class in the *Gymnasium*. The curriculum, in which only one modern language is compulsory, lays special emphasis on women's occupations (theory and practice of education, dietetics, hygiene, domestic economy and horticulture, music, needlework, art and handwork). By taking a supplementary examination, students can obtain the full higher leaving certificate.

Teachers in general secondary schools. Intermediate school staff are specialist teachers who must hold a teaching qualification in two subjects. The following are eligible to take the intermediate school teachers' examination: primary school teachers who have passed the second teachers' examination (in education) and have engaged in supplementary private or university studies; student teachers who have done 6 semesters of academic studies at a university and 2 semesters at a teacher training college. In some *Länder*, when primary school teachers have taken an optional subject in their first (academic) examination the taking of a second optional subject in the later examination entitles them to become intermediate school teachers. After giving suitable evidence of ability, an intermediate school teacher may be appointed headmaster of an intermediate school (*Rektor* or *Direktor*), or may become a school inspector or school administrator (*Schulrat* or *Oberregierungsrat*).

Gymnasium teachers must study two or three subjects at a university or art college and may enter for the first, academic or art, examination (fine arts or music) after 8 semesters, at the earliest. In addition to qualifying in their own particular subjects, they must also pass examinations in philosophy or psychology and the science of education. After the first examination, they take a 2-year course of educational and psychological studies at a training college. The second, or educational, examination takes place in the school itself and is intended to furnish evidence of the candidates' practical teaching ability. After the second examination, successful candidates can obtain posts as assistant secondary school teachers (*Studienräte*) and, after giving suitable evidence of ability, be promoted to the posts of assistant headmaster or headmaster (*Oberstudienrat* or *Oberstudiendirektor*). They are also eligible for appointments in school administration or inspection (*Oberregierungsräte* or *Oberschulräte*) or for transfer to the Ministry of Education.

Vocational and technical schools

Berufsschulen. These are part-time vocational schools, open to all young men and women who, after completion of their compulsory primary schooling, do not move on to an intermediate school, *Gymnasium* or other full-time school, but take up some practical career. The pupils in such schools include not only trainees in various trades,

commerce, industry, agriculture, mining and administration, but also young men and women workers without educational facilities, and even some who work at home or are unemployed. Hence the large number of 2,300,000 part-time vocational school pupils, averaging about 600,000 to 700,000 at each level from the ninth or tenth to the twelfth school year. Such schools usually have 3 classes: lower, intermediate and upper.

The aim of these part-time vocational schools is to supplement pupils' practical on-the-job training by theoretical instruction in their profession and general educational subjects (in some cases, they also receive workshop instruction in the use of modern machines). The course comprises 7 to 12 hours' work a week and, according to the number of hours, is held on 1 or 2 days of the week. The employers or parents of apprentices enrolled at a part-time vocational school are obliged by law to send them there, until completion of their compulsory schooling, without diminishing their earnings. If pupils wish to take posts as specialized workers or employees at the end of their practical and theoretical training, they must take a school leaving examination, which is organized by the representatives of the appropriate professional bodies and the vocational school teachers.

Part-time vocational schools also hold evening courses for older workers, thus providing them with an opportunity to improve their qualifications and to prepare for the examination for the title of master (*Meisterprüfung*).

Part-time vocational schools are run by communes, municipalities and local administrative districts (*Kreise*). In rural areas, the *Kreisberufschulen* serve all the village communes. There are also private part-time vocational schools, set up by large business firms (*Werkschulen*). All of them are subject to state supervision and are obliged to follow the official curricula.

Five main sections or types of school can be distinguished, which may be further sub-divided in the big cities.

Part-time agricultural schools. These schools cover agriculture, fisheries and forestry. Having regard to the urgency of the outside work to be done, the course may be run more intensively in the winter and shortened or suspended in the summer; a minimum of 280–290 hours of instruction must, however, be given in the course of the year. The curriculum in Bavarian schools of this type may be quoted as an example. The subjects taken in each of the 3 successive classes, with number of hours per week shown in parentheses, are: religious instruction (1); special branch of study (agriculture, domestic economy, or mechanics) together with rural occupations (at schools with appropriate equipment) (3); German language and arithmetic (2); civics (1); making a total of 7 hours' instruction per week.

Part-time domestic science schools. These are schools for girls who are occupied with housekeeping or have no career, and also for girl apprentices with less than 2 years' training, and unskilled workers. In Bavaria the time-table for this course, which consists of 8 hours' work a week, is as follows. In each year of the 3-year course pupils take religious instruction (1 hour per week), domestic science (3), civics (1), German (1), arithmetic (1); in addition, 1 hour per week is devoted to hygiene (including dietetics and nutrition) in the first year; to nursing, in the second year; and to care of infants and upbringing of children in the third.

Part-time commercial schools. In view of the great diversity of commercial activities, the part-time commercial schools are divided into specialized categories, for wholesale trade and retail trade, salesmanship and office work. The curricula also vary according to the pupils' previous education (primary or intermediate school). The minimum number of hours of work a week is 8 or 9; in Hamburg, according to the law, it is 12 hours. The Hamburg time-table for the course in office work for each of the 3 classes is as follows: German (2 hours per week), civics (1), geography (1), retail trade methods and correspondence (2), business accountancy (2), book-keeping (2), shorthand (2). The salesmanship course differs from that for office work in two respects: 'commodities' replaces shorthand and, in the first-year class only, advertising is taken instead of book-keeping. Typing, which is not included in the time-table, can be learnt at special evening classes. Foreign languages (English, French and Spanish) are also taught in some of these commercial schools.

Part-time industrial schools. There is an even greater number of specialized categories and different curricula in the part-time industrial schools. There are special classes, with corresponding curricula, for building, electrical engineering, metallurgy, carpentry, food production, the paper, textile and chemical industries, etc. The following general time-table (Baden-Württemberg) allows for attention to the special features of the various branches of industry.

TIME-TABLE FOR INDUSTRIAL 'BERUFSSCHULEN'
(in hours per week)

Subject	Class I	Class II	Class III
Religious instruction	1	1	1
Civics	1	1	1
German	1	1	1
Economics	1	1	1
Special branches of study (materials, professional instruction, special subjects)	2	2	2½
Special accountancy	1	1½	1½
Practical geometry	1	½	—
Technical and free-hand drawing	2	2	2
Total	10	10	10

In addition, each class does up to 2 hours' practical work (in workshops) and also gymnastics.

Part-time mining schools. There are special part-time training schools for the mining industry, which do not come under the Ministry of Education but under the Mines Commission (*Oberbergamt*), which is a Department of the Ministry of Economic Affairs. They provide 7 hours of teaching a week, based on a general scheme established by the Mines Commission. The subjects taught, with the number of hours per week shown in parentheses, are as follows: professional instruction (general, calculation and drawing) (4), civics (1), economics (1), Christian rules of life (optional) (1); total, 7 hours per week.

Part-time vocational school pupils who wish to improve their qualifications and general education can take supplementary courses, that is, either the advanced courses

(*Aufbaukurse*), which are run concurrently with the vocational training course, from the second semester onwards, and involve some 10 hours of work a week, arranged on one evening and the whole of Saturday, or else full-time advanced classes (*Aufbauklassen*) at the end of the training course. The courses include both practical and theoretical instruction. The practical part of the training is designed to improve pupils' technical skills; the aim of the theoretical part is to give pupils a more thorough theoretical knowledge of their profession and to broaden their general education. The compulsory general subjects include German, a foreign language, mathematics and science, civics and economics. At the end of this supplementary training, there is a state examination, on which the technical school leaving certificate (*Fachschulreife*) is awarded, qualifying successful candidates for admission to an advanced vocational training school. The technical school leaving certificate is equivalent to the intermediate school leaving certificate.

Berufsfachschulen. These full-time vocational schools provide courses of 1, 2 or 3 years' duration, with 30 to 36 hours of practical and theoretical instruction per week. They are run by the districts and municipalities or, in many cases, by business organizations, private bodies or individuals.

Their aim is to train promising boys and girls for senior positions in a practical occupation. If pupils, after attending such schools, have not yet completed their period of compulsory education, they are not obliged to go on to a general part-time vocational school, since the academic training given, from the point of view of standard and number of class hours, is in no way inferior to that provided by the part-time schools. On the practical side, on the other hand, pupils wishing to be classed as specialized workers or assistants, must still prove their ability by passing an examination organized by the appropriate professional body. In many cases, attendance at a full-time vocational school or intermediate school, followed by 2 years' practical experience, is enough to qualify pupils for admission to a *Fachschule.*

As shown below, there are several different types of full-time vocational school.

Full-time vocational schools for domestic economy and care of children. These include household management schools and schools for children's nurses and domestic helps. The former are very numerous, many of them being run by nuns or women's associations. The course, lasts 1 year. The subjects taught are German, civics, housekeeping, household accounting and book-keeping, cooking (including dietetics), early childhood education, housework, washing, ironing, handwork, horticulture, gymnastics and movement-games. The qualifying certificate exempts girls from attendance at a part-time domestic science school, places them on the same footing as those who have completed the first semester of training as children's nurses and domestic helps, and counts as a first step towards admission to a girls' *Fachschule.*

In the schools for children's nurses and domestic helps, the course lasts a year and a half. The curriculum, with 40 hours of work a week, includes, in addition to the subjects taught at the household management schools, educational theory, hygiene, singing and child care.

Full-time commercial schools. These schools are run by communes, business organizations or private persons. There are commercial schools (*Handelsschulen*) and higher commercial schools (*höhere Handelsschulen*). The commercial schools, which provide a 1- to 2-year course with 32 hours of instruction a week, train girls and boys for clerical posts in business firms or the civil service. The subjects taken are commercial instruction, commercial accounting, book-keeping, a modern language, economic geography, shorthand and typing; girls must also take domestic economy, if they wish to be exempted from attendance at a part-time vocational school. The qualifying certificate is equivalent to the intermediate school-leaving certificate.

Higher commercial schools, which provide 34 hours of instruction a week, are open to pupils who have completed the intermediate school course or the tenth *Gymnasium* class. Pupils study two foreign languages and receive a thorough business training. The course serves to qualify for admission to an advanced full-time commercial college (see *Fachschulen*) or commercial *Gymnasium* (see above).

Full-time industrial schools. Most of these schools have been established in recent years in order to provide particularly gifted young people with practical and academic instruction, in addition to their workshop and business training, which will equip them more thoroughly for their profession and give them a wider general education. The schools are generally established by municipalities and, in most cases, have a residential hostel annexed. The school leaving examination at the end of 3 years does not take the place of the journeyman's examination, which is organized by the appropriate professional body and is compulsory, but it is equivalent to the intermediate school leaving certificate and enables successful candidates, after 2 years' practical experience, to enter a full-time advanced technical training school (*Fachschule*).

Full-time schools of art. These schools provide instruction in the fields of music, dancing and handicrafts. Craft schools are also usually included among them, but they should really be classed as *Fachschulen* even though they are generally of the standard of *Berufsfachschulen.*

Fachschulen. These are advanced full-time vocational schools which train young people to become specialized workers, masters in their trade, technicians or practical engineers and ensure that they acquire a thorough knowledge of their particular subject and reach a high level of occupational skill. Such schools exist, not only for technical education but also for training in the fields of art, nursing and social welfare work. According to the purpose of the training, the courses range from 1 to 6 semesters in length. As a general rule, candidates for admission must be at least 18 years of age and have had adequate (2 years) practical experience. Under the heading of *Fachschulen*, there are also correspondence courses, organized by private undertakings; the correspondence lessons are very carefully prepared and the work done is scrupulously corrected. These courses give people who are already exercising a profession and are unable to attend an advanced full-time vocational training school an opportunity of continuing their education. Examinations may be organized by appropriate committees.

In order to give a general picture of the numerous types of advanced vocational training schools the following groups are listed below.

Advanced training schools for agriculture and domestic economy. These schools, which are run by the agricultural associations, include:

Farming schools (*Landwirtschaftsschulen*), with a course lasting 2 semesters and occupying 30 hours a week, generally held during the winter months.

Agricultural schools (*Landbauschulen*), providing a 2-year course of training for managers of agricultural concerns.

Higher agricultural schools (*höhere Landbauschulen*), with a 1-year course following on from the agricultural school training and leading up to an examination for the State Certificate of Farming. Successful candidates are qualified for training as teachers in agricultural schools and, if they have particularly good marks, for entrance to an agricultural college.

Country women's schools (*Landfrauenschulen*), with a lower class of 1 year and an upper class of 1 year. Those who pass the school-leaving examination qualify for the State Certificate of Household Management and are entitled to enrolment at a training school for women teachers in agricultural schools.

Advanced education and social welfare training schools (*sozialpädagogische Fachschulen*). Under this head should be grouped private educational institutions, or those run by organizations, municipalities or even the State, which cater mainly for women (but are also attended by some men) and train them for public service in the fields of education, nursing or social welfare. The following are quoted as examples:

Nursing schools, with a 2-year course in hospitals or faculties of medicine.

Gymnastics schools, training qualified teachers for private gymnastics instruction. The course lasts 4 or 5 semesters and a state examination is held at the end of it.

Welfare schools, with a 2- to 3-year course of training for employment in health services, youth welfare services and the welfare sections of various professional and industrial groups and institutions.

Schools for women kindergarten teachers, with a 2-year course of training in the education and care of small children from 3 to 6 years of age.

Advanced vocational training schools for management, administration and commerce. In addition to the special schools run by the appropriate unions for those engaged in the food and consumer goods trades, the ironmongery and household furniture trades, the book trade, the chemists' and photographers' trades, etc., there are some advanced general management training schools, such as:

Commercial academies which, in 4 semesters, train ambitious young sales people to become managers of commercial firms;

Administrative and commercial academies, which provide further training for public servants and business employees;

Advanced training schools for the Federal Postal and Railway Services, which aim at giving employees a training that will enable them to obtain promotion to senior posts in those services.

There are finally, and above all, the commercial colleges (*Wirtschaftsoberschulen*), with a 3-year course, following on from the intermediate school, commercial school (*Handelsschule*) or higher commercial school (*höhere Handelsschule*) courses, and providing instruction in economics, culture and languages, physics and mathematics, office work and gymnastics. These commercial colleges, which are generally maintained by municipalities, rank between the *Fachschulen* and the *Gymnasien*.

Schools of engineering. The schools of engineering are the most highly developed form of advanced vocational schools. They are advanced technical training institutions where qualified young people, engaged in manual occupations, after completing their apprenticeship, obtaining the technical school leaving certificate and having had the necessary practical experience, are given a 6-semester course of training as practical engineers. Schools of engineering are run by municipalities or the State; there are 79 of them in the Federal Republic and West Berlin. They provide training in the following fields: over-ground and underground building, surveying, regulation of water supplies and irrigation techniques, machine construction, electrical engineering, manufacturing techniques and industrial engineering, precision techniques, heating and ventilation, shipbuilding, chemistry and textiles. Some schools which provide training in several different fields are known as polytechnical institutes (*Polytechniken*). The course ends with a state examination. Candidates obtaining very good or good average results in the examination are eligible for admission to a college of technology (*technische Hochschule*).

Mining schools. The aims of the mining schools are similar to those of the schools of engineering. They are run by the mining employers' associations and the Mines Commissions. Their special characteristic is that the training they give is continuously linked with practical mining experience. The standard for admission is that of the technical school leaving certificate (*Fachschulreife*); there are three types of mining school, following on from one another. These are: a 2-year course of preparatory training at a *Bergvorschule*, students attending the school on 3 mornings or afternoons a week, the rest of the time being devoted to practical work; a 2½-year course of training at a *Bergschule*, for the training of foremen and mine inspectors, alternating 3 days a week with work in the pits and leading up to the foremen's examination; a 1-year course of training in the senior department of the *Bergschule*, for senior foremen and managers.

There are mining schools for coal mining, brown coal mining, ore mining, petroleum mining and salt mining, as well as for quarries and earthworks. Those who complete the mining school course and are marked 'good' in the final examination can be enrolled as regular students in the mining faculty of a college of technology.

Teaching staff in vocational training schools. The staff consists of full-time, part-time and auxiliary teachers, together with workshop instructors.

The full-time teachers have had practical experience in their own sphere of work and an academic training as vocational school teachers, lasting 4 to 6 semesters, at a vocational teacher training college or, in the case of certifi-

cated commercial teachers, of 8 semesters at a university faculty of economics. After the first teachers' examination, they teach for 1 or 2 years at a part-time or full-time vocational training school; they then take the second state examination and are thereafter appointed as head teachers in agriculture, industrial or commercial training schools. The part-time teachers give only a limited number of hours of instruction, being occupied mainly in other schools. The auxiliary teachers are specialists other than established teachers, in the field of agriculture, handicrafts, industry and trade, or else engineers. Full-time teachers, with appropriate qualifications, can become heads of departments, headmasters or school inspectors working for the intermediate and higher educational authorities.

Teacher training schools

Since teachers in schools of every kind are required to have had an academic education, there are no longer any teacher training schools at the secondary level in the Federal Republic.

Women kindergarten teachers, who do not rank as school teachers but as specialists in early childhood education, are trained in advanced full-time vocational schools (see above).

Out-of-class activities

All secondary schools have a system whereby pupils take part in the administration of the school (*Schülermitverwaltung*); such a system is prescribed by law in most of the *Länder*. It consists in allowing pupils to take part in the management of school affairs outside the sphere of actual teaching; for instance, they help to keep order, run libraries, prepare for school entertainments, excursions and other events, and also contribute to the welfare of fellow-pupils in need of assistance. Such co-operation is ensured by means of a pupils' committee (*Schülerausschuss*) composed of representatives elected by the pupils themselves.

Similarly, all schools have a parents' committee, consisting of representatives of the parents of children in the various classes. These committees are responsible for ensuring good relations between the school and the homes and for co-operating in the welfare services and other activities organized by the school.

In most of the *Länder*, each part-time vocational training school has an advisory council, composed of representatives of the parents, employers, vocational school teachers and other persons concerned with such training.

It is difficult to organize many sports and games outside the hours of actual tuition, since schools are either open for half the day only or, in the case of most part-time vocational training schools, provide each class with instruction, morning and afternoon, on one day of the week only. Many high schools (*Gymnasien*), however, have sports clubs, e.g. for ball games and rowing, which are run by the pupils themselves. Amateur theatrical and singing festivals are also very often organized, at which not only pupils from the various schools and towns but also young people from different *Länder* gather together. The hiking movement, which nearly died out in the tragic 1940s, has now taken on a new lease of life and groups of young people on their free days and during the holidays are once again roaming over the countryside and visiting foreign countries.

TRENDS AND PROBLEMS

A critical review of secondary education in the Federal Republic of Germany reveals the following outstanding characteristics: basic differentiation between general and vocational training schools; early decision on the type of secondary education most suitable for a pupil; determination of most suitable type of secondary education by selection, instead of by self-assessment; combination of professional apprenticeship and theoretical instruction in compulsory vocational training schools; maintenance of a balance between the free development of the personality and social requirements.

The basic differentiation between the two forms of education is due primarily to the history of educational development: vocational training became part of the educational system much later than general education. The differentiation is retained, in order to ensure a thorough education, but it is gradually becoming less clear-cut as a result of efforts to make vocational training open up a second avenue (known as *der zweite Weg*) to higher education and the university. Such efforts are facilitated by the fact that tuition and materials are free of charge in every type of school.

The taking of an early decision on the transfer of pupils from the primary school to the appropriate type of secondary school is opposed by some people on the grounds that it is contrary to what psychology teaches us and to the requirements of society; on the other hand, many people in intermediate school and *Gymnasium* circles consider it necessary in order to maintain the high standard of those schools. The extension of the period of basic primary schooling to 6 years has been achieved for the past 15 years in the three city states of West Berlin, Bremen and Hamburg. However, in the other *Länder* it is still a controversial question, and the idea of further extending it everywhere to 7 or 8 years without differentiation has met with general disapproval.

The assignment of pupils to the various branches of secondary education by means of selection, based either on the strict examination system or on the modified system of a week's trial attendance at school, depends solely upon the decision of the teachers. The experiment of making pupils co-operate in the process of vocational guidance and self-assessment is already being conducted in some comprehensive schools, but this system has not yet been generally introduced. For the first time, in the 1959 plan outlined by the German Council for Education and Culture, a solution on these lines is proposed for the transfer of pupils to secondary schools, with the exception of classical high schools (*humanistische Gymnasien*). This is the 'transition course' (*Förderstufe*) proposal but, here again, outside judgements carry greater weight than the pupil's own initiative. The idea of selection should be gradually superseded by that of self-assessment.

The combination of professional apprenticeship and theoretical instruction in compulsory vocational training schools gives all young people who are not already attending a full-time school (intermediate, vocational or general secondary school) the possibility of continuing their education up to the age of 18. From the educational point of view, this system is of special significance, as not only are the part-time vocational schools thinking of increasing their number of hours of instruction but the administrative authorities are also considering ways of improving industrial training. It is likewise possible for pupils, through the 'second avenue', to develop and extend their education when desired.

This combination of professional apprenticeship and theoretical instruction also ensures the necessary contact between professional life, society and the school community; general secondary schools, of course, also aim at establishing such contact, but it is more difficult for them. The principle that education should be solely conditioned by social requirements is not accepted, for it is diametrically opposed to the free development of the personality according to modern ideas. The maintenance of a proper balance between these two factors is the outstanding characteristic of secondary education in the Federal Republic of Germany.

STATISTICS: FEDERAL REPUBLIC

Population (mid-year 1958 estimate): 52,150,000.
Area: 95,738 square miles; 247,960 square kilometres.
Population density: 545 per square mile; 210 per square kilometre.

Summary of school statistics, 1953–57. In 1957/58, total enrolment (not including pre-primary and adult education, or data for the Saar and for West Berlin) was over 8.5 million, being about 17 per cent of the total population. Of these pupils, 56 per cent were in primary schools, 13 per cent in intermediate schools (*Mittelschulen* and *Realschulen*, and high schools (*Gymnasien*), 27 per cent in full-time and part-time vocational schools, 2.5 per cent in institutions of higher education, and 1 per cent in special schools. The proportion of girls was 49 per cent in primary schools, 44 per cent in intermediate schools and high schools, 46 per cent in vocational schools, 57 per cent in teacher training colleges, and 16 per cent in the universities and other institutions of higher education. The teaching staff in primary and secondary schools consisted of nearly 255,000 teachers, of whom 37 per cent were women. Between 1953 and 1957, primary school enrolment decreased by 11 per cent, secondary school enrolment increased by 2 per cent, and higher education by 36 per cent. (See Table 1.)

Enrolment trends in secondary education, 1950–57. Between 1950 and 1957, general secondary school enrolment increased by 38 per cent and vocational school enrolment by about 25 per cent. During this period the proportion of girls remained at 44 per cent in general secondary schools, but increased slightly to 46 per cent in vocational schools. The average total enrolment for the period 1955–57 was higher than for the period 1950–54, though the enrolment ratio dropped from 83 to 79, owing to an increase in the estimated population 15–19 years old. (See Table 2.)

Examination results in secondary education, 1953–57. Between 1953 and 1957, the number of certificates awarded for passing the final examination of intermediate schools increased by 77 per cent, while the final high school certificates increased by 84 per cent. Girls were more numerous

than boys among recipients of the middle school certificate, but they received only about one-third of the high school certificates each year. (See Table 3.)

Educational finance, 1957/58. During the fiscal year which began in April, 1957, total educational expenditure (not including clinics, research institutes and private schools) amounted to 5,955 million Deutschmarks, averaging 116 marks per inhabitant. This expenditure was met by receipts from the Federal Government (1 per cent), Länder governments (60 per cent), local authorities (31 per cent), tuition fees (2 per cent) and from rents and loans (6 per cent). Recurring expenditure, representing 76 per cent of the total, was distributed by level and type of education as shown in Table 4C.

Note. Data on adult education, and those concerning the Saarland and West Berlin are not included in this table.

1. Kindergartens only, not including *Schulkindergärten*.
2. *Schulkindergärten* only.
3. Including data relating to the secondary level of 'new system' schools.
4. In addition, there were part-time teachers, who numbered 33,319 (F. 11,758) in 1957/58.
5. Not including data relating to the secondary level of 'new system' schools.
6. In addition, there were part-time teachers, who numbered 10,813 (F. 3,459) in 1957/58.
7. Including part-time teachers; in all vocational schools, their number was 34,456 (F. 6,577) in 1957/58.
8. In the previous edition, engineering schools were included under 'vocational'.
9. Including part-time teachers who numbered 1,042 (F. 270) in 1957/58.
10. Number of teachers in secondary schools who participate in the post-graduate teacher training.
11. Not including post-graduate teacher training.

STATISTICS: WEST BERLIN

Population (mid-year 1958 estimate) 2,224,000.
Area: 186 square miles; 481 square kilometres.
Population density: 11,957 per square mile; 4,624 per square kilometre.

Summary of school statistics, 1953–57. In 1957/58, total enrolment (not including pre-primary and adult education) was about 340,000, representing 15 per cent of the total population. Of these pupils, 45 per cent were enrolled in primary schools, 19 per cent in general secondary schools, 27 per cent in vocational schools, 6 per cent in higher educational institutions, and 2 per cent in special schools. The proportion of girls was 49 per cent of the enrolment in primary, secondary and vocational schools and 18 per cent in higher education. Women teachers were 47 per cent of the teaching staff in the primary and secondary schools, in which the average pupil-teacher ratio was 28. Between 1953 and 1957, only vocational and higher education showed increased enrolment. (See Table 1.)

Enrolment trends in secondary education, 1950–57. Secondary school enrolment seems to have risen rapidly between 1950 and 1953, then fallen somewhat in the next 3 or 4 years. Vocational school enrolment increased steadily up to 1956, and also fell behind in 1957. The proportion of girls remained at 49 per cent in the general secondary schools throughout this period; in the vocational schools this proportion has also been maintained in the last few years. The average total enrolment in secondary education has, during this period, almost equalled the estimated population 15–19 years old. (See Table 4.)

Examination results in secondary education, 1953–57. Between 1953 and 1957, the annual number of certificates for passing the final examination of the intermediate school increased threefold, the proportion of girls remaining at about 55 per cent. For the final high school examination, the number of certificates increased only one and a half times; about 40 per cent of these were awarded to girls. (See Table 2.)

Educational finance, 1957/58. For the fiscal year which began in April 1957, total educational expenditure amounted to 327.6 million Deutschmarks, averaging 147 marks per inhabitant. Recurring expenditure represented 88 per cent of the total.

EASTERN GERMANY

THE EDUCATIONAL SYSTEM

The present educational system began in 1945 when the Deutsche Verwaltung für Volksbildung (German Public Education Department) was set up as the central authority responsible for co-ordinating educational matters in the states of Mecklenburg, Brandenburg, Saxony, Saxony-Anhalt, and Thuringia, in the Soviet zone of occupation. In 1946, at the first Educational Congress, which was held in East Berlin, the general reorganization of the educational system was discussed. The law on the democratization of German schools (*Gesetz zur Demokratisierung der deutschen Schule*), promulgated in 1946 by the authorities of the Soviet zone of occupation, laid down the main lines of a single-ladder school system and provided for compulsory schooling; thereafter the text of this law was adopted by the five States of the zone, and in 1948 its provisions were extended to East Berlin.

On the proclamation of the German Democratic Republic (October 1949), the main provisions of the 1946 law were incorporated in the new Constitution, which in particular laid down the following general principles and aims.

'1. The arts and sciences, and education in them, are free to all.

'2. The State participates in their development and guarantees them its protection, particularly against abuse for purposes contrary to the provisions and spirit of the Constitution.' (Article 34.)

'1. All citizens have the same right to education and to a free choice of profession.

'2. The education of young people and the subsequent intellectual and vocational training of citizens are provided by public institutions in all spheres of state and community activity.' (Article 35.)

'1. Public institutions for school education, and the organization of the teaching which they provide, are the responsibility of the *Länder*.[1] For this purpose the Republic promulgates laws containing uniform basic provisions, and may also set up public educational establishments itself.

'2. The Republic likewise decrees uniform measures regarding the training of teachers. This training is given in the universities or in establishments of equivalent standing.' (Article 36.)

'Schools provide for the education of the young in the spirit of the Constitution; they aim at training men of independent mind, conscious of their responsibilities, and ready and qualified to take their place in the life of the community. As a dispenser of culture, the school has the task of bringing up the young in a spirit of peaceful and friendly co-operation between the peoples, and of true democracy.

'The parents shall take part in the school education of their children through the establishment of parents' councils.' (Article 37.)

'Every child must be given the opportunity to develop

1. In July 1952, the 5 *Länder* were replaced by 15 regions (*Bezirke*). The regions are divided into districts (*Kreise*). There is a further division of rural districts (counties) into communes (*Gemeinden*) and of urban districts (cities) into wards (*Stadtbezirke*).

his physical, intellectual and moral capacities to the maximum. The school careers of children must on no account depend on the social and economic conditions of their parents. Indeed, children who are at a disadvantage because of social conditions are to be given special care. Gifted pupils from all classes of the population must be given the opportunity to attend vocational schools, secondary schools and university.

'Tuition is free of charge. Textbooks and educational equipment used in compulsory schools are supplied without cost; in case of need, scholarships and other measures will promote attendance at vocational schools, secondary schools and university.' (Article 39.)

'Religious instruction is the concern of religious societies. The exercise of this right is guaranteed.' (Article 40.)

A leading role in the formulation of educational policy and the preparation of legislation is played by the Central Committee of the Socialist Unity Party (*Sozialistische Einheitspartei Deutschlands* or SED). Laws and decrees are passed by the parliament (*Volkskammer*) and issued by the Council of Ministers. Under the Council of Ministers the Ministry of Public Education (*Ministerium für Volksbildung*) is the highest authority for the control of general education, teacher training, vocational education provided in the various part-time vocational schools (*Berufsschulen*), and adult education. Technical education in full-time technical schools (*Fachschulen*) and all types of higher education except teacher training come under the State Secretariat for Higher Education (*Staatssekretariat für Hochschulwesen*).

THE DEVELOPMENT OF SECONDARY EDUCATION

The legislation of 1946, confirmed by Article 38 of the Constitution of 1949, established an 8+4 pattern of general education, a unitary 8-year school (*Grundschule*) compulsory for all, followed by a 4-year high school (*Oberschule*) which prepared students for university entrance. Education was made compulsory up to the age of 18, so that pupils who did not go on to the *Oberschule* or other full-time (public) school were obliged to attend a part-time vocational training school. Alongside the *Oberschule* there grew up a 10-year school covering 8 primary (*Grundschule*) and 2 middle school (*Mittelschule*) grades. External examinations were taken after grade 8 (*Abschlussprüfung der Grundschule*), grade 10 (Middle School Maturity examination or *Prüfung der mittleren Reife* and grade 12 (High School Maturity examination or *Reifeprüfung*). In accordance with the requirements of the Constitution, provision was made for students who had not followed the regular *Oberschule* course to study for university entrance in part-time schools and courses.

The subsequent history of general secondary education has been characterized by two main trends: (a) the development and extension of the 10-year school; (b) the transformation of the programme of general education into one of general and polytechnical education with vocational experience. Some of the principal events in this movement have been as follows:

30 July 1951. Resolution of the Third Party Congress of the SED on the introduction of 10-year schools.

1 November 1951. Adoption of the first five-year plan, with a substantial increase (48 per cent) of expenditure on education.

29 July 1952. Resolution of the Central Committee of the SED on the objectives of education and steps required to improve educational methods.

21–23 May 1953. Conference convened by the Central Pedagogical Institute to discuss the theoretical and practical aspects of polytechnical education.

May 1956. Fifth Pedagogical Conference; the conference expressed its approval of the universal development of polytechnical education as 'the main link in the chain for raising the level of educational work in the schools and as a major objective assigned to the school by society, to bring about the rapid development of socialist production and technology'.

September 1958. The subject 'Introduction to socialist production' included in curricula of middle and high schools.

June 1959. Fourth Conference of the Central Committee of the SED. The Conference laid down that the 10-year school, followed by vocational training, should be the principal educational ladder leading to technical and university education.

12 November 1959. Ordinance introducing a uniform system of general education.

2 December 1959. Law on the Socialist Development of Education in the German Democratic Republic.

Under this recent legislation attendance at the 10-year general and polytechnical school will be compulsory for all children by the school year 1964/65.

As regards the vocational education system, combining apprenticeship training with theoretical instruction in *Berufsschulen*, the foundations were laid in the Law for the Democratization of German Schools, of 1946. In 1954 a separate Ministry of Labour and Vocational Training was established, but in 1958 responsibility for the general supervision of *Berufsschulen* reverted to the Department of Vocational Education of the Ministry of Public Education. The whole system of vocational training was reorganized following the Resolution of the Council of Ministers of 28 June 1956: in particular this created a new type of industrial training school, the *Betriebsberufsschule*, in which the school itself, the workshops allocated to the school and the students' living quarters are in a single training centre under the supervision of the manager of the factory.

The responsibilities of the State Secretariat for Higher and Technical Education were defined in a decree of the Council of Ministers issued on 13 February 1958. These include determining the principles, content and structure of technical education, issuing directives for its organization (school regulations, teachers' salaries, selection and admission of students, etc.), planning and distribution of funds, etc. The technical schools themselves may be operated by other 'technical' ministries, although many of the latter (e.g. Ministry for Heavy Machinery Construction, Ministry for Light Industry, Ministry for the Food Industry) were abolished by the Law of 11 February 1958; the technical schools they had been operating were placed under the direct control of the State Secretariat for

Higher Education, or combinations of national industries or the Departments of Technical Education of district councils.

Administration

The Minister of Public Education is assisted by an advisory council (*Kollegium*) comprising both senior officials and prominent educationists outside the Ministry. There are several technical agencies attached to the Ministry, notably the Central Pedagogical Institute (*Deutsches Pädagogische Zentralinstitut*), which acts as a documentation and research centre, prepares syllabuses for general schools and, in collaboration with the publishing house of Volk and Wissen Verlag, is responsible for the production of all textbooks and various teachers' publications. Another central agency prepares and distributes audio-visual equipment and materials. The Department of Vocational Education, working in association with state industries, is responsible for the organization of vocational schools and their programmes. In devising educational policy, the Ministry ascertains the opinions of the educational authorities and the teaching profession by means of pedagogical conferences, which meet to review questions concerning education as a whole or particular problems.

At the local level the work of the Ministry of Public Education is carried out by the departments of education of the regional and district (county and city) councils; these departments are responsible both to the Ministry and to their respective councils. Regional departments are advised by offices of public education (*Volksbildungsämter*). Individual schools are placed under the control of district councils, except the primary teacher training schools (*pädagogische Institute*) which are administered by the regional authorities.

Parents' councils. According to Article 37 of the Constitution, 'the parents shall take part in the school education of their children through the establishment of parents' councils'. There is at least one elected member for each class in the school; council elections are organized by the director of the school and parents who have children at the school take part both as voters and as candidates.

The council also includes representatives of industries and firms, the Pioneer leader of the general primary school or the Free German Youth secretary in the middle and secondary schools, and representatives of the Democratic League of Women.

Parents are also kept informed of their children's academic progress by being invited to regular meetings held at the school and by receiving visits at home from the teachers.

Supervision and inspection. The functioning of the schools is supervised by education inspectors serving under the Ministry of Education. There are three categories of education inspector: principal inspectors (*Hauptschulinspektoren*); regional inspectors (*Bezirksschulinspektoren*); district inspectors (*Kreisschulinspektoren*).

Education inspectors exercise supervision with regard to material condition of schools, compliance with ministerial regulations, conformity to curricula, methods used, school administration, etc.; in addition, the inspectors ensure the harmonization of school activities with the interests of the State.

Teachers are directly under the authority of the heads of the establishments in which they teach; heads of schools are personally responsible to the Government for the satisfactory functioning of their schools. In schools with four or more teachers, the head is assisted by a pedagogical council comprising the first assistant and all other teachers, the school leader of the Pioneer movement or the secretary of the Free German Youth, and a representative of the parents' council. In schools with fewer than four teachers, the staff meets in regular pedagogical conferences.

The teachers must adhere to curricula and syllabuses prepared by the Ministry.

Finance. The state budget is prepared annually, taking into account the requirements of long-range economic development plans. It embodies the central government budget and the budgets of the 15 regions; each regional budget is made up of the budget of the regional council and of the districts in that region; each district budget similarly incorporates the budget of the administrative units (rural counties or city wards) in the district. Each level of government has some responsibility for the financing of education. The Central Government has direct responsibility for the construction of school buildings and for higher and technical education; the regions are directly responsible for primary teacher training schools. Salaries of teachers and administrative staff are paid by the district authorities, while local communities or city wards pay for such current requirements as supplies, teaching materials, cleaning, etc.

Attendance at the 10-year general polytechnical school, the *Oberschule* (grades 9 to 12) and vocational schools is free. Children from poorer families qualify for a monthly allowance of up to 60 marks per pupil in the 9th and 10th grades, and up to 80 marks in the 11th and 12th grades.

Buildings and equipment. Buildings are constructed according to model plans laid down by the central authorities. In particular these plans allow for a surface area of 1.4 square metres per pupil in classrooms and 1.8 square metres in workshops, laboratories, etc., the normal number of pupils per room being taken as 36. Lighting is provided on the basis of 100 luxes per pupil. New schools are equipped with shower-rooms.

School welfare services. Section 35 of the school regulations prescribes careful attention to matters of hygiene and health. Pupils are examined at regular intervals by school doctors and dentists and if necessary are sent on to specialists or institutions coming under the Ministry of Health. Teachers are also examined regularly, the expenses of treatment and convalescence being borne by the Teachers' Federation.

TYPES OF SECONDARY EDUCATION

General secondary schools

It is intended that by September 1965 the new type of 10-year general polytechnical school with an integrated

programme will be compulsory for all children, and that this school, followed by a period of vocational training, shall be the principal path to higher and technical education. The 4-year high school (grades 9 to 12) and to a decreasing extent the separate middle school (grades 9 and 10) continue to exist side by side with the newly-formed 10-year schools.

The school year begins in September and lasts until the end of June, and comprises 38 weeks—30 weeks to carry out the syllabus and 8 weeks for revision. The school week consists of 5½ days; the usual class period is 45 minutes. Christmas holidays are from 24 December to 3 January, and there is a 2-week holiday at Easter.

High school (*Oberschule*). This school provides a 4-year course from grade 9 to 12 and leads directly to university education. There are three types of *Oberschule*, emphasizing respectively the study of modern languages (A), mathematics and science (B), and classical languages (C). The curricula and time allotted to the various subjects in these three types of *Oberschule* are given in the following table.

TIME-TABLE FOR OBERSCHULEN
(in 45-minute periods per week)

Subject	Year of schooling

Total	35	36	36	37	36	37	36	37	38	37	37	38

The work of the pupils is checked by means of written and oral tests during the year and their progress is recorded on individual record cards. The decision to promote a student is taken at a meeting of the teachers who taught him during the year, and is subject to confirmation by the headmaster. If a student fails twice he must leave school.

The Maturity (university entrance) examination taken at the end of the 4-year course consists of four written and at least two oral examinations. One of the oral examination subjects must be history or current events, the other is related to the career or occupation the candidate proposes to take up on leaving school. The candidate may be required to take oral examinations in additional subjects to a maximum of five. A pass in the Maturity examination is subject to confirmation by an Examination Commission which has voting and advisory members. The voting members are the chairman of the commission, the head of the school, the teacher in charge of the pupil's class, and all the teachers who taught in the class; the advisory members include among others representatives of the parents' council, youth organizations, the Teachers Union, and the universities.

Middle schools (*Mittelschulen*). This 2-year school (grades 9 and 10) is now being reorganized in view of the establishment of the new 10-year schools. The curriculum and time allotted to the various subjects, as laid down in an official instruction for the year 1957/58, were as follows (figures indicate the number of periods per week in each of the 2 years): German, 4, 4; Russian, 3, 3; mathematics, 5, 5; physics, 3, 3; chemistry, 2, 3; biology, 2, 2; geography, 2, 2; history, 2, 3 (first semester only); civics, 1, 3 (second semester only); art, 1, 1; music, 1, 1; physical education, 3, 3; totals, 29, 30. In addition pupils could take as elective subjects a second foreign language (3, 2), and shorthand (1, 1). All pupils devoted 250 hours per year to the subject 'Introduction to socialist production' and to productive work. This time-table should be compared with the study plan for the new 10-year schools, which is given below.

Ten-year general polytechnical secondary school (*Zehnklassige allgemeinbildende polytechnische Oberschule*). This is the name given to the new 10-year school. It comprises a preparatory or elementary section (grades 1 to 4) for children aged 6 to 9, and an upper section (grades 5 to 10) for children aged 10 to 16; these two sections are stages in a single and continuing course.

A new curriculum and detailed subject syllabuses were issued by the Ministry of Public Education on 20 June 1959, with effect from the following September. Polytechnical education and training begin in the elementary section with handicrafts in the classroom. In the 5th and 6th grades this includes an initiation into gardening and agriculture. Beginning at grade 7 pupils spend 3 or 4 consecutive periods, 1 day a week, at a factory or other place of employment in the socialist economy and participate in productive work. They thus acquire a basic knowledge of the construction and use of the most important tools, machines and instruments, and of technological processes and economic organization. What they learn in their mathematics, science and social studies lessons is thus clarified and extended through the opportunity to see the practical application of such knowledge. The pupils also acquire an understanding of the place of human labour in society, and a respect for the labourer. After leaving this school the pupils can obtain their skilled worker's diploma by following a 2-year course in a vocational school; they may at the same time study for the Maturity examination, in which case the course lasts 3 years. They also have the possibility of entering employment and studying for higher qualifications (general and vocational) in factory schools, evening schools, workers' colleges, etc.

Teaching staff. Teachers for secondary classes (grades 5 to 12) are trained in pedagogical institutes, university faculties of arts and science, the College of Education at Potsdam, the Physical Education College in Leipzig and the College of Music at Weimar. Candidates for teacher training at this level must hold the Maturity Certificate. Their studies last 4 years and comprise specialization in 2 subjects, including the teaching of these subjects, training in social sciences and polytechnical education, and education and psychology including practice teaching.

Vocational and technical schools

Vocational schools (*Berufsschulen*). These schools provide part-time instruction, usually 14 periods a week spread over 2 days, in connection with apprenticeship training in a factory or other enterprise. Administratively they may be categorized as schools run by a municipality or rural district, factory schools (which have been referred to above), and central schools, which cater for trades in which the number of apprentices in any particular locality would be quite small.

Until the new 10-year general polytechnical school has been made compulsory for all, these schools still admit pupils who have completed 8 years of general education. The training usually lasts 2 to 3 years, according to the trade. The subjects taught include trade technology, mathematics and science, German and foreign languages, civics and physical education.

The final examination consists of a written part and a practical part, the latter being carried out in front of a 5-member examination commission, the chairman of which must have had at least 6 years' experience in the trade and 3 years' teaching experience in a vocational school.

Technical schools (*Fachschulen*). These are full-time schools for the training of technicians who will occupy intermediate positions of responsibility, between the skilled workers with apprenticeship and *Berufsschule* training and professional staff trained at institutions of university level. There are technical schools not only for all the various branches of the agricultural and engineering industries but also for commerce, medicine (technical assistants, dieticians, midwives, etc.), foreign languages, library science, graphic arts, arts and crafts, music, dramatic arts, etc., and a school for planning and statistics.

Until recently the principal avenues giving access to the technical schools have been (a) completion of 8-year *Grundschule* and vocational training as a skilled worker, or (b) completion of middle or high school (Middle School Maturity or High School Maturity Certificate). When the change-over to the compulsory 10-year general polytechnical school has been completed the requirements for admission will be completion of the 10-year school and a minimum of 2 years' vocational training.

A full-time technical school course usually lasts 3 years (6 semesters). The basic pattern of the curriculum varies slightly according to entrance qualifications of the students; the present time-table for pupils who have completed middle school or high school (10 or 12 years' schooling) is given in the following table.

It is also possible to complete a technical school course by evening or correspondence courses. These part-time courses last 5 years.

TIME-TABLE OF FACHSCHULEN
(in periods per week)

Subject	Semester						Total hours
	1	2	3	4	5	6	
Social studies	5	5	4	4	2	—	380
German	2	2	1	1	—	—	114
Russian	2	2	2	2	—	—	152
Technical subjects	27	27	27	27	30	34	3 268
Industrial economics (included in 'technical subjects')	—	—	(3)	(3)	(3)	(3)	(228)
Physical education	2	2	2	2	2	—	190
Total	38	38	36	36	34	34	4 104

During his period of study in a *Fachschule* the student has to complete a one-month's practicum in a state-owned industry. The final examination consists of written examinations in social studies, German, Russian, and from two to four technical subjects, and of an oral examination in two technical subjects. Each student is also given a project to carry out in his own time; the project is designed to test his ability to master the various political, economic and technical problems concerned.

The examination is carried out by a commission. The chairman is usually the director of the school (he may also be a person appointed by a state-owned industry or by the district school authority). The commission consists of the examining teachers, two or three representatives of industries related to the particular technical field of the school and a representative of the Free German Youth.

Students who have successfully passed the examination receive certificates saying they have completed the required courses. Those who have achieved particularly good results are given a diploma. Holders of such diplomas are given preferential treatment in their professional careers.

Teacher training schools

Teacher training institutions below higher education level are the institutes of teacher training (*Institute für Lehrerbildung*) and the pedagogical institutes (*pädagogische Institute*). The former train teachers for the lower classes (grades 1 to 4, ages 6 to 10) of the *Grundschule* or 10-year school. The course lasts 4 years and is open to pupils who have completed grade 8. The latter train teachers for grades 5 to 8 (ages 11 to 14) of the general school; they recruit pupils who have completed secondary school and offer a 3-year course. Youth leaders are also trained in the *Institute für Lehrerbildung*.

Out-of-class activities

There are two principal organizations providing opportunities for the social and intellectual development of students; the Free German Youth (*Freie Deutsche Jugend* or FDJ) which caters for young people from 14 to 26, and the Pioneer Organization 'Ernst Thaelmann' for children from 6 to 14. Members of these movements are expected to support actively the work of the Government and the SED and by their conduct and the quality of their work to set an example to others. The movements organize sports, games, excursions, dances, etc. There are also various clubs within the schools: 'young scientists', 'young historians', 'young artists', 'young technicians', 'skilful hands'.

STATISTICS

Population (mid-year 1958 estimate): 17,355,000.
Area: 41,635 square miles; 107,834 square kilometres.
Population density: 417 per square mile; 161 per square kilometre.

Summary of school statistics, 1953–57. In 1957/58, total enrolment of about 2.9 million pupils (not including students enrolled in correspondence courses, nor adults in folk high schools and in workers' and peasants' faculties) represented one-sixth of the total population. However, the total enrolment figure for 1957 was about 13 per cent below the high level reached in 1953, partly due to a reorganization of the school system, whereby a number of primary schools were transformed into lower secondary schools (*Mittelschulen*). Of the total enrolment in 1957, nearly 12 per cent was in kindergartens, 37 per cent in primary schools, 24 per cent in secondary schools (*Mittelschulen* and *Oberschulen*), 23 per cent in vocational and teacher training schools (*Fachschulen* and *Berufsschulen*), 2 per cent in special education. The average pupil-teacher ratio was 23 in primary schools and 24 in secondary schools. (See Table 2.)

Educational finance, 1958. The provisional budget of the State for education in 1958 amounted to 2,812 million East Deutschmarks, averaging 172 marks per inhabitant. (See Table 1.)

1. Not including kindergartens maintained by enterprises owned by the people (*volkseigene Betriebe*); their number was 1,135 in 1954/55.
2. Including data on *Kinderhorte*, institutions where children attending regular schools can spend their free time; enrolment includes, therefore, double-countings.
3. Owing to school system reorganization a number of primary schools were transformed into secondary schools (*Mittelschulen*), hence the decrease in primary education figures.
4. Including teacher training schools in which there were 17,288 (F. ...) full-time students enrolled in 1957/58.
5. Not including assistants, who numbered 364 in 1957/58.
6. Including 21,021 (F. ...) students in correspondence courses and 28,943 (F. ...) in evening schools.
7. Not including girls enrolled in vocational part-time schools (*Berufsschulen*).
8. Teachers in higher teacher training institutions are included with those in higher general education.
9. Full-time students only; in addition to the total enrolment in all institutions of higher education there were students enrolled in correspondence courses: they numbered 19,111 (F. 1,528) in 1957/58; 16,641 (F. 1,563) in 1956/57; 14,594 (F. 1,491) in 1955/56; 13,128 (F. 1,263) in 1954/55; 10,121 (F. 886) in 1953/54.

10. Not including folk high schools.

GHANA

EDUCATIONAL SYSTEM

The Government exercises general control of the educational system through laws passed by the Ghana Parliament and regulations based upon them issued by the Ministry of Education and Information. Two main Ordinances—the Teachers' Pensions Ordinance and the Education Ordinance—which date from the period before Independence are still in force and form the legal basis for educational administration; a new Education Ordinance is being prepared. There are no racial, cultural or social restrictions affecting admission to schools.

The role of voluntary agencies in maintaining and running schools is considerable, although the Government now undertakes the main financial burden. The majority of these agencies are mission societies and churches recognized as educational units for purposes of administration and responsible to the Government for their educational work. They are under the general supervision of the Ministry of Education and receive grants in aid from the Government for the payment of teachers' salaries. In recent years local authorities have assumed increasing responsibility for primary schools, both financially and in management. Local authorities pay a small proportion of teachers' salaries and some run schools on their own, thereby ranking as educational units. There is thus a dual system existing where some schools are managed by mission bodies and a few by local authorities; the majority of local authorities exercise merely administrative control with actual management left to voluntary agencies.

In this pattern of divided responsibility advisory bodies play an important role. The Central Advisory Committee existed to advise the Government on matters of general policy, and although it has been abolished it may be replaced by a similar body or an *ad hoc* committee appointed at the discretion of the Minister from time to time. Similar committees to the old Central Advisory Committee existed at regional and at district level; these are now being replaced by committees of local authorities, as part of the increasing responsibilities local authorities are assuming for the control of education in their areas.

The Government's policy in education is embodied in the Accelerated Development Plan which was adopted in 1951 by the Legislative Assembly. It lays down the general structure of the school system, outlining official policies for the development of this system, and defines the respective roles of the Government, the educational units and the local authorities. The main aim of this plan was to provide a 6-year basic course for all children at public expense, although secondary, technical and higher educational extensions were also included.

Efforts have been made to relate the school system to the country's economic and social life; in recent years the need to relate the educational work to the ethnic and cultural background of the children has been more keenly felt with the achievement of independence, and syllabuses, curricula and textbooks have been revised with a view to greater realism in education.

Educational policies are executed by instructions from the central office of the Ministry of Education and Information in Accra. In 1950 a substantial measure of devolution was introduced by setting up Regional Education Offices, one in each administrative region. The Regional Education Officers or Assistant Directors of Education (as they were formerly called) in these regions were responsible for implementing the government's policy in education. There are now six educational regions as there are six administrative regions. On 6 March 1957 the Gold Coast territory became the independent State of Ghana. There followed a 2-year period of consolidation from July 1957

to June 1959. The 5-year Second Development Plan which is now being implemented was launched in July 1959. The principles underlying this plan are similar to those of the Accelerated Development Plan but the emphasis is now on provision of more facilities for secondary and technical education.

The diagram on page 595 shows the structure of the school system in Ghana. The aim of the 6-year primary course is to provide a sound foundation for citizenship with permanent literacy in English. This is followed by a 4-year middle school course during which selection tests are held for entrance to secondary schools. Pupils admitted to the latter take a 5-year course (forms 1 to 5) at the end of which they are eligible for selection to a 2-year sixth form course. While this 6+4+5+2 plan is broadly followed, the intention is to remodel the middle school so that it may be more suited to the needs of modern Ghana. It is hoped that pupils may in due course enter secondary schools directly after the sixth and final year of the primary school. At the moment pupils are selected for the secondary school after the second or third year in the middle school. Those children who do not enter secondary schools may proceed by selection to pupil teaching (thence to training colleges), to technical institutes or general employment. Educational opportunities for secondary leavers include teacher training and, for those with the Cambridge Higher Oversea Certificate, technological training and university studies. In 1959 the University College, which is in special relationship with, and prepares students for the internal degrees of the University of London, had faculties of arts, divinity, economics, sociology, natural science, and agriculture, an institute of education, and an institute of extra-mural studies.

THE DEVELOPMENT OF SECONDARY EDUCATION

Early educational efforts in Ghana were largely the result of missionary enterprise. In 1876 the first high school for boys was opened by the Methodist Mission, but this attempt at post-primary education did not achieve permanent success until 1909 when Mfantsipim School was formed at Cape Coast by the union of the Wesleyan Collegiate School and the Fanti Public School. A grammar school was established at Accra as a private enterprise but closed down in the early years of this century.

The Prince of Wales College, now known as Achimota College, was established by the Government in 1924, consisting of the teacher training classes of the former Government Training College, Accra. In 1927 kindergarten and lower primary classes were added, followed in 1929 by upper primary, secondary and university classes. There was therefore at Achimota a complete educational ladder from kindergarten to university, with teacher training for both men and women.

In 1930 the college ceased to be a government department and was given a constitution, control passing to a council with both government and non-government representatives. In 1944 the kindergarten and primary classes were discontinued, so that Achimota then comprised a secondary school with a pre-secondary year, a teacher training college and university classes; in the same year, the training college course was changed from a 4-year course to a post-secondary 2-year course. The training college staff and students were transferred to Kumasi College of Technology in 1951, thus forming the nucleus of the teacher training department of that institution.

An Educationists' Committee appointed in 1920 submitted a clearly defined and detailed policy for expansion of educational work, at a time when a great change in the fortunes and outlook of the people of the country made the need for such a policy vitally urgent. Another systematic review of the country's educational system and policy took place in 1937–41 when an official committee prepared long-term plans. The report of this committee was as much a milestone in the history of secondary education in Ghana as was its precursor in 1920. It recommended, *inter alia*, that the secondary school curriculum should be brought into closer correspondence with the national life and needs of the country; that the Government should exercise closer control over secondary education and provide greater financial assistance, including more scholarships; that more girls' secondary schools should be established to provide a basic general education as a foundation for advanced professional training in the fields of education, medicine and social work, to mention only a few.

Little could be done to implement these recommendations during the second world war, but much preparatory work was accomplished, including a series of education surveys carried out during 1944–47. The evidence gathered in the surveys as well as the recommendations of the committee were used for the formulation of a 10-year development plan after the war, resulting in a rapid growth of education since then. In particular there was considerable expansion after the introduction of the Accelerated Development Plan for Education in 1952. In 1951 there were 13 secondary schools within the public education system and this number rose to 39 by December 1958, viz., 1 autonomous (government-endowed) school with an independent council, 2 government schools (including 1 secondary technical school), 18 assisted schools (12 boarding and 6 day schools), and 18 'encouraged' schools. Encouraged schools are secondary schools established by private enterprise, and selected in 1952 and thereafter, after not less than 3 years' existence, for assistance from central government funds. Of these 39 schools, 13 are for boys, 6 are for girls, and 20 are co-educational.

Whereas, in 1951, 2,937 pupils were receiving secondary education in public secondary schools, this number rose to 9,860 in 1957, to 10,423 in 1958, and to 11,111 pupils (8,948 boys and 2,165 girls) in 1959. With the encouragement of the more efficient of the private secondary schools the number of private institutions remaining outside the public system has decreased. Of the 49 known private secondary schools in 1951, 19 had been placed on the list of encouraged schools by the close of 1959. According to annual returns received from other private schools, 30 were known to exist in 1959. These private schools receive no assistance from central or local government sources and information about them is unreliable.

The development of sixth form work. In 1949, sixth form work was started at Achimota School. By 1957, the number of secondary schools offering facilities for advanced study had

increased to 8, this number including the Kumasi College of Technology, where sixth form work was begun in 1953. In 1959, however, the course at the Kumasi College of Technology was stopped by a decision of the Cabinet, in order that the college might concentrate on engineering and technological courses. At present 11 secondary schools (5 boys', 3 mixed, 3 girls') provide sixth form courses. The number of pupils entering sixth forms has increased from 27 boys and 4 girls in 1950 to 251 boys and 26 girls in 1959.

The provision of adequate facilities and the expansion of sixth form work is important for the development of the University College of Ghana.

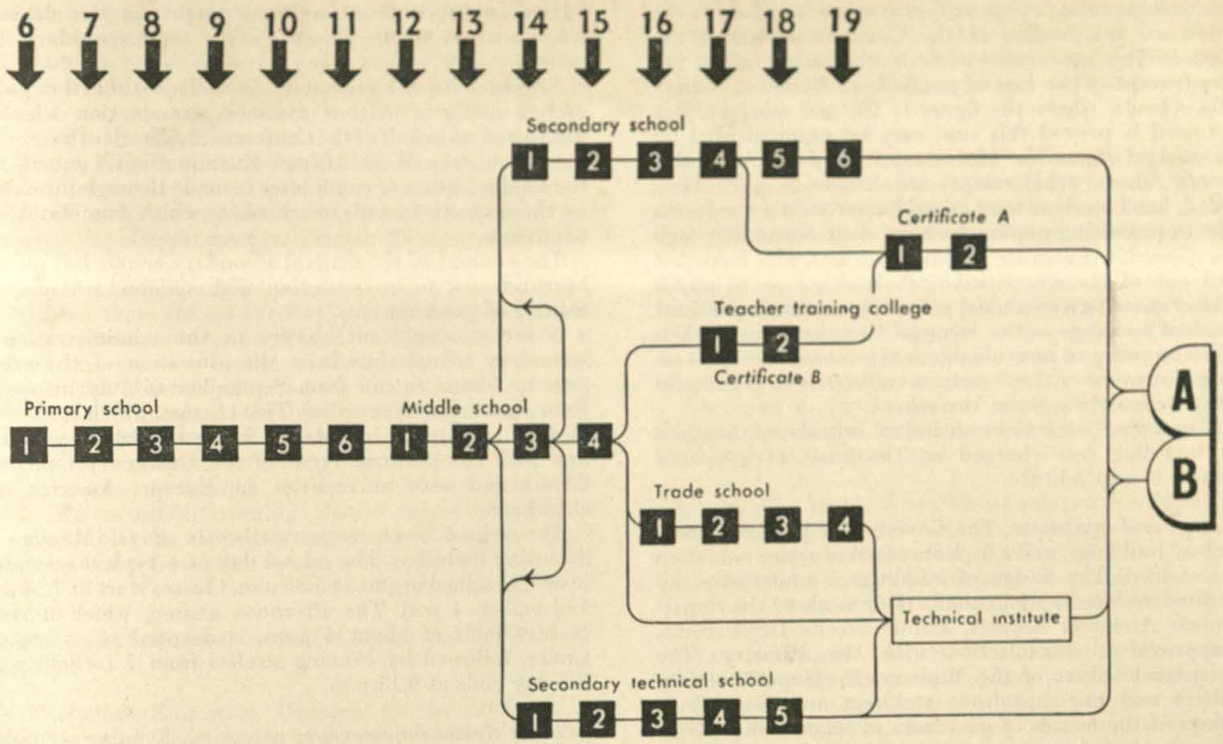
Administration

The Ministry of Education is responsible for the organization of secondary education provided in schools within the public system as well as for relations between the Government and bodies performing work of an educational nature related to secondary education.

Most secondary schools within the public system are managed by missions or churches recognized by the Ministry of Education and Information for the purpose, and to which grants are paid. These educational units are responsible to the Ministry of Education and Information for conducting their schools according to the Education Ordinance and the rules made under the ordinance. A number of secondary schools are also managed by boards of governors established under the ordinance as corporate bodies. These boards are similarly responsible to the Ministry of Education and Information. Heads of schools are the executive of the management of schools. Until 1959, the Central Advisory Committee on Education's Sub-Committee on Secondary Education and Associated Teacher Training dealt with all matters on secondary education referred to it by the Central Advisory Committee and on which the Minister wanted advice. A National Teacher Training Council was set up in 1958 and charged with the responsibility of advising the Minister on all matters relating to teacher training in Ghana.

Syllabus revision and control of examinations. The content of the courses followed in the secondary schools is largely determined by the requirements of the West African School Certificate examination and The Higher Oversea School Certificate examination of the University of Cambridge Local Examinations Syndicate. The former examination is organized and conducted by the syndicate in collaboration with the West African Examinations Council. In such subjects as Latin and mathematics the syllabus closely follows that of the Cambridge Oversea Certificate, but in other subjects where a West African environment is of importance panels of teachers have been set up and keep the syllabuses under constant revision. The University of Cambridge Local Examinations Syndicate has shown itself willing at all times to make changes in examination syllabuses consistent with the maintenance of its standards to meet specially West African problems.

The Ghana Schools Examination Sub-Committee of the West African Examinations Council is responsible for conducting examinations for the Higher School Certificate, the West African School Certificate or any school certificate that may replace it, Sixth Form Entrance, and the London General Certificate of Education. The committee formulates regulations having effect in Ghana for the examinations mentioned above, and appoints examiners, revisers, moderators and awarding committees. In addition, it sets up subject panels, receives reports from these panels and authorities for the introduction of new syllabuses for subjects in the examinations it conducts.



The West African Examinations Council has, however, complete control over the syllabuses for the School Certificate examination. Those in science particularly are under continuous review by panels on which the schools and subject associations are fully represented. These reviews have already dictated syllabus changes which will be implemented from 1960.

There is a need, however, to relate curricula and syllabuses more closely and purposefully to the economic, social and cultural conditions as well as the needs of the country. It is the Minister's intention to assign to a special committee the task of initiating a nation-wide investigation into this matter.

Textbooks. Textbooks used in secondary schools are selected by the head of each individual school in consultation with the specialist teachers in charge of subjects. Although the Ministry does not exercise any control over the selection of textbooks, it reserves the right of ensuring that books selected are in accordance with the syllabuses in use at the schools and are such as can be used to advantage by the pupils. Textbooks used in secondary schools are imported. With very few exceptions, textbooks written in the main Ghana languages are produced in the country. At the primary and middle school level, it is the view of the Minister that the problem of the supply of school textbooks should be tackled as soon as possible, and he has expressed his intention to set up a special committee to advise on the suitability of textbooks at present in use at these levels with special reference to the question of background.

Supervision and inspection. All secondary schools within the public education system are inspected by officers of the General Education Division of the Ministry of Education and Information. The function of the inspectorate, which is headed by the Principal Education Officer, Secondary Education, is to examine the work of the school with reference to syllabuses and curricula, and to ensure that these are followed. The inspectorate also satisfies itself that the textbooks in use are suitable, that the methods used are in accordance with modern educational thought and practice, and that the administration, discipline and the corporate life, accommodation and boarding arrangements are such as to warrant expenditure of public funds on the school. The members of the inspectorate submit reports on the subjects or aspects of the school work and life examined by them. These are collected as the official report on the school. The members of the inspectorate advise also on the methods and procedures which can help to achieve maximum results in the academic work as well as in the organization of the school generally.

Parents' committees are not a special feature of education at the secondary level. The graduate teachers' association, composed mainly of teachers in secondary schools and

GLOSSARY

Certificate A: see *teacher training college* below.
Certificate B: see *teacher training college* below.
middle school: lower general secondary school offering course with practical bias.
secondary school: general secondary school of academic type.
secondary technical school: vocational secondary school.
teacher training college: course for *Certificate A* open to secondary leavers or teachers with at least 2 years' practical experience after obtaining *Certificate B*; course for *Certificate B* open to middle school leavers who have had at least 1 year's experience as pupil teachers. Courses A and B may be provided in the same college or by separate institutions.
technical institute: vocational training school offering full-time, part-time and evening courses.
trade school (junior technical institute): full-time vocational training school.

HIGHER EDUCATION

A. Ghana University College (including an institute of education).
B. Kumasi College of Technology.

teacher training colleges, has shown active interest in secondary education, and the association makes representations and recommendations to the Ministry of Education on certain aspects of secondary education or on education in general as they affect secondary education.

Finance. The Government's financial responsibility for secondary schools is confined to teaching staff salaries and allowances, including passages for overseas staff and appointment expenses, and capital grants for developments and extensions. The costs of all other items are found from pupils' tuition fees (as distinct from boarding fees). Before 1958, pupils paid a flat rate fee of £12 per pupil annually; this has been replaced by an 'economic fee' determined by taking account of the total of general expenses, namely, salaries and wages of office staff, transport, books and equipment, furniture and building and other charges.

The management of each school decides, subject to the approval of the Minister, whether sixth-form pupils should pay a higher fee or not.

In the case of 'encouraged' secondary schools, where the schools are accommodated in rented buildings, government grants are not paid for rent of buildings or for maintenance of buildings—these are met from the fee income. Where funds permit, however, specific grants for extraordinary work are made.

Scholarships are awarded on merit, and the allocations to schools are made in proportion to the number of streams in each school. Payment is made annually by the Ministry of Education to the heads of schools.

Scholarships for a 4-year or 5-year secondary course are awarded on the results of the Common Entrance examination. The basic value of each scholarship is £30 per annum (except in the case of pupils from Northern Region middle schools, where the figure is £60 per annum); but where need is proved this sum may be supplemented by the award of bursaries. Moreover, from funds available after the above scholarships and bursaries have been awarded, head teachers may award bursaries to a maximum of £60 to promising pupils who have done reasonably well in the Common Entrance examination but who have not gained one of the competitive scholarships, or to pupils who after entering a secondary school are unable to continue because of a change in the financial circumstances of their families or owing to unavoidable fee increases. The government grant to cover these cases is calculated at the rate of £150 per class throughout the school.

The boarding sections in secondary schools are financed from boarding fees charged on the basis of approved estimates of expenditure.

Buildings and equipment. The Government provides funds for school buildings, and a high standard of accommodation is maintained. The design of buildings is undertaken by accredited architects who submit their work to the Superintendent Architect Schools, Public Works Department, for approval in consultation with the Ministry. The Development Officer of the Ministry, the Superintendent Architect and the consultant architect are co-opted to meetings of the boards of governors of schools and advise on the selection of contractors from among those who have submitted tenders. The recommendations of the board are submitted to the Ministry for approval, after which the Ministry applies to the Development Commission for funds.

In cases where schools are housed in temporary premises or where those in permanent buildings require additional accommodation, arrangements for tenancy agreements regarding privately-owned buildings are effected by the Commissioner of Lands on behalf of the Ministry.

Recommended areas have been laid down for rooms in secondary schools and training colleges: They include: general classrooms, science laboratories and lecture rooms, and libraries, 44 feet by 23 feet; large classrooms, e.g. for geography or English, and art and craft rooms, 1,200 square feet; dining rooms, 10 square feet per person; dormitories, 480 cubic feet per person; etc.

TYPES OF SECONDARY EDUCATION

Secondary (grammar) schools offer a course in general education leading to the West African School Certificate. Secondary technical education is provided at one school—the Government Secondary Technical School, Takoradi—a boarding school for boys which offers a 5-year course leading to the West African School Certificate. This institution, which was formerly the Government Technical School, has been renamed to indicate its new function. The school presented its first candidates for the West African School Certificate in December 1957.

There is no organization specially set up for giving advice or direction to pupils or parents in the choice of schools where pupils should pursue their secondary education.

Entrance to all secondary schools within the public system is by a written common examination which is conducted on behalf of the Conference of Heads of Secondary Schools by the West African Examinations Council, and the final selection of candidates is made through interviews by the respective heads of schools to which candidates seek admission.

The content of the general secondary course has already been referred to in connexion with syllabus revision and control of examinations.

A recent significant change in the administration of secondary schools has been the alteration of the school year in Ghana to run from September to July instead of from January to November. This change, which took effect in 1960, was made in order to bring the school year into line with the academic year of the University College of Ghana and with universities in Europe, America and elsewhere.

The school week is normally six days, Monday to Saturday inclusive. The school day at a typical secondary boarding school begins at 5.30 a.m. Classes start at 7.10 a.m. and end at 1 p.m. The afternoon session, which starts in most schools at about 4 p.m., is devoted to sports and games, followed by evening studies from 7 to 8.30 p.m.; the day ends at 9.15 p.m.

Evening classes for secondary education. Evening secondary schools, of which there are two in the country, recruit pupils who have completed the middle school course and who wish to continue their education but have had no chance of entering approved secondary schools. The courses provided at these schools are given in a less formal context and the curriculum and syllabus in general are based upon the requirements of the West African School Certificate. Some candidates, however, undertake the course to improve their general background without aiming at any examination.

Subjects taught include English, Latin, history, geography, mathematics, a Ghana language and religious knowledge.

Pupils are selected by means of a written examination organized by the supervisory body, followed by an interview. There is no age limit, but preference is given to candidates whose formal schooling ceased not more than eight years before the time of applying. Pupils already attending secondary school are not admitted. Private candidates who have completed their first and second forms in secondary schools are considered for entry into the appropriate form.

Vocational and pre-vocational studies are not included in the curriculum.

No particular methods are specified for teaching in evening schools, and the teachers, most of whom are graduates with previous professional experience, may adapt their methods to suit the type of pupils recruited. In the matter of guidance and direction, there is, as can be expected, a carry-over of the experience which the teachers have gained in their normal work as teachers in secondary schools to their teaching and general work at the evening secondary schools. All testing, reporting on pupils and

promotion are organized by the supervisor of the school in collaboration with his staff.

In addition to these evening classes, the People's Educational Association, a voluntary organization, organizes classes in various subjects for the general public in collaboration with the Extra-Mural Department, University College of Ghana, and arranges lectures, debates and discussions on subjects of general or topical interest on behalf of and in conjunction with various bodies, for instance, the Department of Social Welfare and Community Development. In addition, the association organizes evening classes for middle school leavers. Some of the pupils from these classes eventually enter the government evening secondary schools. These PEA classes follow a systematic syllabus towards a definite end, i.e., the pupils enter for the West African School Certificate or General Certificate of Education examination as private candidates or students of government evening secondary schools. The PEA does not compete with the government-sponsored evening secondary classes; it acts in conjunction with them. For instance, evening classes organized by the association play an especially important part in the rural areas where the Government has not yet established such classes.

Vocational and technical education under the Ministry of Education

The Technical Education Division of the Ministry of Education and Information organizes and operates a system of education and training which will produce sufficient skilled manpower, below university degree level, to meet Ghana's needs for the maintenance of existing works, services and industries and for the further development of the country.

The system designed to achieve this aim consists of programmes of education and training as follows:

Junior or pre-apprenticeship courses. Candidates are recruited from among pupils who have successfully completed the middle school.

The pre-apprenticeship courses are designed to offer to students who are below School Certificate standard a course of general education with a heavy technical bias. The subjects taught are English, mathematics, elementary science, geometrical and technical drawing, woodwork and metalwork. The end-of-course examination, set by the Ministry, is the entrance examination to craft courses and junior technical courses in government institutes.

Craft courses and advanced craft courses. The 2-year craft courses are designed to offer further instruction in English and mathematics and specialized instruction in the technologies and practices of the various crafts and trades. The entry to full-time craft courses is confined to candidates who have successfully completed junior or pre-apprenticeship courses, and is by competitive examination. The output from these courses enter industry and government departments to complete their apprenticeships and join the skilled craftsmen in the tradesmen and artisan grades.

The advanced craft courses are designed to offer further specialized instruction to craftsmen who are considered by their employers to be potential leading hands, charge hands and foremen. The instruction offered is beyond the level required for the average craftsman and the courses, which are full-time, cover 1 or 2 years, depending on the craft.

Technical courses. Students who have done exceptionally well in the examination set at the end of the pre-apprenticeship course may be admitted to a 1-year junior technical course in preparation for entry to a senior technical course.

Senior technical courses of 2 to 3 years' duration are designed to offer the technical knowledge and skill required by the technician who is the link between the technologist and the craftsman. Entry to senior technical courses is confined to holders of the School Certificate and to students who have successfully completed junior technical courses.

Advanced technical courses are designed to offer the additional technical knowledge and skill required by the high-grade technician.

Commercial subjects courses. These courses, provided at the government technical institutes, are designed to equip the students with sufficient skill in office arts and sufficient knowledge of commercial subjects to enable them to fill positions of responsibility in commerce and industry.

Courses in domestic subjects. The courses are dressmaking and needlework, domestic cookery and housecraft, and trade cookery. A combination of the last two courses forms an excellent training for young men and women who intend to enter any branch of the catering industry.

Special subject courses. These cover all courses which cannot conveniently be listed under one or other of the above headings. The courses are often designed for a specific need, e.g., a course in librarianship has been arranged in collaboration with the Ghana Library Board; a course in journalism has been arranged jointly with the Information Division of the Ministry of Education and Information; a course for examinations of the Institute of Bankers has been arranged at the request of local banks.

Technical teacher training courses. These are designed to produce technical teachers possessing a high standard of technical knowledge and skill and also a sound knowledge of teaching principles and methods. Entry is restricted to serving officers of the Technical Education Division of the Ministry and to candidates for future appointment to the Division.

Educational activities and training schemes of other ministries and departments

The following list is not exhaustive and in particular excludes numerous in-service training programmes and overseas courses.

Recruitment and Training Branch, Establishment Secretary's Office. Secretarial courses in shorthand, typewriting, office management, English and secretarial practice are provided in the government secretarial schools operating in Accra, Sekondi/Takoradi, Kumasi, Tamale and Koforidua. In

1957, 2,361 candidates, including non-civil servants, were examined for the various grades in the secretarial class. Candidates who successfully complete the courses and applicants who pass the school examinations are issued certificates of competency.

Ministry of Health. The basic training of nurses is carried out locally. Two midwifery schools operate at Kumasi and Accra. Schools of hygiene train health inspectors. Pharmacy scholars are trained at the Kumasi College of Technology. The Ministry of Health trains pupils for appointments as laboratory technicians, X-ray operators, assistant hospital welfare officers, leprosy control assistants and field assistants.

Ministry of Labour, Co-operatives and Social Welfare (Labour Division). Lectures in training-within-industry are given by an International Labour Organisation expert. This course is open to the general public.

The Youth Employment Section of the Division has a wide programme for vocational guidance, both in the urban and rural areas. Talks on traditional village occupations are given to pupils in rural areas. To supplement these talks, film shows on various topics relating to vocational guidance are given.

Ministry of Agriculture. Students are given a 3-year course at two agricultural training centres to qualify as agricultural assistants. Students attending these courses include teachers of the Ministry of Education and members of the Forestry Department. Learners from the Ministry of Agriculture are appointed Agricultural Instructors in the service of District Councils, on completing their training.

In the Cocoa Branch, Agricultural Survey Officers are given an initial training course at the Agricultural Training School, followed by one month's field attachment and a final month's instruction at Bunso.

Co-operatives Department. At the departmental training school in Accra, new management committees are taught the rudiments of the Co-operative Societies Ordinance and by-laws, general management of societies, and the conduct of meetings. At other courses, young men intending to be secretaries are trained, and established secretaries are given refresher courses.

Rural Water Department. This department operates training schemes for technical trainees and apprentices in the drilling, mechanical and civil engineering sections.

Public Works Department. Through its Training Division, the Public Works Department maintains departmental training centres at Takoradi and at Weija, near Accra. At the Weija Centre, both long and short courses are conducted in a variety of subjects, including surveying and levelling, storekeeping, plumbing, and road-building.

The Department also makes use of the training facilities offered by other institutions. Employees are sponsored for day-release and evening courses in commercial and pre-technical subjects at the Accra Government Technical Institute. Employees of clerical and executive grades respectively attend courses organized by the Civil Service Training Centre either in Accra or at regional centres. The Department also sponsors candidates for training at the Survey Department School, for a special mechanical course at the Kumasi College of Technology, and for a refrigeration course organized by the Army.

Survey Department. A 3-year post-School Certificate technical training course is given to pupil surveyors to qualify for appointment as Assistant Surveyors Grade II. In the drawing section, candidates are given training in lithography. At the Kumasi College of Technology, candidates undergo professional training for the Royal Institution of Chartered Surveyors examinations.

Local government training schools. These give effective training to local authority staff in public administration (local and central government), secretarial practice, English language, finance and accounts.

Electricity Department. The Department's training school trains apprentices for appointment in the Department. Apprentices in Accra and Takoradi are given in-service part-time training at the local government technical institutes.

Forestry Department. The Department has trained its own forest rangers for two decades. The new Forestry Training School at Sunyani provides full board and accommodation for 48 learners, efficient and modern facilities for class and laboratory work, and quarters for the teaching staff. The learners' course is of 3-years' duration, 2 years at the school and 1 in the 'bush'. Learners are selected from School Certificate holders by interview and examination and are given 3 months' field experience before they enter the school. On passing the final examination, they are appointed as forest rangers.

Geological Survey Department. This Department trains geological assistants, field assistants, draughtsmen, and drilling artisans for its own staff.

Fisheries Department. The Fisheries Department maintains a small school at Takoradi where fishermen, many of them illiterate, are taught the rudiments of seamanship and how to operate and maintain marine engines. In each case, certificates are awarded to successful students. Fishermen who purchase or charter a motor fishing vessel are trained to operate it and to fish by trawl, drag-net and hand-line. In the Northern Region, seven training camps are maintained at which local farmers are taught to weave and use cast nets and to make and set trot lines.

Broadcasting Department. School broadcasts were tried out experimentally in 1957. They included a full 8-week term broadcast to secondary schools and technical institutes. Subjects covered included pronunciation, spoken English, current affairs and singing. A similar term's broadcasts were also made for training colleges. As a result of these experiments, a regular service of broadcasts has been planned.

Ghana Information Services. The Information Services Department produces newspapers, books and booklets

and carries out widespread activities connected with informal education. Schools and members of the general public are kept informed of current events through the distribution of *New Ghana*, which has a circulation of 50,000. A large proportion of this publication goes to schools and colleges.

Of the over 2,100 films available in the film library, nearly half are circulated among schools and colleges and the other half among government departments (including Police, Prisons and Army).

The Bureau of Ghana Languages. The Bureau produces regular newspapers and booklets in the main Ghana languages. It also undertakes a large number of translations for educational institutions, government departments, commercial firms and other organizations.

Prisons Department. Schools are run for the benefit of the illiterate. Mass education methods have been introduced in almost every prison. A full-time teacher is on the staff of the Borstal Institution at Accra where school attendance is compulsory. New books and other reading materials, including primers in some of the main Ghana languages, are supplied to the prison libraries. No prisoner is restricted in his choice of books or the number he may read. The supply of reading materials is augmented periodically by the Ghana Central Library Services.

Teacher training schools

Teachers for primary and middle schools follow two types of training courses—the 2-year Certificate B course, which follows a middle school education, and a 2-year Certificate A course, which recruits students from the secondary schools and also from successful teachers who hold the B Certificate. Many teachers enter the teaching field as pupil teachers after their middle school course, and in 1954 10 pupil teacher centres were opened in order to provide a 6-weeks in-service training course for pupil teachers. The number of these centres is gradually being reduced as more training college places are provided.

Other specialized schools

Specialist courses in art, music, physical education, housecraft, were at first conducted in the teacher training department at Achimota College. In 1951 these courses were transferred to the Kumasi College of Technology but in 1958 the 2-year post-secondary courses in teacher training, art and crafts, rural science, music, physical education and housecraft were established in a separate post-secondary training college. Courses are now offered up to diploma level in music. Arrangements are being made to bring the physical education and housecraft courses up to diploma standard. A diploma course in art and crafts is now provided at Kumasi College of Technology.

Out-of-class activities

The prefect system affords the pupils a sound training in self-discipline and prepares them for integration into the social and cultural life of the community when they leave school.

School sports and games are significant features of secondary school life. The games played include association football, cricket, hockey, lawn tennis and netball. Athletic sports are encouraged and there is an annual inter-school meeting. Informal cultural education is fostered through school societies and clubs, for instance, dramatic society, Boy Scouts, and subject societies, e.g. geographical or historical societies which are affiliated to parent organizations at the national level.

TRENDS AND PROBLEMS

The problems of secondary education are naturally tied up with the expansion of educational facilities at all levels of education. However, the immediate task of the Ministry in respect of the secondary level is the provision of more secondary school places so that there will be room for approximately 10 per cent of the number of pupils in each of the six regions of the country who are potentially eligible to enter. The annual intake into government-aided secondary schools should be three times as large as the present intake. In addition, there must be appropriate sixth-form facilities in secondary schools which are already established. The shortage of sixth-form pupils, especially those who have reached acceptable standards in science subjects, has hitherto denied the University College and Kumasi College of Technology candidates of proper quality. The annual intake into sixth forms must therefore be increased by a proportionately greater figure than that represented by the increase in first forms intake into secondary schools. A certain amount of rehousing of secondary schools established in temporary premises is necessary—science subjects in particular have suffered as a result of poor accommodation.

Lack of suitable staff accommodation has sometimes been a handicap to recruitment, particularly of overseas staff. Linked with the provision of educational facilities is the concern of the Government for the education of the children of the increasing number of representatives from Commonwealth and foreign countries and from international organizations who are based at Accra. These children, by virtue of their previous education, are ready to pursue secondary schooling at the age of 11 or thereabouts.

The major problem which will face the schools in the Second Development Plan period, considering the expansion which the plan involves, will probably be that of staffing. In the interests of education and international understanding it is desirable that expatriates should continue to be employed in the field of education at the appropriate levels.

STATISTICS

Population (mid-year 1958 estimate): 4,836,000.
Area: 91,843 square miles; 237,873 square kilometres.
Population density: 53 per square mile; 20 per square kilometre.

Summary of school statistics, 1953–57. In 1957, total school enrolment (not including adult education) exceeded 620,000 pupils, being 13 per cent of the total population. Of these pupils, 76 per cent were in nursery and primary schools, 22 per cent in middle and secondary schools, 1.4 per cent in vocational and teacher training schools, less than 0.2 per cent in higher education. These figures are not comparable with those published in *World Survey of Education: II—Primary Education* since the method of classification has been changed. (In particular, middle schools were shown under primary education in the previous edition, but are now included in secondary education. Teacher training, previously combining secondary and post-secondary levels, is now shown separately for each level.)

The proportion of girls was 34 per cent in primary schools, 23 per cent in middle and secondary schools, 14 per cent in vocational schools, 28 per cent in teacher training schools, and 10 per cent in higher education. Women teachers were about 20 per cent of the teaching staff in the primary, middle and secondary schools. The average number of pupils per teacher was 31 in primary schools and 30 in middle and secondary schools.

Between 1953 and 1957, pupil enrolment as a whole increased by 28 per cent. The increase in primary schools was only 25 per cent, while it was 38 per cent in the middle and secondary schools and 29 per cent in the teacher training schools. Vocational schools doubled their full-time pupils during the same period. (See Table 2.)

Enrolment trends in secondary education, 1950–57. Enrolment in general secondary education (including middle schools) more than doubled between 1950 (66,122; 17 per cent F.) and 1957 (139,636; 23 per cent F.). Vocational schools, with less than 1,000 pupils in 1950, enrolled over 5,000 (including part-time) pupils in 1957. Teacher training schools, including secondary and post-secondary levels, had a total enrolment of 3,833 pupils in 1957 as compared with 1,777 in 1950.

Examination results in secondary education, 1953–57. Table 3 shows the number of middle school leaving certificates increasing between 1955 and 1956 but dropping again in 1957. The number of West African School Certificates increased almost continually between 1953 and 1957 (with a slight setback in 1956). The number of teachers' certificates, having reached a peak in 1955, declined somewhat in 1956 and 1957.

Educational finance, 1957/58. In 1957/58, total expenditure for education amounted to nearly 9 million Ghana pounds, equal to about £2 per inhabitant. Of this amount, three-fourths came from the ordinary budget of the Central Government and one-fourth from the Development Fund. Recurring expenditure, which accounted for 99 per cent of the total amount, was distributed by level and type of education as shown in Table 1C.

GREECE

THE EDUCATIONAL SYSTEM

Article 16 of the Greek Constitution defines the system of education. In particular, it lays down that:

'Education is a state responsibility and shall be imparted either at state expense or at the expense of the independent local government bodies.

'The aim of the teaching in all primary and secondary schools shall be to provide a moral and intellectual education and to develop the national consciousness of the pupils in accordance with the ideological directives of Greco-Christian civilization.

'Primary education shall be free and compulsory for all. The length of the period of compulsory education, which shall not be less than six years, shall be laid down by law.

'Higher educational establishments shall be responsible for their own administration, under state supervision, and their teaching staff shall have the status of civil servants.

'Citizens possessing their full political rights, and corporate bodies, shall be entitled, with government authorization, to open schools which shall be run in accordance with the Constitution and with existing legislation.'

With the exception of certain vocational schools administered by other ministries, education is under the authority of the Minister of Education, a member of the Council of Ministers, who is responsible to Parliament. Assisted by the Higher Council of Education, the Minister exercises general supervision, and decides policy matters including problems of educational administration related to ethnic, linguistic, cultural, religious, social and other questions. In the chief town of each province, the central education administration is represented by the local prefect and by inspectors who are assisted by a council of education. Each primary and secondary school has a committee of parents which provides for school needs (*scholiki eforia*) so far as educational materials and school buildings are concerned.

The structure of the Greek educational system is shown in the diagram on page 605.

THE DEVELOPMENT OF SECONDARY EDUCATION

In conformity with the growing desire of the Greek people for education, governments since 1900 have been actively concerned with increasing the number of institutions for general and technical secondary education, with improving school equipment and teaching methods and with developing the traditional system of education by adapting it to existing needs.

There are now a considerable number of public and private schools, distributed more or less throughout the country, which provide technical education. It is difficult to generalize about the structure of this teaching, since of its very nature it differs greatly according to the professions or trades for which it offers training. Moreover, it comes under more than one Ministry, and each of these Ministries has founded and subsidized schools in the field with which its activities are concerned.

The following institutions for technical or vocational training come under the Ministry of Education: commercial secondary schools, nautical secondary schools, schools of mechanical engineering, and numerous modern language schools. Those which come under other Ministries include private technical and industrial schools (Ministry of Industry), secondary schools for agriculture, forestry and fisheries (Ministry of Agriculture), schools for nurses (Ministry of Welfare), schools for officers and engineers of the mercantile marine (Ministry of Mercantile Marine), and training schools for apprentices (Ministry of Labour).

The basic laws which govern the various types of Greek secondary education are the following:

General education

Royal Decree of 31 November 1836, establishing the middle school (*hellinikon scholeion*) with a 3-year course and the classical secondary school (*gumnasion*) with a 4-year course.

Law 4373 (1929) modified this system, introducing the *gumnasion* with a 6-year course, the modern secondary school (*lykeion*) with a 6-year course, the 2-year classical secondary school, girls' high schools and girls' city schools with 3-year courses.

Law 770 (1937), extending the classical secondary school course to 8 years.

Law 1849 (1939), re-establishing classical secondary schools with 6-year courses, and

Law 2180 (1940), introducing a differentiation into secondary education after the fourth year, it being open to pupils to concentrate either on science or on the humanities.

Law 2545 (1940), establishing the relationship between private education and the Ministry of Education in regard, *inter alia*, to the organization and running of private secondary schools.

Laws 4376 (1929) and 4630 (1930), on the establishment and organization of university experimental schools (one at Athens and the other at Salonika). Each of these schools comprises a primary school and a secondary school.

Laws 1949 (1939) and 1823 (1951), on the unification of the status of secondary school teachers.

Law 916 (1943), establishing evening classes for working students under the supervision of classical secondary schools.

Laws 2197 (1920) and 3336 (1925), on the organization and running of commercial secondary schools.

Teacher training

Laws 4367 (1929) and 4619 (1930), on the establishment of a teacher training school for infant-school mistresses and Laws 5802 (1934) and 953 (1937) replacing the teacher training schools for masters and mistresses by pedagogical academies (*paidagogiki akademia*), entrants to which must have taken a classical secondary course (*gumnasion*).

Laws 5620 (1932) and 2509 (1940), on the physical education curriculum for secondary schools and Laws 4372 (1929) and 4619 (1930) on the organization of the higher teacher training school (*Didaskaleion Messis Ekpedeusseos*) for refresher training for secondary school science and literature teachers.

Technical and vocational schools

Laws 5197 (1931) and 28 (1936), on the organization of vocational and technical training.

Law 2395 (1940), on the establishment of a school for mercantile marine officers.

Laws 214 (1943) and 1785 (1951), on the establishment of two higher schools of domestic science.

Law 3088 (1954), on the establishment of nautical secondary schools (*nautika gumnasia*).

Lastly, the establishment, in the provinces, of 6 new schools —technical schools and schools of mechanical engineering (*scholai hypomichanikon*)—is at present under consideration.

Administration

The plan for the organization of secondary education is established and kept up to date by the Ministry of Education, with the assistance of the Higher Council for Education and the directorates of secondary, private and physical education. The Higher Council for Education reports to the Minister on all questions concerning curricula, teaching methods, school textbooks, etc.

The authority of the central education administration is exercised through the inspectors-general for secondary education. The country is divided into 20 regions, at the head of each of which there is an inspector-general, assisted by a council. The inspector is responsible for the inspection of schools and for attending to most of the administrative and pedagogical questions that arise. There are also two inspectors-general for private secondary schools, and one inspector-general for foreign schools and minority schools. As all the secondary inspectors-general hold university degrees in letters, 14 additional inspectors have been appointed, representing the other branches of knowledge (natural sciences, mathematics, religious instruction and physical training). This administrative structure, whilst leaving the central authorities with the last word in the supervision of education, is steadily reducing their administrative burden.

Directors of secondary schools are selected from teachers who have a record of at least 10 years' successful teaching

at the secondary level. They are chosen by the Minister from a list of names submitted by the Higher Council for Education.

The State assumes responsibility for all expenses relating to the salaries of the staff of public secondary schools, the construction of buildings and the provision of equipment. Secondary school pupils pay a fee, although a certain percentage of pupils in each public school is exempted from this payment. Secondary school pupils also pay a small annual contribution towards the upkeep of the school buildings and the provision of supplies. In each school there is a parents' committee which is responsible for administering the sums thus collected in the best interests of the school. There is also a national organization, 'The Pupils' Friend', whose aim is to distribute textbooks free to needy pupils.

Private schools receive no state subvention, although the Ministry of Education establishes scales of fees and staff salaries.

Problems concerning the size of schools, their sanitation, safety, lighting, etc., are dealt with by the directorate of technical services of the Ministry of Education, which issues necessary instructions.

School medical officers, supervised by the directorate of school hygiene of the Ministry of Education, are responsible for health services and for the medical inspection of both pupils and teachers.

Vocational and technical education. The administration of the majority of vocational and technical schools is entrusted to other bodies, in particular, the Ministries of Labour, Industry, Commerce, Mercantile Marine, and Welfare. Nevertheless, the length of courses, the subjects taught and, in general, all questions concerning the running and organization of vocational and technical secondary education, in both public and private institutions, are dealt with by the Vocational and Technical Council, which comes under the Ministry of Education.

Vocational and technical school inspectors are graduates of the universities, the Polytechnic School or the Higher School of Economic and Commercial Science; they are responsible for the inspection and administration of vocational and technical schools.

Assistance is given to the teaching staff by various private bodies (committees of parents, professional associations, technical committees, etc.).

TYPES OF SECONDARY EDUCATION

Any pupil who has completed the primary school course can sit for the entrance examination for a general secondary school (*gumnasion*), a full-time commercial secondary school (*emporiki scholi*), or a technical secondary school (*messi techniki scholi*).

Students who work during the day may take evening classes at the general secondary school, the commercial secondary school, or the technical secondary school.

The Ministry of Education has set up a school guidance office to assist pupils in choosing the type of secondary education which is suitable for them. At the conclusion of the secondary school course, pupils may elect to follow different branches of study—humanities, science, political science, technical sciences (at the Polytechnic School), economic and commercial science, agriculture (in a higher school of agriculture); or they may go on to a military school, the school for the mercantile marine, or a teacher training school.

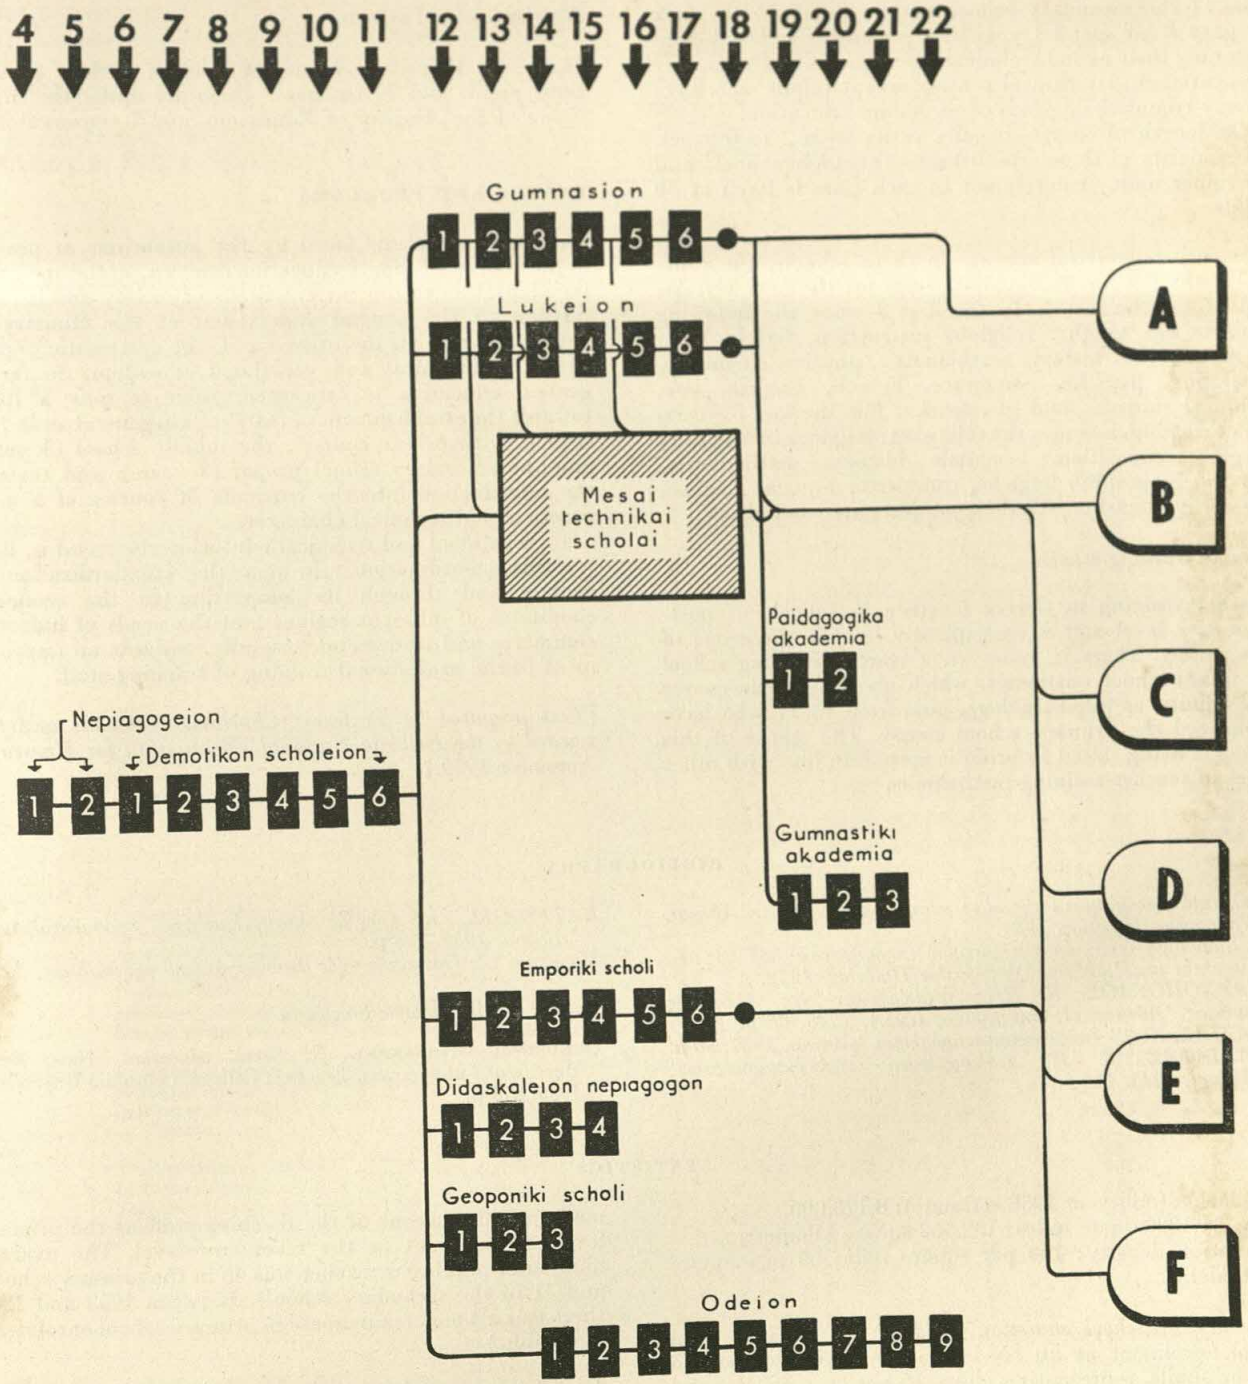
The school year begins on 5 September and ends on 10 July. It is divided into 2 half-years (September–January and February–June), each half-year being divided into 2 periods of 2 months each. There are written examinations, which must be taken by all pupils, at the end of each half-year. Pupils have 2 weeks' holiday at Christmas, 2 weeks at Easter and 2 months during the summer. Schools are closed also on the main religious and national holidays.

Secondary school pupils attend school 6 days a week for 6 hours each day.

General secondary schools

In the general secondary schools, the weekly time-table provides for 35 periods for first, second, third and fourth-year pupils, 36 for fifth-year pupils, and 37 for sixth-year pupils. The following subjects are taught: religious instruction, classical Greek, modern Greek, Latin, French, history, mathematics, physics, geography, domestic science (for girls), hygiene, technical subjects, singing, philosophy, civics (for boys) and gymnastics. All these subjects are compulsory.

Vocational and technical schools



The majority of these schools are open to pupils who have completed the primary school course or the first and second

GLOSSARY

demotikon scholeion: primary school.
didaskaleion nepiagogon: teacher training school for pre-primary teachers.
emporiki scholi: vocational secondary school of commerce.
geoponiki scholi: vocational training school of agriculture.
gumnasion: general secondary school with curriculum emphasizing classical Greek and Latin studies.
gumnastiki akademia: specialized teacher training college for teachers of physical culture.
lukeion: general secondary school with curriculum emphasizing sciences.
mesai technikai scholai: vocational secondary schools of various types.
nepiagogeion: pre-primary school.
odeion: vocational training school of fine arts or music.
paidagogika akademia: teacher training college.

years of the secondary school course. Pupils in the first category must spend 1 year in a preparatory class before beginning their actual technical training. A smaller number of vocational or technical schools accept pupils who have already completed 3 years of secondary education.

The length of courses usually varies from 2 to 6 years. The majority of these establishments are night schools, and the upper limit of enrolment in each class is fixed at 50 pupils.

Secondary commercial schools. In these schools, the timetable provides for 36 weekly periods for the first 3 years, and 37 for the last 3. In the first 3 years the following subjects are taught: religious instruction, Greek, composition, civics, history, mathematics, physics, chemistry, geography, hygiene, commerce, French, English, law, technical subjects, and gymnastics. For the last 3 years, the curriculum includes the following: religious instruction, Greek, composition, economic history, mathematics, physics, geography, hygiene, commerce, French, English, law and gymnastics. All these subjects are compulsory.

Teacher training schools

Teacher training in Greece is given in schools of post-secondary level and is consequently outside the scope of this survey. There is, however, a teacher training school for infant-school mistresses, which gives a 4-year course and admits, as pupil-teachers, girls from 13–17 who have completed the primary school course. The status of this school is being raised to bring it more into line with other types of teacher training institutions.

Other specialized schools

There are 40 privately-run art schools, with a total of 1,065 pupils and 99 teachers, which are under the supervision of the Ministry of Education, and 7 conservatoires.

TRENDS AND PROBLEMS

The major problems faced by the authorities at present in the field of secondary education concern, on the one hand, its adaptation to the current needs of society and its submission to the general supervision of the Ministry of Education and, on the other hand, the systematic organization of technical and vocational education. So far as general education is concerned, there is now a trend towards the establishment of two cycles in general secondary schools with 6-year courses, the middle school (3 years) and the secondary school proper (3 years), and towards the introduction into the curricula of courses of a more practical and technical character.

In vocational and technical education the trend is, first, towards co-ordination, through the standardization of courses and through its adaptation to the economic conditions of different regions and the needs of industry, commerce and trades and, secondly, towards an improvement in the professional training of teaching staff.

STATISTICS

Population (mid-year 1958 estimate): 8,173,000.
Area: 51,182 square miles; 132,562 square kilometres.
Population density: 160 per square mile; 62 per square kilometre.

Summary of school statistics, 1953–57. In 1957/58 total school enrolment at all levels may be estimated at 1.3 million pupils, representing about 16 per cent of the total population. Enrolment in primary day and night schools accounted for three-fourths of the total enrolment. Higher education enrolled less than 2 per cent of the school-going population. The proportion of girls was 48 per cent in the primary schools, 39 per cent in the secondary schools, and 25 per cent in higher education. Women teachers made up 48 per cent of the teaching staff at the primary level, 34 per cent at the secondary level. The average number of pupils per teacher was 46 in the primary schools and 31 in the secondary schools. Between 1953 and 1957 there was a 4 per cent increase in primary school enrolment. (See table.)

Examination results in secondary education, 1953–57. The numbers of secondary school certificates granted each year from 1954 to 1957 were as follows: 1954/55, 19,562 (F. 8,317); 1955/56, 18,719 (F. 8,223); 1956/57, 20,853 (F. 8,941); 1957/58, 20,122 (F. 8,822). In addition, for 1956/57, the numbers of certificates granted for various types of vocational education were as follows: technical, 5,753

(F. 124); commercial, 1,075 (F. 440); agricultural, 585 (F. 21); domestic science, 1,026 (all F.); social services, 1,073, (F. 613); art and music, 245 (F. 151); merchant marine, 130; ecclesiastical, 430.

Educational finance, 1957/58. For 1957/58, the budget of the Ministry of National Education amounted to approximately 1,126 million drachmas, averaging 139 drachmas per inhabitant. Official exchange rate: 100 drachmas = 3.33 U.S. dollars.

GUATEMALA

THE EDUCATIONAL SYSTEM

The Articles relating to education in the Constitution which came into force on 1 March 1956, are to be found in Section IV, Chapter IV. Special mention may be made of the following:

'The promotion and dissemination of culture in all its forms are a primary obligation of the State. The purposes of education are to develop human personality to its fullest extent, to inculcate a respect for the rights of man and for his fundamental liberties, to bring about physical and spiritual improvement, strengthen the sense of responsibility of the individual citizen, promote civic progress and heighten patriotism' (Article 95).

'Freedom of instruction and of teaching is guaranteed. Religious instruction in official establishments shall be regulated by law; the State shall not impart such instruction, which shall be optional' (Article 97).

'Every person has a right to education. Technical and vocational education is open to all on equal terms.

'The State shall maintain and increase as far as possible establishments of secondary education; technical, industrial, agricultural, and commercial institutions; pre-vocational schools; academies; centres of artistic culture; libraries and other institutions useful for cultural purposes' (Article 100.).

'The State shall provide scholarships for advanced study or specialization for students who because of their vocation, abilities and other merits are deserving of such assistance' (Article 101).

THE DEVELOPMENT OF SECONDARY EDUCATION

The development of secondary education has been particularly marked during the present century and there have been frequent changes and reforms. Three important meetings of educators, the Convention of Santa Ana, the First Seminar on Secondary Education in Central America and Panama, and the First National Educational Congress all played a large part in giving general and vocational secondary education their present structure and content.

The Convention of Santa Ana. In 1945, school teachers from Guatemala and San Salvador met to draw up curricula for all levels of education with the exception of higher education. Among other measures this convention recommended the organization of secondary education in two study cycles, of which the first, the lower general secondary course (3 years), was intended to provide a grounding both for a 2-year course in teacher training and for the academic course, also 2 years, leading to the *bachillerato* or university

entrance examination. This lower general cycle was not included in commercial, industrial, agricultural or similar types of vocational education. Reorganization on these lines was begun in 1947 and the new study plan was introduced by stages, starting with pupils in the first grade, and remained in force until last year.

The First Seminar on Secondary Education in Central America and Panama. The Executive Board of the Union of Latin American Universities, with headquarters in Guatemala, suggested that the Ministry of Education of the Republic of Honduras assume responsibility for sponsoring and organizing this seminar. Its terms of reference were to study and examine the problem of secondary education in Central American countries and the Republic of Panama with a view to making recommendations to the participating countries on the reforms and amendments required for raising educational levels so as to bring them into line with up-to-date educational ideas. The Ministry of Education of Honduras agreed to organize the seminar, which was held at Tegucigalpa D.C. from 7 to 18 March 1953, with the participation of representatives from each of the six countries. The conclusions reached were embodied in the form of recommendations relating in particular to:

1. The adoption of the term *enseñanza media* (intermediary education) for what had previously been known in these countries as *enseñanza secundaria*, *enseñanza post-primaria* or *enseñanza liceana*.
2. The general and specific aims of secondary education.
3. Its organization in two cycles, the first of which—the pre-vocational—was to cover 3 years, with the object of continuing the general education given at the primary level, discovering a pupil's special interests and aptitudes, and guiding him towards the profession or manual or other occupation for which he was best fitted. The second cycle, the vocational, was to be of varying duration depending on the nature of the specialized studies the student wished to take up.
4. The integration of secondary with university studies.
5. The training of secondary school teachers in Central America and Panama—a matter to be brought to the special attention of the universities.
6. The systematic organization of educational and vocational guidance services in secondary schools.

The First National Educational Congress. This was held from 31 January to 6 February 1955. As regards secondary and vocational education, the main recommendations were:

1. That secondary education should comprise two cycles: (a) *General*, lasting for 3 years, in which both basic and optional subjects would be included, and which would not only extend the general education begun in primary school but would also give an opportunity for the discovery of the pupil's aptitudes and interest. (b) *Diversified*, providing training for those proposing to go to a university, become urban or rural primary school teachers or teachers in pre-primary schools, specialize in the plastic arts, music or physical training, or qualify for careers in commerce, industry, agriculture, etc.
2. That responsibility for teacher training at this educational level should rest with the Arts Faculty of the University of San Carlos de Guatemala.

Administration

Government Decree No. 558, the Organic Law on National Education—which is the basic legal text on educational matters throughout the country—came into force on 25 February 1956. Under this law general and vocational or technical education are the responsibility of the Department of Secondary Education and Teacher Training and of the Department of Vocational and Technical Training respectively. Both departments are headed by directors who are appointed under conditions of open competition. They are assisted by inspectors and administrative staff and collaborate with other appropriate technical and administrative bodies. The Director of Secondary Education and Teacher Training is responsible for both public and private secondary schools, irrespective of whether their work lies in the pre-vocational field or is concerned with the various courses leading to the university or the training of pre-primary, urban or rural primary or nursery school teachers. The Director of Vocational and Technical Education is responsible for vocational and technical training establishments of various types providing training for industry, commerce or the home, and in agriculture, nursing, social welfare, the plastic arts, music and singing, dramatics, military science, public administration, etc. These two departments issue instructions and regulations, and take any other measures necessary for the smooth functioning of the educational system.

Buildings and equipment. Secondary schools are generally accommodated in publicly owned buildings, but private buildings are sometimes used. Owing to the country's financial circumstances, it has not yet been possible to provide sufficient buildings to house all the secondary or vocational schools required, and this is one of the most urgent problems of national education, not only at secondary but also at pre-primary and primary levels. A Committee for School Building, on which the State, municipalities and the private citizens of the locality are represented, has now been set up and good results are anticipated from its activities.

School welfare services. The Ministry of Education has for many years provided scholarships for students at secondary, vocational or technical schools, the number of which varies with the depth of the state's purse. The conditions governing this type of scholarship are laid down in Government Resolution No. 578, Regulations for Secondary School Scholarships. Article 2 of these regulations provides that secondary school scholarships shall be awarded to enable pupils to begin or continue their general studies (pre-vocational education), and to enable them to begin or continue courses in teacher or vocational training. Over the last few years the number of scholarships granted by the State for secondary or vocational studies has increased considerably.

Pupil guidance, both educational and vocational, was introduced into secondary schools in February 1957, under a special department of the Technical Council on National

Education. The fundamental principles on which this service is organized are laid down in a document entitled 'Draft Programme for Educational and Vocational Guidance'. The emphasis is on meeting the pupil's educational needs and, in so doing, to help him to develop his personality and to guide him towards the sort of life to which he seems best adapted.

The headquarters staff of this service includes a director-general, who is in complete charge, a supervisory director, a psychologist, a doctor, a nurse, a welfare worker (female), and specialized inspectors.

In the schools where it exists, pupil guidance is in the hands of a programme director who is also the headmaster, and a guidance committee consisting of the director and deputy director, a technical adviser, the teaching staff and psychologists (where there are any), the school medical officer and the nurse.

Owing to the shortage of trained staff and the limited funds available, pupil guidance was first introduced into some secondary schools in the capital and in one or two provinces (*departamentos*). These schools served as pilot projects, from which the range of the service's activities has been gradually but effectively extended.

TYPES OF SECONDARY EDUCATION

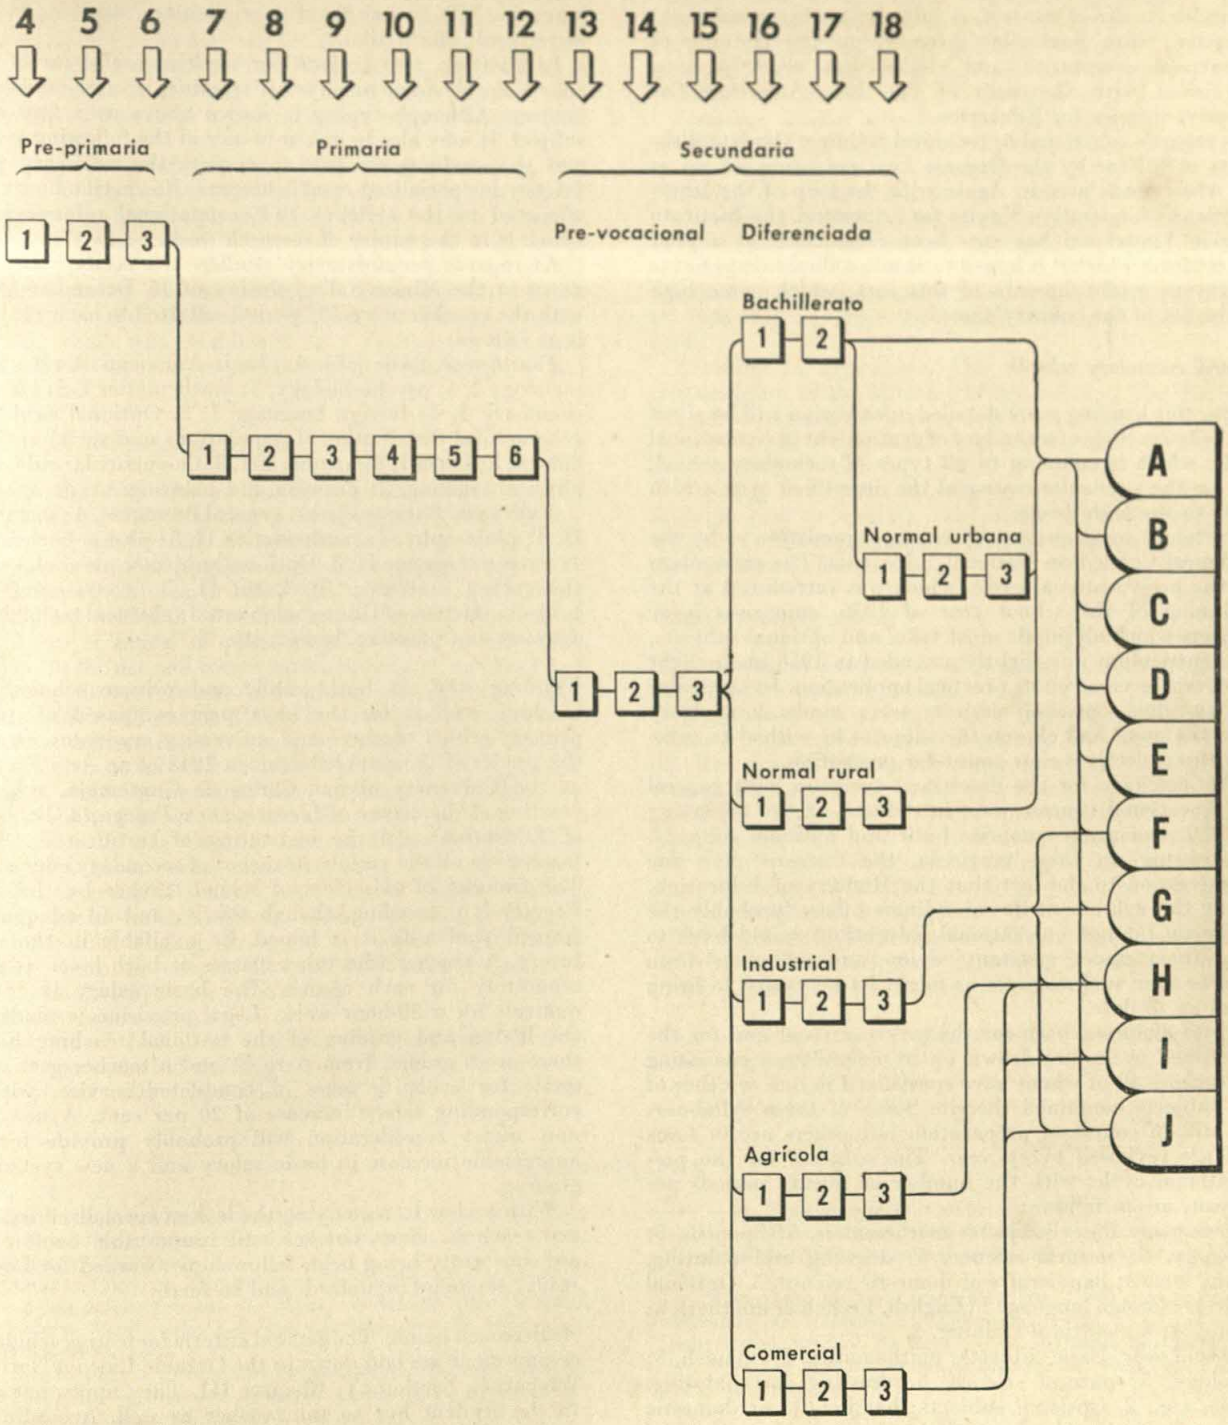
The purposes of secondary education are set forth in the Organic Law on National Education as follows: (a) to meet the requirements of the student's education, and in so doing to help him to develop his personality and to guide him towards the occupation in life to which he seems best adapted; (b) to continue as a natural process the education begun at primary level to prevent the student's having doubts as to his ability to cope with the work in any particular branch of instruction; (c) to explore the student's bent and aptitudes with a view to influencing him in the direction of either practical, artistic or academic activities, and encourage him to make the best use of the educational facilities offered him at specialized institutions or universities; (d) to bring the student up to an adequate level of general culture and provide him with a liberal education; (e) to give young people a suitable preparation for taking an active part in the planning and development of a society, capable of satisfying the material and cultural needs of the population; (f) to cultivate and develop the moral qualities needed by the student for the development of a balanced personality and to enable him to become a useful member of society; (g) to create and foster a love for his country; (h) to promote the acquisition of a healthy outlook and habits; (j) to enable the student to follow the social and economic development of Guatemala so that on entering public life he may contribute to its improvement.

Article 3 of Government Decree No. 510 of 29 December 1955 provides that secondary education shall consist of two cycles: the first, extending over 3 years, is pre-vocational (general) and compulsory for all students wishing to obtain a certificate or diploma recognized by the State; the second is diversified and of varying length, depending on the scope of the course of study undertaken or the degree of professional competence the student wishes to attain.

To qualify for admission to secondary education, candidates must have completed the sixth grade of primary school; on completion of the pre-vocational cycle they are given a certificate which entitles them to enter for any of the study courses of the diversified cycle. For public secondary schools the minimum entrance fee is 1.50 quetzals per pupil.

Secondary schools may be public or private. In public schools education is free but not as yet compulsory, although the Organic Law envisages the general implementation of a pre-vocational or general course comprising 3 cycles or 9 years of study, at which attendance shall be compulsory. Pre-vocational or general secondary schools have of late been established in nearly all provincial capitals.

Private general or vocational secondary schools are allowed to function in the country provided they meet the requirements of the relevant section of the Organic Law. They are supervised by the Ministry's special inspectors. On completion of the diversified cycle, certificates or diplomas are granted which are recognized by the State, provided the preceding course of study conforms to the syllabuses and curricula issued by the Ministry of Education. Most secondary schools, whether public or private, are day schools, but there are some night schools, for the most part state maintained.



The Organic Law provides for the establishment of experimental schools (*escuelas de ensayo*), but so far the Ministry has authorized only two private establishments to function as schools of this type; these establishments

GLOSSARY

agrícola: agricultural course.
bachillerato: upper cycle of general secondary school.
diferenciada: upper cycle of secondary education, differentiated into general, vocational and teacher training courses.
comercial: commercial course.
industrial: technical course.
normal rural: rural teacher training.
normal urbana: urban teacher training.
pre-primaria: pre-primary education.
pre-vocacional: lower general secondary course common to all types of secondary education.
primaria: primary education.
secundaria: secondary education.

HIGHER EDUCATION

A. Faculty of Medicine (8 years).
B. Faculty of Dentistry (6 years).
C. Faculty of Chemistry and Pharmacy (6 years for pharmaceutical chemistry or biochemistry, 5 years for chemical engineering).
D. Faculty of Arts (4-year courses in philosophy, psychology, history, literature, education, library science, journalism).
E. Faculty of Veterinary Science (6 years).
F. Faculty of Architecture (6 years)
G. Faculty of Law and Social Sciences (6 years for each course).
H. Faculty of Agriculture (6 years).
I. Faculty of Engineering (6 years).
J. Faculty of Economics (5 years).

are under its direct control. A pilot centre for commercial education, with particular reference to the training of commercial secretaries and clerks, has recently been established with the help of the Inter-American Co-operative Service for Education.

As regards vocational or technical training, the establishments called for by the Organic Law are being set up as and when funds permit. Again with the help of the Inter-American Co-operative Service for Education, the Instituto Técnico Vocacional has now been established as a pilot project from which it is hoped to obtain valuable experience for future establishments of this sort, which come high on the list of the country's needs.

General secondary schools

Under this heading more detailed information will be given on the lower cycle of secondary education, the pre-vocational cycle, which is common to all types of secondary school, and on the particular course of the diversified cycle which leads to the *bachillerato*.

Curricula are drawn up by expert committees or by the Technical Council on National Education. The curriculum for the pre-vocational cycle, which was introduced at the beginning of the school year of 1956, comprises basic subjects which all pupils must take, and optional subjects. This curriculum was slightly amended in 1958 in the light of reports received on its practical application. In particular the so-called optional subjects were made compulsory once the pupil had chosen the subjects he wished to take, and these electives now count for promotion.

The curricula for the diversified cycles in both general and vocational courses were introduced at the beginning of 1959, and again comprise basic and optional subjects. In drawing up these curricula, the framers gave due consideration to the fact that the Ministry of Education, acting through one of its subordinate offices (probably the Technical Council on National Education) would have to keep them under constant review and introduce from time to time such changes as might be necessary to bring them up to date.

The syllabuses, both for the pre-vocational and for the diversified cycle, are drawn up by committees consisting of teachers all of whom have specialized in one or other of the subjects contained therein. Some of these syllabuses are still in course of preparation but others are in force and are reviewed every year. The subjects for the pre-vocational cycle, with the number of weekly periods per subject, are as follows:

First year. Basic subjects: mathematics, 5; Spanish, 5; sociology, 5; natural science, 5; drawing and painting, music, etc., 2; handicrafts or domestic science, 5. Optional subjects: foreign language I (English, French or another), 4; typing, 4; agricultural training, 2.

Second year. Basic subjects: mathematics, 5; Spanish, 5; sociology, 5; natural science, 5; drawing and painting, music, etc., 2. Optional subjects: handicrafts or domestic science, 5; foreign language II, 4; hygiene, 3; secretarial work, 2.

Third year. Basic subjects: mathematics, 5; Spanish, 5; sociology, 5; natural science, 5. Optional subjects: book-keeping, 3; drawing and painting, music, etc., 2; foreign language III, 4; handicrafts or domestic science, 5; occupational information.

In addition, two periods per week in each year of the course are devoted to physical training, as a co-curricular subject. Although typing is shown above as a first-year subject, it may also be taken in any of the following years, and the students are free to acquire the necessary proficiency in specialized establishments. No specific hours are allocated in the syllabus to 'occupational information', which is in the nature of research work.

As regards pre-university studies, the study plan laid down in the Ministerial resolution of 15 December 1958, with the number of weekly periods allotted to each subject, is as follows:

Fourth year. Basic subjects: Latin American literature, 4; sociology I, 4; psycho-biology, 5; mathematics I, 5; physio-chemistry I, 4; foreign language I, 3. Optional subjects: geographical distribution of populations and social anthropology, 3; Latin I, 3; handicrafts, 3. Co-curricular subjects: physical training, 2; drawing and painting, music, etc., 2.

Fifth year. Basic subjects: general literature, 4; sociology II, 4; philosophy, 4; mathematics II, 5; physio-chemistry, 4; foreign language II, 3. Optional subjects: psychology, 3; elementary statistics, 3; Latin II, 3. Extra-curricular subjects: history of Guatemalan art, 3; physical training, 2; drawing and painting, music, etc., 2.

Teaching staff. In both public and private schools the teaching staff is for the most part composed of urban primary school teachers and university graduates. One of the results of the establishment in 1945 of an Arts Faculty at the University of San Carlos de Guatemala, was the creation of the degree of *Licenciado en Pedagogía* (Bachelor of Education) and the institution of certificated school teachers in all the various branches of secondary education. The training of this class of school teacher by the Arts Faculty is proceeding, though slowly, and an adequately trained staff will, it is hoped, be available in the near future. A teacher who takes classes at both levels is paid separately for each course. The basic salary is 150.00 quetzals for a 30-hour week. Legal provision is made for the listing and grading of the national teaching body: there are 6 grades, from A to F, and a teacher goes up 1 grade for every 5 years of completed service, with a corresponding salary increase of 20 per cent. A new law now under consideration will probably provide for an appreciable increase in basic salary and a new system of grading.

With a view to remedying the lack of specialized secondary teachers, short courses and round-table conferences are constantly being held, fellowships awarded for foreign study, seminars organized, and so forth.

Achievement testing. The general criteria for testing scholastic achievement are laid down in the Organic Law on National Education, Section IV, Chapter III. They apply not only to the student but to the teacher as well. According to Article III of this law, the mechanics of achievement testing include: psycho-pedagogic and sociological record cards, general intelligence and specific aptitude tests, tests designed to reveal the causes of backwardness, criteria for judging general progress, objective achievement tests,

questionnaires and criteria for assessing vocational aptitudes and personality development, statistical methods for the quantitative assessment of scholastic achievement, etc. This system also allows for extra tuition for backward students, classes for handicapped children, summer schools, vacation courses and other activities with the same end in view.

As regards secondary and vocational education, the framing of the tests, criteria and directives relating to the assessment system is entrusted to the heads of Departments of General and Vocational Education working in close co-operation with the Assessment Section of the Department of Psycho-pedagogic Investigation of the Technical Council on National Education. This assessment section, which was established on 1 February 1958, comprises four experts in psychometry, a statistician, and clerical staff.

Vocational and technical schools

The specific aims are to raise the general cultural level of the students, while teaching them to appreciate the dignity of manual labour and occupations useful to society; to inculcate habits of hygiene and safe working; to provide the necessary training to enable the student to earn a living as a skilled workman or technician; to lay the foundations for higher technical or professional studies; to train the student in the use and conservation of natural resources and encourage improvements in working methods and techniques which will enable him to be successful in the arts or industry; and to form reserves of human capital for the country's economic and social life on the basis of general culture, while at the same time training the student for some branch of production of value to the country.

Article 67 of the Organic Law envisages the following types of schools: industrial institutes, domestic science schools, commercial schools, agricultural schools, nursing schools, social welfare schools, plastic art schools, schools for music and singing, dramatic art schools, schools for military training, schools for public administration, and other schools still to be established.

Already functioning are:

The Central Industrial Institute. This institute offers a 3- to 4-year technical training course, following the general cycle of secondary education, and a special in-service training course for skilled workmen, established under special agreements with industry. They are for varying periods and are held in the evening or at night. Tuition is given in such subjects as mechanical engineering, woodworking, electro-technics, the graphic arts and textiles.

Domestic science schools. The main function of these schools is the training of domestic science teachers (female) in accordance with an experimental 2-year programme following the general course.

Commercial schools. Commercial studies are carried out at both public and private institutes at different educational levels. There is, for instance, a 2-year course for commercial secretaries and a 3-year course for accountants, all following on after the general secondary educational cycle.

Training in agriculture. This is the almost exclusive responsibility of the Ministry of Agriculture. The National School of Agriculture takes sixth grade primary school pupils who, after successfully completing the 5-year course, are accorded the title of 'agricultural expert'.

Training in the arts. Schools providing tuition in music (instrumental or choral), the plastic arts (painting and sculpture), dancing, dramatics and declamation come under the Ministry of Education.

Teacher training schools

The training of teachers is carried out in both urban and rural teacher training schools.

The revised curriculum for the training of teachers for urban schools represents a substantial departure from the previous system. The former programme of 3 years' general tuition, followed by 2 years' vocational training, is being gradually changed to 3 years' pre-vocational education (general) followed by 2 years of study for the *bachillerato* and then 2 years' vocational training, or 7 years in all. A start was made with the new programme in 1956 and it is being introduced by stages.

The rural teacher training schools have been reorganized, and the present curriculum comprises 3 years' vocational training, following the 3-year general cycle.

STATISTICS

Population (mid-year 1958 estimate): 3,546,000.
Area: 42,042 square miles; 108,889 square kilometres.
Population density: 84 per square mile; 33 per square kilometre.

Summary of school statistics, 1953–57. In 1957, the number of pupils enrolled from the pre-primary up to and including the secondary level of education was over 272,000. If university enrolment be assumed to be about 4,000 (3,379 students were enrolled at the San Carlos University in 1954), total enrolment may be estimated as about 8 per cent of the total population. Enrolment in kindergartens was approximately 5 per cent of the total; primary school enrolment, 86 per cent; secondary school enrolment, 7 per cent; university students, 1.5 per cent. The proportion of girls was 44 per cent in primary schools, 39 per cent in general secondary schools, 41 per cent in vocational schools, and 49 per cent in teacher training schools. Women teachers made up about two-thirds of the teaching staff in primary schools, where the pupil-teacher ratio (including part-time teachers) was 27. Between 1953 and 1957, enrolment increased by 27 per cent in the primary schools and by 16 per cent in the secondary schools. (See Table 3.)

Enrolment trends in secondary education, 1950–57. Table 1 shows a doubling of the enrolment in general secondary schools between 1950 and 1957, but a drastic reduction of the vocational school enrolment after it had reached a high level in 1955. Enrolment in teacher training schools increased by 37 per cent over the same period. Average total enrolment of all types of secondary schools was slightly over 5 per cent of the estimated population 15–19 years old.

Examination results in secondary education, 1953–57. There was an increase each year in the number of certificates granted, as shown in Table 2. Altogether more girls received certificates than boys; thus in 1957, girls received 62 per cent of all certificates. The only categories in which boys received all or practically all the certificates were the diplomas of technical industrial schools (25 certificates, all boys) and the diplomas of teacher training schools for rural primary school teachers (49 certificates, of which 47 to boys).

Educational finance, 1957/58. In 1957/58, the total budget for public education amounted to 11,939,930 quetzals, an average expenditure of 3.5 quetzals per inhabitant. Official exchange rate: 1 quetzal = 1 U.S. dollar.

1. In addition, there were kindergarten classes attached to primary schools.
2. Including part-time teachers.
3. Including enrolment in the first 3 years provided in urban teacher training institutes.
4. Schools of lower stage (*prevocacional*) only.
5. Teachers of lower stage only.
6. Not including enrolment in private schools of fine arts.
7. Including personnel teaching in general education courses provided in urban teacher training institutes.
8. Post-secondary level.

GUINEA

Before becoming an independent State in 1958, Guinea formed part of French West Africa, and the educational system established there was similar to that of the other territories composing the federation.

The Constitutional Law of 10 November 1958 recognizes the right of every citizen of the Republic of Guinea to education. In July 1959, the Council of Ministers adopted an order for the reform of education. The following text is based on the provisions of this order.

THE EDUCATIONAL SYSTEM

All educational establishments in the Republic of Guinea come under the authority of the Ministry of National Education. All educational questions of national importance are submitted to the Higher Council of National Education.

Education is, in principle, compulsory for all children and adolescents from 7 to 15 years of age. The Order of July 1959 provides that all adolescents who cease, at 15 years of age, to receive ful-time education shall take continuation courses. These courses, which can be taken either at night schools or by correspondence, focus upon general culture and vocational training and are instituted in keeping with national needs.

Education at all levels is provided free of charge; during the period of compulsory schooling, school supplies are also furnished free of charge.

The language of instruction in all state schools is French.

Primary education is intended, in principle, for children from 7 to 13 years of age. The first cycle (3 years) is for children between 7 and 10, and the second cycle (also 3 years) for children between 10 and 13. Primary education may be preceded by a fairly short period of pre-primary education, given in the kindergartens, nursery schools and infant classes attached to the primary schools.

Secondary education extends over 6 years. It comprises two cycles of equal length: a first, known as the 'orientation' cycle, and a second, the 'specialization' cycle.

In 1959, Guinea had as yet no national university, and students wishing to pursue university studies were sent abroad, more particularly to Dakar or to France. Holders of the *baccalauréat* are directed either to the higher vocational schools or to higher educational establishments.

The purpose of the higher vocational schools is to train, in 2 or 3 years, specialized technicians and supervisors. The best pupils from these schools can go on to higher education.

THE DEVELOPMENT OF SECONDARY EDUCATION

Administration

The secondary level institutions in Guinea when the country achieved its independence were the boys' *lycée*, the girls' *collège* and the *collège technique*, all at Conakry, the teacher training school (*école normale*) at Kindra, *cours complémentaires*, junior teacher training courses (*cours normaux*) and various vocational schools.

Principals and assistant principals are appointed by decree, on the proposal of the Minister.

In all questions relating to material and financial management, the principal is assisted by a board of management, which can also offer advice and make recommendations on educational questions. The board consists of the principal, the assistant principal, the bursar, representatives of the local authorities and government services (mayor or district head), representatives of the elected assemblies, representatives of the trade-union organizations and representatives elected by the school staff.

The principals and the secondary and technical school inspectors keep a check on the assiduity and competence of the teaching staff. The secondary and technical school inspectors are chosen among the teachers and continue to teach.

Secondary school scholarships are granted to children of families with slender means. Pupils of the primary teacher training institutes who sign an undertaking to teach for at least 10 years receive scholarships to cover their entire education.

Secondary school pupils either live out under supervision, or are day-boarders or full-time boarders. The day-boarders and full-time boarders pay their boarding fees to the school bursar at the beginning of each term.

Pupils of the National Secondary Correspondence School pay only the costs of the correspondence and school supplies. The most deserving of them may receive state assistance if their circumstances justify it.

TYPES OF SECONDARY EDUCATION

Secondary education is intended as a general rule for young people between 13 and 19 years of age. It provides them with a complete general training designed to foster the all-round development of their intellectual faculties in preparation for the exercise of an occupation for which they are specially trained; for admission to a higher vocational school for the training of medium-grade technicians and supervisors; or for admission to an institution of higher education, where they can receive a specialized scientific or technical education.

On the completion of their primary education, when they take a preliminary test of aptitude (*examen d'orientation*), pupils pass into the first cycle of secondary education where, for 3 years, they receive a standard basic education, including practical work which varies slightly according to their presumptive bent. The final decision as to the kind of work they are suited for is not made, however,

until the end of the first cycle, when they take the examination for the *brevet d'études du premier cycle* (BEPC) (first-cycle secondary certificate). This basic course comprises a study of Negro-African literature and literature in general, mathematics, science, physical culture, civics, moral instruction, artistic training, and an introduction to the world of production and to social work.

The second 'specialization' cycle, which also lasts 3 years, comprises a vocational and apprenticeship section, and a theoretical training section.

The vocational section, while developing the pupils' aptitudes for manual and technical work, also includes 2 years of instruction to improve their general educational background. It leads to the *certificat d'aptitude professionnelle* (CAP) (vocational proficiency certificate). The best pupils of this section can go on to a higher vocational school, after a year's preparation, if they wish to.

The theoretical training section offers a choice of two main courses: general secondary and technical secondary. In this section, pupils begin to study the most important scientific theories, historical criticism, philosophical criticism and aesthetic analysis.

The general secondary side comprises two branches: Branch A, known as the literary branch, in which 'arts' subjects predominate and the pupil can continue the study of a modern language, and Branch B, the scientific branch, in which mathematics and the experimental sciences are the main subjects.

The technical secondary side comprises three branches: a 'mechanics' technical branch, in which the physical sciences, and particularly mechanics play an important part; a 'chemistry and biology' technical branch, which concentrates more on chemistry and biology; and an 'economics' technical branch, which devotes more time to the economic and social sciences.

Whenever the syllabus includes the study of languages, English is the compulsory first language, the second language being left to the choice of the pupils.

Types of schools. Secondary education is provided at: junior secondary schools (*écoles secondaires incomplètes*) or short-course colleges for general secondary education, which provide only the first 3-year cycle of secondary education, leading to the BEPC (first-cycle certificate); full general secondary schools (*lycées*), offering both cycles of secondary education leading to the *baccalauréat;* full technical secondary schools (*lycées techniques*) which prepare pupils for the technical *baccalauréat;* vocational schools, which offer only the vocational section of the second cycle of secondary education (3 years); primary teacher training institutes, which offer only the second cycle of general secondary education; evening schools; the National Secondary Correspondence School.

Teaching staff. The teachers for the junior secondary schools or short-course colleges for general education and the teachers for the first cycle of the *lycées*, are recruited among men and women instructors who hold the *baccalauréat*, priority being given to persons with a *licence* (the equivalent of a B.A. or B.Sc.).

Assistant technical teachers of the vocational schools are recruited by competition among technically qualified persons who hold a certificate of industrial education, agricultural education or commercial education or the vocational proficiency certificate, and who have had at least five years' practical experience. They must serve a year's probation before being taken on the regular public teaching staff.

Teachers for the second cycle of the *lycées* and for the primary teacher training institutes are recruited among holders of a *licence* (in education), certificated teachers and *agrégés*.

Secondary school teachers are called upon to teach for 30 hours a week.

Out-of-class activities

Every year, the pupils of each secondary school elect a committee to represent them in dealings with the school management and to contribute to the smooth running of the school. This committee's job is to develop a love of work, initiative and a sense of solidarity among the pupils, and to organize and be the moving spirit in leisure-time clubs likely to render school life more attractive.

TRENDS AND PROBLEMS

The development of education in Guinea is proceeding apace. The main task of the authorities is to translate the people's constitutional right to education into fact by coping with the shortage of school premises, textbooks and supplies and, most important of all, of qualified teachers. Other objects of the reorganization of education in 1959 were to renew African cultural values and give the Guinean population full access to scientific culture and the opportunity to acquire those techniques that the country really needs.

[*Text prepared by the Unesco Secretariat in March 1960.*]

STATISTICS

Population (1 January 1959 estimate): 2,800,000.
Area: 94,926 square miles; 245,857 square kilometres.
Population density: 29 per square mile; 11 per square kilometre.

Summary of school statistics, 1953–57. In 1957/58, enrolment in primary and secondary schools totalled 45,400 pupils, being about 1.7 per cent of the total population. The proportion of girls was 22 per cent in primary education, 11 per cent in general secondary education and 20 per cent in vocational education. Average number of pupils per teacher was 38 in public primary schools, 42 in public secondary schools, and 24 in public vocational courses. Between 1953 and 1957 there was an increase of 80 per cent in primary school enrolment, and 12 per cent in secondary school enrolment, and only in vocational courses was there a slight decrease. (See Table 2.)

Enrolment trends in secondary education, 1950–57. General secondary school enrolment increased five times between 1950 and 1957, though the proportion of girls was reduced by half. In vocational education, the enrolment more than doubled between 1950 and 1955, but dropped back somewhat in 1956 and 1957. The proportion of girls in vocational schools increased from a bare 4 per cent in 1950 to 20 per cent in 1957. Related to the estimated population 15–19 years old, the secondary enrolment ratio nearly doubled between the period 1950–54 and the period 1955–57. (See Table 3.)

Examination results in secondary education, 1953–56. Table 4 shows that the number of certificates granted each year on the completion of the first cycle of secondary studies (*brevet élémentaire* and *brevet des études du premier cycle*) increased two and a half times between 1953 and 1956. The number of vocational proficiency certificates (*certificat d'aptitude professionnelle*) more than doubled during the same period. The number of pupils passing the *baccalauréat*, first part and second part, seems to be increasing but still remains insignificant.

Educational finance, 1958. For the year 1958, budgeted expenditure for education was 2,164 million French francs, representing an average expenditure of 800 francs per inhabitant. (See Table 1.)

HAITI

THE EDUCATIONAL SYSTEM

Article 22 of the Constitution of 1955 lays down the general principles governing education in Haiti. It should be noted that these principles (free choice of education, freedom from expense, compulsory schooling) had already been stated in previous constitutional instruments. Article 22 is worded as follows: 'Freedom of choice in education shall be exercised as the law provides, under the control and supervision of the State, which shall concern itself with the moral and civic training of youth. Public education shall be the responsibility of the State and the communes. Primary education shall be compulsory. Public education shall be free of charge at all levels. Vocational and technical education shall be made available to all. Higher education shall be open on an equal footing to all, on merit only.'

The Minister of National Education, assisted by an Under-Secretary of State, is responsible for urban primary, vocational, secondary and higher education. The Ministry fixes all curricula, supervises the public examinations and awards certificates or diplomas. The Ministry of Agriculture is responsible for rural primary education.

Private schools, many of which are denominational, exist at all levels. They follow government programmes and may receive state aid.

The diagram on page 621 shows the structure of the educational system of Haiti.

TYPES OF SECONDARY EDUCATION

General secondary schools

Secondary education is given in government *lycées* and in private secondary schools. The full course of seven years after the completion of the primary course comprises a lower cycle (the sixth, fifth and fourth classes) in which all pupils take the same subjects, and an upper cycle with division of course into separate branches: Latin-Greek, Latin-science, and science-modern languages. The two parts of the *baccalauréat* are taken in the last two years of the secondary course and this certificate gives access to higher education either in Haiti or in France.

Supervision of studies and of the application of the curricula is exercised mainly by inspectors who visit all schools, both state and private.

The Directorate-General of National Education recently instructed expert commissions to revise the curricula; these commissions prepared draft curricula which are now being tried out in the secondary schools.

Since 1950, the papers for candidates in the *baccalauréat* examinations must first be approved by a special board consisting, for each subject, of four or five teachers specialized in the teaching of that subject.

Teachers for the *lycées* are trained at the Ecole Normale Supérieure (Higher Teacher Training College), which provides a 4-year course. It is hoped that all teaching posts at the *lycées* will gradually come to be occupied by specialized and certificated teachers.

Vocational and technical schools

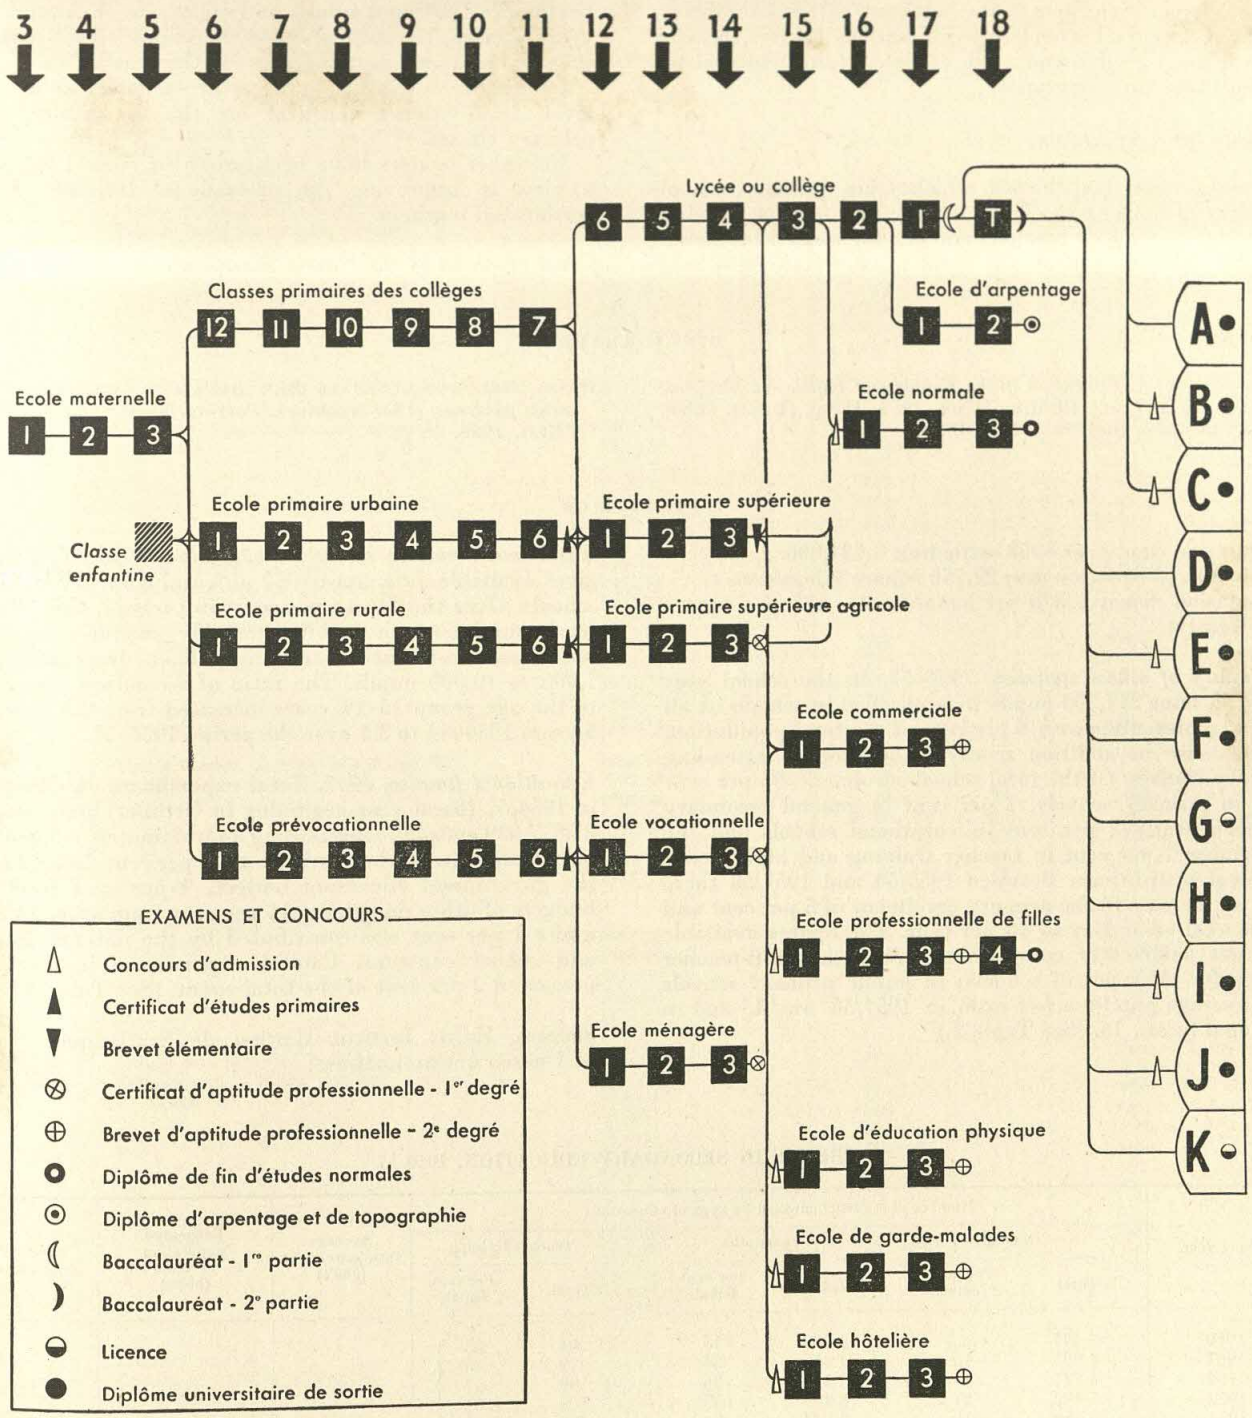
The vocational schools come under the Vocational Section, a sub-division of Urban Education, which is under the control of the Directorate-General of National Education.

Vocational education (3-year courses) is given almost exclusively in the manual and industrial arts, such as cabinet-making, motor mechanics, tin work, mechanics and fitting, blacksmith's work, shoe-making, masonry, ceramics, cutting, weaving, basket-making, domestic arts.

This education is provided in industrial schools (boys), the vocational school of ceramics (mixed), the home economics teacher training school (girls), the schools of domestic arts (girls) and the pre-vocational and vocational boarding-schools (boys). There are also two nursing schools

GLOSSARY

NOTE. For secondary schools (*lycées and collèges*) the numbering of the classes follows the Haitian pattern, beginning at the twelfth class and going up to the first, which is followed by a terminal class shown as T.



classe enfantine: pre-primary class, attendance at which is optional, attached to urban primary school.
classes primaires des collèges: primary classes attached to *collèges* (see below).
collège: private general secondary school with academic course.
école commerciale: vocational secondary school of commerce.
école d'arpentage: vocational training school for surveyors.
école d'éducation physique: vocational training school for physical education instructors.
école de garde-malades: vocational training school of nursing: comes under the Department of Health.
école hôtelière: vocational training school for workers in the hotel and catering industry; comes under the Department of Labour.
école maternelle: pre-primary school.
école ménagère: vocational secondary school of home economics.
école normale: teacher training college.
école prévocationnelle: a pre-vocational school at primary level, with curriculum emphasizing practical subjects and intended as a re-education centre for children of indigent parents.
école primaire rurale: rural primary school, offering a course with a practical bias and including agriculture as a subject.
école primaire supérieure: lower general secondary school.
école primaire supérieure agricole: lower vocational secondary school of agriculture.
école primaire urbaine: urban primary school.
école professionnelle de filles: vocational training school for girls.
école vocationnelle: vocational secondary school preparing for entry into various trades and industries.
lycée: state general secondary school with academic course.

HIGHER EDUCATION

A. *Ecole de comptabilité:* college of accountancy.
B. *Ecole militaire:* military college.
C. *Ecole de pharmacie:* college of pharmacy.
D. *Ecole polytechnique:* polytechnic for the professional training of architects, engineers, etc.
E. *Ecole d'agriculture:* college of agriculture.
F. *Ecole apostolique:* Catholic theological college.
G. *Faculté de droit:* law faculty (legal profession).
H. *Faculté de droit:* law faculty (sociology and administration).
I. *Faculté de médecine:* faculty of medicine.
J. *Faculté d'art dentaire:* faculty of dentistry.
K. *Ecole normale supérieure:* institute of education.

EXAMINATIONS

Baccalauréat—1re partie: university entrance examination, Part I.
Baccalauréat—2e partie: university entrance examination, Part II.
Brevet d'aptitude professionnelle—2e degré: higher certificate of vocational skill.
Brevet élémentaire: The 'elementary certificate', awarded on completion of course at *école primaire supérieure.*
Certificat d'aptitude professionnelle—1er degré: lower certificate of vocational skill.
Certificat d'études primaires: primary school certificate.
Concours d'admission: competitive entrance examination.
Diplôme d'arpentage et de topographie: surveyor's diploma.
Diplôme de fin d'études normales: teacher training diploma.
Diplôme universitaire de sortie: university degree or diploma.
Licence: licentiate.

and a school for workers in the hotel and catering industry.

The commercial schools provide various courses (lasting from 1 to 3 years) and train typists, shorthand-typists, accountants and secretaries.

Teacher training schools

There are five institutions which train primary school teachers of both sexes. These are the two teacher training schools (one for men teachers and one for women teachers), the Elie Dubois School, the rural teacher training school (created in 1954) and an arts and crafts school. After 3 or 4 years' studies, the students of these schools sit for written, practical and oral examinations for the teacher's diploma.

In certain provincial towns, other schools, at a lower level, train women teachers for the pre-primary and primary classes.

Refresher courses have been provided since 1952, with a view to improving the professional training of uncertificated teachers.

STATISTICS

Population (mid-year 1958 estimate); 3,424,000.
Area: 10,714 square miles; 27,750 square kilometres.
Population density: 320 per square mile; 123 per square kilometre.

Summary of school statistics, 1953–57. In the school year 1957/58 some 217,500 pupils were enrolled in schools at all levels, representing over 6 per cent of the total population. There were in addition nearly 17,500 adults attending literacy centres. Of the total school enrolment, 95 per cent was in primary schools, 4 per cent in general secondary schools, nearly 2 per cent in vocational schools and the remaining 1 per cent in teacher training and higher educational institutions. Between 1953/54 and 1957/58 there was an increase in the primary enrolment of 5 per cent and in general secondary of 14 per cent. The figures available are not sufficiently complete to establish pupil-teacher ratios for all types of schools; in public primary schools the average pupil-teacher ratio in 1957/58 was 45 and in national *lycées*, 16. (See Table 2.)

Enrolment trends in secondary education, 1950–57. Table 1 gives available data since 1950 on enrolment in secondary schools. Over the 7-year period 1950 to 1957, the average total enrolment in public general secondary schools, vocational and teacher training schools increased from 7,000 to 10,000 pupils. The ratio of secondary enrolment to the age group 15–19 years increased from 2.2 over the 5 years 1950–54 to 3.1 over the period 1955–57.

Educational finance, 1957. Total expenditure on education in 1956/57 (fiscal year beginning in October) amounted to 21,877,029 gourdes, representing approximately 6.5 gourdes per inhabitant. Of the total spent, 76 per cent derived from the government education budget, 9 per cent from the budgets of other ministries, 14 per cent from special votes, under 1 per cent was contributed by the national lottery and school canteens. Capital expenditure in 1957 represented 2 per cent of the total spent. (See Table 4.)

THE EDUCATIONAL SYSTEM

Chapter III of the Constitution of 19 December 1957 contains the following articles concerning education: 'Education is an essential function of the State, designed to preserve, promote and disseminate culture, the benefits of which must be extended to the entire community without discrimination of any kind' (Article 135).

'The State shall be responsible for the development of the basic education of the people and shall create for that purpose the necessary technical bodies, which shall be under the direct control of the Ministry of Public Education' (Article 136).

'The State shall assist and promote the organization of establishments providing pre-primary, primary and secondary education, including pre-vocational, vocational and art schools. It shall also promote the development of out-of-school education through libraries, cultural centres and other ways of disseminating culture' (Article 137).

'The State shall be responsible for the technical direction of education. Public education shall be secular and provided free of charge and primary education shall, in addition, be compulsory, its cost being covered by the State' (Article 138).

'The training of teachers is primarily the responsibility of the State' (Article 139).

'Teachers shall be entitled to such rights and privileges as are determined by law, and, in particular, to remuneration which, in view of their important mission, will assure them a dignified existence from the social, economic and cultural standpoints' (Article 140).

'The law shall establish a system of promotion for teachers which will ensure stability of employment, regular promotion and efficiency of teaching' (Article 141).

'Private education shall be subject to state regulation and inspection' (Article 142).

'The right to teach shall be subject to proof of capacity as prescribed by law' (Article 143).

'In all schools, both public and private, teaching about the Constitution, civics, national history and geography shall be imparted by teachers who are Hondurans by birth.

'Freedom of teaching is guaranteed' (Article 144).

'Moral instruction, as an independent subject, shall be compulsory in all primary and secondary schools, both public and private' (Article 145).

'The National University is a self-governing institution with legal status. It shall have the exclusive right to organize, direct and develop higher and professional education; it shall contribute to scientific research and to the general dissemination of culture and shall co-operate in the study of national problems. . . . Only the degrees and diplomas conferred or recognized by the Independent National University shall be recognized by the State. . . . Only the holders of recognized degrees and diplomas may exercise professional activities' (Article 146).

'The State shall contribute to the maintenance, development and extension of the Independent National University, as the leading cultural establishment, by granting it an annual subvention equal to 2 per cent of the national budget, excluding loans. The university shall be exempted from the payment of taxes of all kinds' (Article 147).

'The State shall grant scholarships for professional studies, instruction in popular arts and industries and for the advanced training or specialization of graduates who, owing to their aptitudes, capacities or other merits, deserve such assistance. This matter shall be regulated by law' (Article 148).

'The State shall encourage and assist schools for blind, deaf and dumb and mentally backward pupils' (Article 149).

'The State shall assist destitute pupils in accordance with a special law on the subject' (Article 150).

'The professional incorporation of teachers is obligatory; its organization and operation shall be regulated by law' (Article 151).

The powers of the President of the Republic include those of organizing, directing and promoting public education, combating illiteracy and ensuring the dissemination and improvement of agricultural, industrial and technical education in general.

The Minister of Public Education is appointed by the President of the Republic.

Private education is dealt with in Chapter XI of the Education Code comprising Articles 58 to 68, of which the following may be mentioned:

'Every one is free to establish with his own resources educational institutions and to impart in them such education as he deems fit, provided that such education is not contrary to the democratic organization of the State or to public order or morality' (Article 58).

'Private education shall be regarded as a form of co-operation in the discharge of the educational function which is under the direction and responsibility of the State. It shall be governed by the fundamental principles of national education and shall receive financial assistance from the State, except in the cases mentioned in paragraph 2 of Article 6' (Article 59).

'Educational establishments maintained by private persons shall be regarded as private institutions even if they receive subventions from the State; they shall be subject to public inspection to the same extent and in the same way as public schools' (Article 60).

'Studies at private schools shall be officially recognized if they conform to the official study plans and curricula, except in cases in which such schools are of an experimental nature and designed to apply a modern educational method or system previously approved by the competent educational authority' (Article 61).

'Private educational establishments shall be deemed to be authorized or unauthorized according to whether or not

they have been previously and expressly granted this status by the competent educational authority. In the case of private primary schools, authorization shall be granted by the Departmental Directorate of Primary Education, subject to the approval of the Directorate-General of Primary Education. In the case of other private schools, authorization shall be granted by the Executive Authority' (Article 68).

THE DEVELOPMENT OF SECONDARY EDUCATION

With a view to regulating the organization and operation of secondary schools in Honduras, in accordance with the provisions of the Public Education Code, the Ministry of Public Education approved the General Regulations of Secondary Education by Order No. 3098 of 30 June 1953.

Administration

The Directorate and Inspectorate-General of Secondary Education, as a component part of the Ministry of Public Education, is responsible for the organization, direction and control of secondary education. The duties of the Director and Inspector-General of Secondary Education include the supervision of teaching in the secondary schools and sections in the Republic; the preparation and revision of curricula and syllabuses for secondary schools in the light of modern educational thought and the needs of the country, and after due consultation with the teachers; the preparation of methodological guides for teachers; the adoption of suitable textbooks, including the sponsoring of the publication of national works and the translation of foreign works useful for the development of education in Honduras.

Candidates for the post of Director and Inspector-General must: (a) be Hondurans by birth; (b) be state secondary school teachers or primary school teachers with more than 10 years' experience as heads of secondary schools or on secondary school staffs; (c) have maintained a high standard of efficiency in carrying out their duties.

In accordance with Article 16 of the General Regulations of Secondary Education, the staff of the Directorate and Inspectorate-General of Secondary Education is organized in two sections: Technical and Cultural Extension Section, and the Administrative Section.

The Technical and Cultural Extension Section is responsible for all questions relating to legislation, the planning of reforms in secondary education, teaching techniques, curricula and syllabuses, textbooks, achievement testing, examinations for entrance to secondary schools and sections, publications, libraries, refresher courses, lectures, theatre, etc.

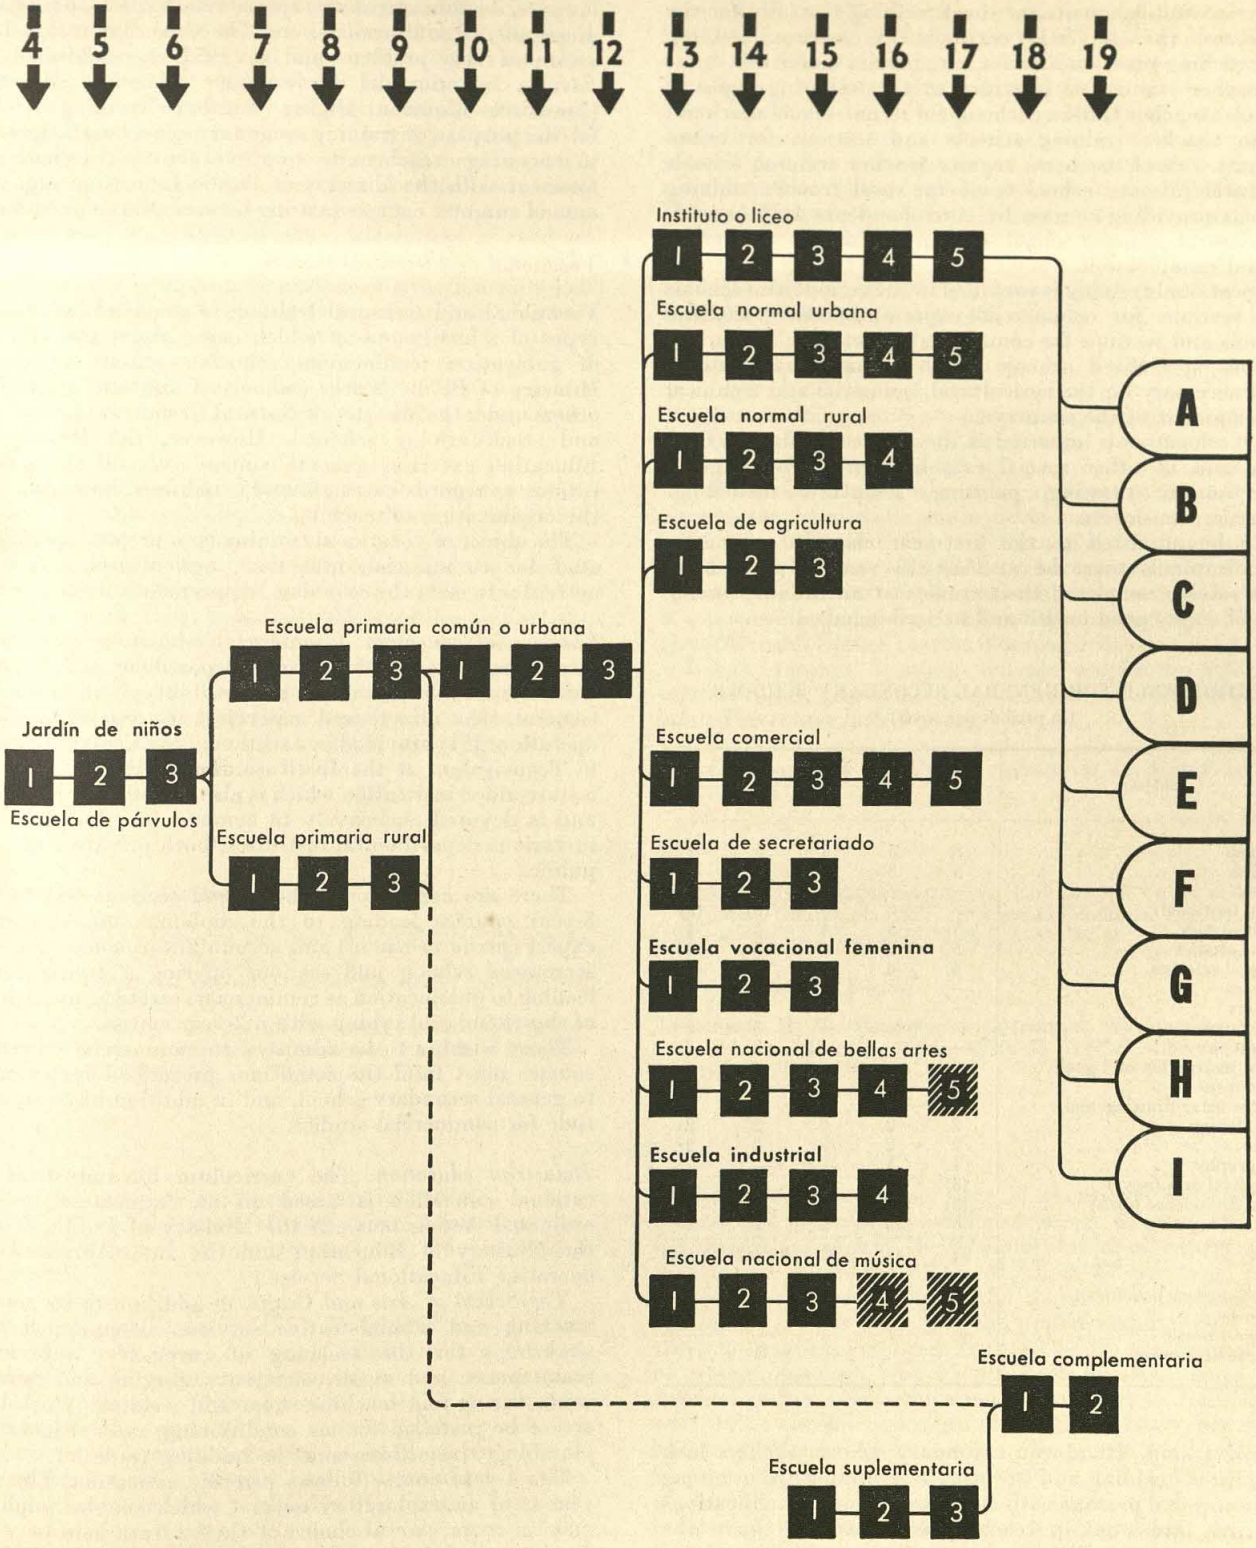
The Administrative Section deals with the administrative and statistical aspects of enrolment, teaching staff, examinations, income and expenditure, budgets, system of promotion, secondary schools and sections, demonstration schools, scholarship holders and boarders, graduates, etc.

Finance. Public secondary education, which is provided at the Central Institute (Instituto Central), is financed by the State; semi-public education, by funds comprising a state subvention, fees paid by the pupils' parents and, in the case of certain establishments, the proceeds from local or departmental taxes and supertaxes instituted by legislative decree. Private education is financed by income from private sources.

TYPES OF SECONDARY EDUCATION

There are four principal types of education at this level: general secondary education; vocational training; teacher training; art education.

General secondary schools



General secondary education is imparted in the secondary schools and sections; these establishments are the Central Institute in Tegucigalpa, the capital, and Departmental Institutes, which operate in certain provincial capitals and in the more important towns; sections may be organized

GLOSSARY

escuela comercial: vocational secondary school of commerce.
escuela complementaria: part-time school for adults at upper primary level.
escuela de agricultura: vocational training school of agriculture.
escuela de párvulos: pre-primary school.
escuela de secretariado: vocational training school of secretarial studies.
escuela industrial: vocational training school of applied arts and trades; one school of this type has an 8-year technical division following the basic course.
escuela nacional de bellas artes: vocational training school of fine arts.
escuela nacional de música: vocational training school of music.
escuela normal rural: teacher training school for teachers in rural primary schools (see *escuela primaria rural*).
escuela normal urbana: teacher training school for teachers in urban primary schools (see *escuela primaria común o urbana*).
escuela primaria común o urbana: complete primary school usually found in urban areas.
escuela primaria rural: incomplete primary school in rural areas.
escuela suplementaria: part-time school for adults at primary level.
escuela vocacional femenina: vocational training school of domestic science.
instituto: general secondary school.
jardín de niños: pre-primary school.
liceo: general secondary school.

at these establishments for those wishing to study for the *bachillerato* (pre-university certificate in science and letters), the teaching profession or for commercial activities.

Teacher training is provided at the following types of schools: teacher training schools for infant-school teachers; urban teacher training schools and sections for urban primary school teachers; regular teacher training schools for rural primary school teachers; rural teacher training schools providing courses by correspondence for uncertificated rural primary school teachers wishing to obtain the official qualification.

Vocational training is provided in the commercial schools and sections for commercial experts; in the secretarial schools and sections for commercial secretaries; and in the various specialized schools which prepare the qualified staff necessary for the agricultural, industrial and technical development of the country.

Art education is imparted at the National School of Fine Arts and at other special establishments providing instruction in drawing, painting, sculpture, modelling, ceramics, music, etc.

To be admitted to the first-year class in secondary schools pupils must be at least 13 years of age, have successfully completed their studies at an urban primary school, enjoy good health and be well-behaved.

Teaching staff. Honduran secondary school teachers lack specialized training and are usually recruited from among graduates and persons with other professional qualifications who are interested in teaching and prove to have the necessary ability. They include primary school teachers, lawyers, doctors, engineers, commercial experts, *bachilleros*, musicians, agriculturalists, etc. The Government has been aware of this problem and in 1957 it established the Escuela Superior del Profesorado 'Francisco Morazán' (Francisco Morazán Higher Teacher Training School) for the purpose of training secondary school staff. In order to encourage teachers to improve constantly their professional skill, the Ministry of Public Education organizes annual summer courses bearing on secondary education.

Vocational and technical schools

Vocational and technical training is provided in different types of school, some of which come under the Ministry of Education (commercial schools), others under the Ministry of Public Works (schools of arts and crafts) and others under the Ministry of Natural Resources (agricultural and stock-farming schools). However, the Ministry of Education exercises general control over all these institutions as regards curricula and syllabuses, inspection and the organization of teaching.

The object of vocational training is to prepare specialized staff for commercial, industrial, agricultural and other activities to meet the economic requirements of the country.

Commercial education. Commercial education is administered through a division of the Department of Secondary Education, under the direct responsibility of an Inspector-General, who directs and supervises its organization and operation. It is provided in a section of the Central Institute in Tegucigalpa, at the Instituto Hector Pineda Ugarte—a state-aided institution which is also situated in the capital and is devoted exclusively to commercial education, and in various departmental institutes, both private and semi-public.

There are commercial schools and sections which offer 5-year courses leading to the diplomas of commercial expert (*perito mercantil*) and accountant (*contador público*); secretarial schools and sections offering a 3-year course leading to qualification as commercial secretary, and schools of shorthand and typing with a 2-year course.

Those wishing to be admitted to commercial education courses must fulfil the conditions prescribed for entrance to general secondary school, and in addition have an aptitude for commercial studies.

Industrial education. The curriculum for industrial vocational education is based on an Agreement for Co-ordinated Action between the Ministry of Public Works, the Ministry of Education and the Inter-American Co-operative Educational Service.

The School of Arts and Crafts, in addition to its general teaching and administrative services, is equipped with workshops for the teaching of carpentry, automobile maintenance and repair, electricity, forging and foundry work, fitting and machine shop, and welding. Workshops are to be installed for air conditioning and refrigeration, plumbing, tinsmithing and the building trades.

The 4-year course follows primary education. The first year is of an exploratory nature, which enables pupils to make a more careful choice of their future field of work. At the end of the 4-year course, students obtain a diploma

certifying that they have completed their studies. Seventy-five per cent of the graduates of this school will be engaged under contract as industrial apprentices. The remaining 25 per cent will be recommended for admission to the technical division, where they will receive advanced training equivalent to the first 2 years of university education. In this division they will follow courses which will qualify them for employment as workshop foremen, workshop proprietors, industrial art instructors, etc.

The School of Industrial Arts, which was opened on 2 July 1956, replaces the Textile Technical School. The school is being equipped to provide instruction in woodwork, upholstering and reconditioning of furniture, leatherwork, pewter work, repair of jewellery, clock and watch repair, and repair of cameras, as well as the making of textiles by hand. The course, which follows primary education, lasts 4 years, the first year being of an exploratory nature.

Girls' vocational training school. Domestic science teaching comes under the jurisdiction of the Ministry of Public Education; the Directorate-General of Secondary Education is responsible for its administration and supervision. Its main object is to prepare girls for their duties as housewives and teach them how to apply scientific and artistic knowledge to domestic activities. The course, which follows primary education, lasts 3 years. Pupils who pass the final examination obtain a diploma (*capacitación para la vida del hogar*) which qualifies them as domestic science teachers in the fundamental education campaigns and in the rural welfare programmes.

Agriculture and stock-farming schools. A model farm school has been operating since 1952 and is situated at Catacamas, some 62 miles from the capital. The course of studies (agriculture, horticulture, stock-farming, etc.) lasts 3 years and follows primary education. Pupils who successfully complete the course obtain a diploma which entitles them to employment as farm managers or in the agricultural and stock-raising services of the Ministry of Natural Resources, of the Ministry of Education, etc.

The Pan-American Agricultural School, a private institution situated at El Zamorano, admits pupils who hold the *bachillerato* or have successfully passed certain secondary educational courses.

Teacher training schools

Teacher training comes under the jurisdiction of the Department of Secondary Education.

Rural teacher training schools provide a 4-year course, which follows primary education; the curriculum includes agriculture, handicrafts and rural industries.

In July 1953 the School for Rural Teacher Training by Correspondence was established in recognition of the need to raise teaching standards in the country districts; in 1956 it was considerably reorganized and became part of the Francisco Morazán Higher Teacher Training School in the capital.

Urban teacher training schools emphasize activity methods and 'globalization' (centres of interest, projects, etc.). The course lasts 5 years.

STATISTICS

Population (mid-year 1958 estimate): 1,828,000.
Area: 43,277 square miles; 112,088 square kilometres.
Population density: 42 per square mile; 16 per square kilometre.

Summary of school statistics, 1953–57. In 1957 enrolment at all levels of education, excluding adult literacy centres, was over 162,000 pupils, representing some 9 per cent of the total population. Of these pupils, under 2 per cent were in kindergartens, over 90 per cent in primary schools, 1.5 per cent in general secondary schools, 4 per cent in commercial courses, 1.8 per cent in secondary teacher training schools and the remainder, less than 1 per cent, at the national university. Girls made up 48 per cent of the enrolment in primary schools, 17 per cent in general secondary schools, 47 per cent in vocational commercial schools, 68 per cent in teacher training courses, and 12 per cent at university. The teaching staff at all educational institutions numbered 6,145, of whom 67 per cent were women. In primary schools the number of teachers increased by 12 per cent over the period under review but the pupil-teacher ratio rose from 28 to 32; the proportion of women teachers was 77 per cent in 1957. Data for teachers in secondary education are incomplete. Compared with 1953, enrolment increased at all levels of education and in particular by 27 per cent in primary schools, by 96 per cent in general secondary schools and by 46 per cent at teacher training courses. The number of students enrolled at the National University more than doubled between 1953 and 1957. (See Table 1.)

Enrolment trends in secondary education, 1946–57. Average total enrolment in all secondary schools increased steadily from 5,700 pupils in the 5 years 1950–54 to 10,900 pupils in the 2 years 1956–57, the ratio of secondary enrolment to the estimated population 15–19 years old rising from 3.6 to 6.2. Between 1946 and 1957 the proportion of girls attending general secondary schools increased from 10 to 17 per cent. (See Table 2.)

Examination results in secondary education, 1956–57. Over the 2 years for which examination results are available, the number of general secondary school diplomas granted rose from 229 to 273, the proportion of successful girl candidates being 18 per cent of the total in 1957. Commercial diplomas were awarded to 795 students of whom 58 per cent were women in 1957, representing an increase of 29 per cent on the number in the preceding year. Teaching diplomas increased from 352 in 1956 to 388 in 1957 of which 77 per cent were awarded to women candidates.

Educational finance, 1958. According to data published by the Unesco Regional Office for the Western Hemisphere in the *Boletin Trimestrial de Proyecto Principal de Educación Unesco—America Latina*, Vol. 2, No. 5 (January-March 1960), the 1958 budget estimate of the Ministry of Education amounted to 13,526,000 lempiras, of which 7,898,000 lempiras were allotted to primary education. Official exchange rate: 1 lempira = 0.50 U.S. dollar.

1. Commercial schools only.

2. General and vocational education only.

HUNGARY

THE EDUCATIONAL SYSTEM

After the second world war and the liberation of Hungary in 1945, a fundamental change was introduced into the Hungarian educational system. The Law of 1940 had already established the principle of compulsory primary education in the first 8 grades, but this law was never applied, even in the large towns. It is only since 1945 that children from 6 to 14 have actually been obliged to attend the 8-year general school (which follows on from the non-compulsory nursery school). For some years after 1945, however, the churches, local authorities and even private persons were entitled to maintain schools, with a consequent lack of uniformity in the teaching. The Law of 1948, on the nationalization of schools, provided for the establishment of general schools and the development of specialized education, and made possible a great increase in the number of pupils. Today, there are 6,314 general schools, and the total number of pupils exceeds by 200,000 the number of pupils between the ages of 6 and 14 in 1938.

All general schools are 8-grade schools, and it is only in the smallest centres of population that grades 5–8 are still grouped together for teaching purposes. In grades 1–4 (pupils between 6 and 10 years of age), all instruction is given by the same teacher, but in the towns these classes often have specialized teachers for certain subjects (singing, physical culture, drawing, etc.). The specialized teaching in grades 5–8 is entrusted to teachers who have been trained at the university or some other higher educational establishment. In the towns and provincial administrative centres, there are even specialized general schools where teaching is given in Russian, and general schools for the teaching of music and singing.

In 1954, on the basis of a decision taken by the Hungarian Workers' Party (MDP), a new curriculum was developed for the schools, and this is now in force. During the school-year 1958/59, practical technical activities were introduced into 500 schools of this type, with a view to initiating the development of polytechnic training.

General schools can be organized and maintained only by the State, and the teaching given in them must conform to the state curricula and textbooks. The local councils (village, town, canton and county) are responsible for the direction, supervision and upkeep of the general schools. The Ministry of Education is the state authority responsible for the direction and supervision of public education. On completing their studies at the general school, a considerable number of pupils (approximately 30 per cent) enter full-time employment. The others—i.e., the majority—continue their studies at the establishments which train specialized workers, or at secondary schools (general high schools and technical schools). Twenty-five per cent of the pupils who complete the courses at these secondary schools continue their studies at a higher educational

establishment, particularly at the university. The diagram on page 633 shows the structure of the educational system in Hungary.

THE DEVELOPMENT OF SECONDARY EDUCATION

The first law concerning secondary schools dates from 1883. This provided for two types of schools for a very carefully selected number of pupils between 10 and 18 years of age: the *gimnázium*, where teaching was based on the classical languages (Latin and Greek), and the modern school, where teaching was based on the sciences.

Both these types of school provided an 8-year course.

This system of secondary education remained in force until the first world war. A radical change was introduced into its structure and curricula by the Law of 1924, which established a modified classical *gimnázium* (where, however, fundamental importance was still attached to Latin), a modern *gimnázium*, where priority was given to the teaching of modern languages, and a modern school, where more importance was attached to mathematics and the natural sciences. The Law of 1926 provided for girls' secondary education by organizing in addition to schools corresponding to the boys' *gimnázium* and modern *gimnázium*, the girls' college (which did not prepare pupils for higher studies).

A new reform was introduced by the Law of 1934, which established a single type of secondary school, namely the *gimnázium*. The latter was an 8-grade school and provided education for a selected number of pupils between 10 and 18 years of age. Grades 1–4 shared the same syllabus; in grades 5–8, pupils were offered a choice, according to whether the emphasis was placed on Latin, modern languages or science.

This secondary school continued to operate until the Liberation, when the Government established the 8-year general school and the 4-year secondary school. Until these measures were applied, children of 10 years of age who were not admitted to the different types of *gimnázium*, could only, until the age of 14, follow the upper primary school course (4 years), or learn a trade by attending courses, where the teaching was much inferior, at the apprenticeship schools (vocational training schools). Pupils who had completed the 4 upper years at a primary school, or the first 4-year course at a secondary school, were able to continue their studies at a vocational secondary school (either a 4-year commercial school, or a 3- or 4-year higher industrial school, or a 2-, 3- or 4-year agricultural school). Before the Liberation, the level of the industrial schools was very low. The 1884 Law on Industry had made it obligatory for the towns to organize schools for industrial apprentices; in addition, the more important factories ran a certain number of specialized workers' school, where three half-days per week were devoted to general and technical education. The 1924 decree had slightly modernized the curriculum of these schools, and this curriculum—particularly with regard to vocational subjects—was to remain in force until 1949.

The structure and curriculum of the *gimnázium* were fixed by Decree No. 14 of 1951, which assigned to this institution the task of developing the knowledge acquired by pupils at the general school and of preparing them for higher education. The *gimnázium* comprised two sections, the science section and the humanities section (languages and history).

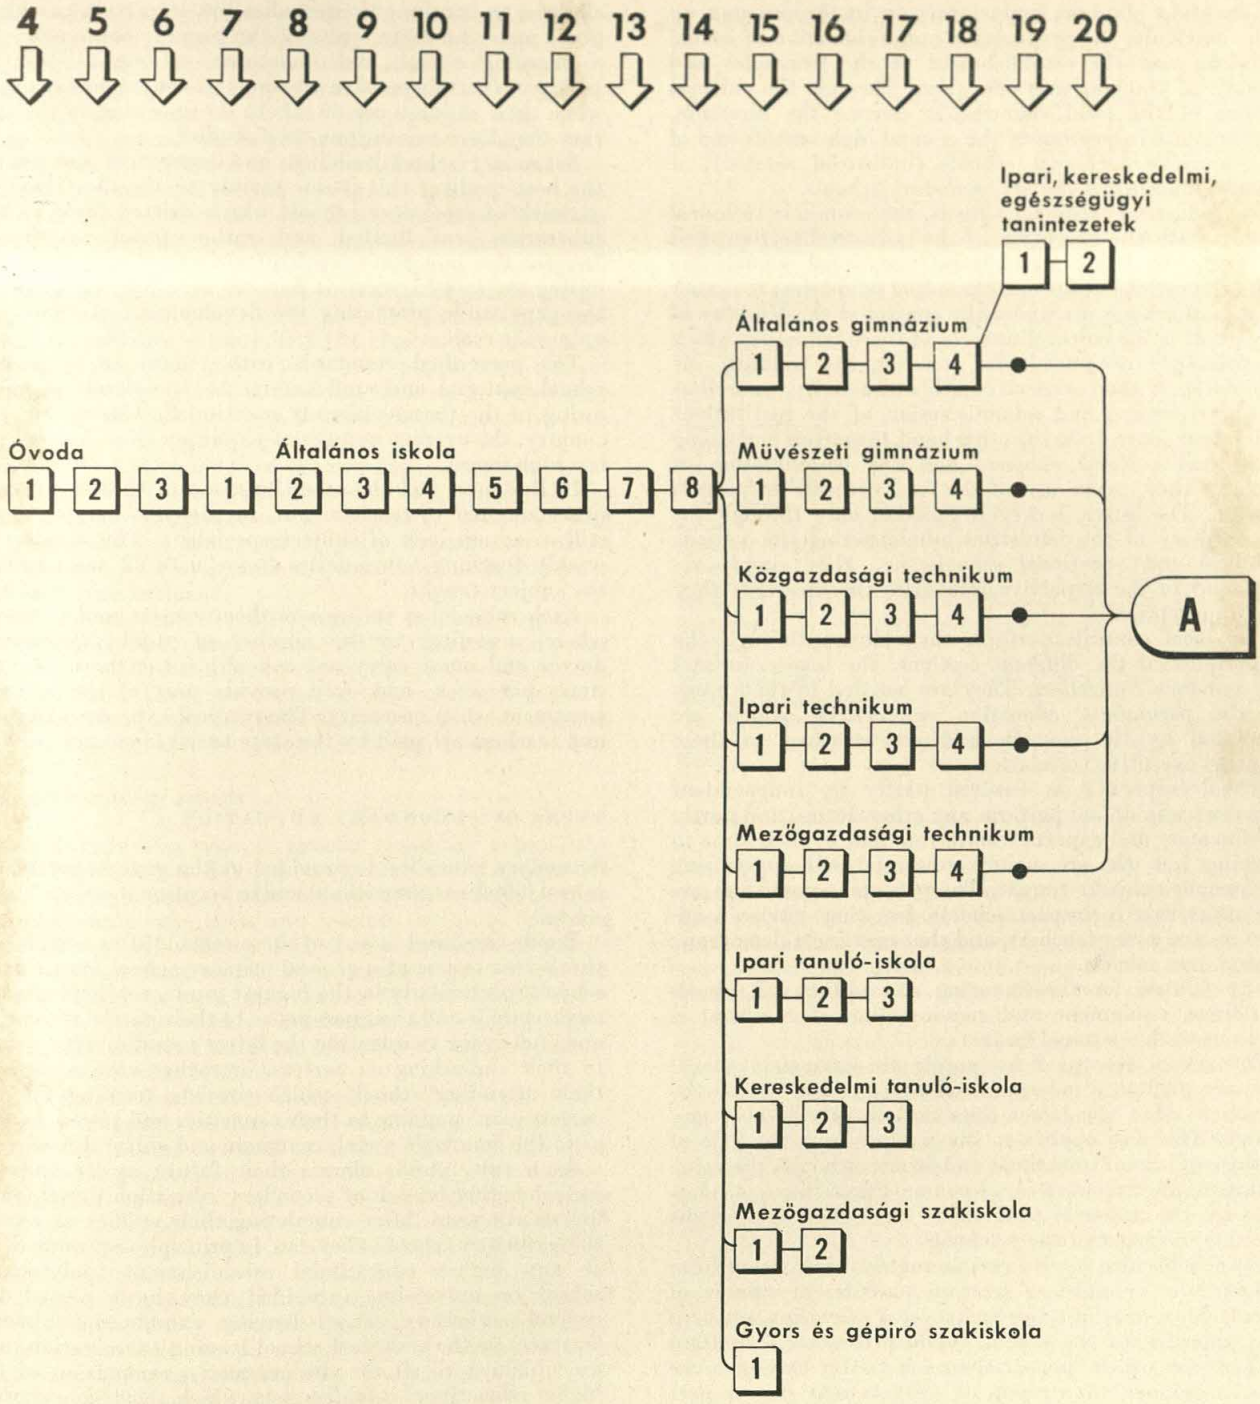
Technical secondary schools were instituted in 1947 by a decree of the Ministry for Industry. In 1949, technical secondary schools, designated as technical or industrial *lycées*, were created in which there was no differentiation of studies until the third or fourth year. In order to meet the needs of socialist industry, the present industrial technical schools were organized in 1950; they are placed under the control of the various ministries for industrial questions, and their structure was fixed by Decree No. 37 of 1955. The agricultural technical schools developed on the same lines as the industrial technical schools and come under the same legislation.

The commercial secondary schools which existed before the Liberation have become economic technical schools, comprising various sections.

The law relating to industrial apprentices (1949) fixed the present system for the training of specialized workers.

All secondary educational establishments are maintained by the State. In accordance with the agreements concluded with the various churches, there are still 11 denominational secondary schools (*gimnázium*)—8 Catholic, 1 Protestant and 2 Jewish—with 84 classes and a total of 2,073 pupils.

Administration



The direction, control, supervision and financing of secondary education are the responsibility of the public authorities, principally the Ministry of Education. In addition to issuing educational directives to other ministries controlling schools at secondary level, the Ministry

GLOSSARY

általános gimnázium: general secondary school.
általános iskola: primary school.
gyors-és gépiró szakiskola: vocational training school for steno-typists.

of Education plays an important part in the drawing up of the curricula, the preparation and publication of school textbooks and the establishment of the principles and methods of teaching and education. Through the cultural sections of the local councils, it ensures the direction, financing and inspection of the general high schools and of the economic technical schools (industrial section); it directly administers the art secondary schools.

The industrial technical schools, the economic technical schools (with the exception of the industrial section) and the commercial and agricultural vocational schools are under the control of the corresponding ministries; the other vocational schools are under the control of the Ministry of Labour. It is the cultural sections of these ministries which are primarily responsible for ensuring the training corresponding to their respective fields of activity, as well as for the financing and administration of the institutions under their control. On the other hand, in matters pertaining to general cultural subjects and the co-ordination of teaching they make use of the local councils' inspection services. The latter, however, function only through the intermediary of the ministries administering the various technical and vocational schools, i.e., they simply recommend to the respective ministries the measures they deem appropriate.

The local councils perform their duties through the rapporteurs of the different sections, the inspectors and the economic controllers. They are assisted in their work by the permanent education committees, which are appointed by the councils and are attached to these councils' executive committees.

School inspection is ensured partly by independent educators who do not perform any other duties, and partly by educators and experts who devote half of their time to teaching, but who are mainly concerned with supervising the various subjects taught. The parents' committees are not authorized to inspect schools, but they advise headmasters and assist teachers, and thus exercise a democratic control over schools.

Expenditure for the financing and upkeep of schools (buildings, equipment and remuneration of teachers) is paid out of the national budget.

The school fees paid by pupils are extremely small; they are paid to a governmental account and not to the school, so that the latter does not directly receive any money. This also applies to the receipts from the sale of produce of school workshops and farms, although the value of this productive work is, of course, taken into consideration by the financial authorities when they open credit accounts in favour of these schools.

The schools also receive certain material aid, either from the parents' committees (certain parents, or groups of parents may purchase, for instance, a television set or a film projector for the school, found prizes, etc.), or from the factories which sponsor them (the latter may give the school machines, or a group of workers may devote part of its time to constructing school buildings, fitting them up or preparing equipment for the pupils' practical work, etc.).

Only a few years ago, it was still necessary to award scholarships and grants in order to facilitate studies at secondary schools, but this necessity hardly ever arises now. Most parents have sufficient means to enable their children to continue their studies but in certain cases the State pays the entire costs of the pupil's maintenance in a boarding school, and sometimes—through the intermediary of certain social institutions—even supports parents when their children are unable to do so, owing to the fact that they have to continue their studies.

Secondary school buildings and equipment are not of the best quality; this is due mainly to the fact that the network of secondary schools which existed prior to the Liberation was limited and rather poorly equipped. Despite the important work of construction undertaken during the last 15 years, it has not been possible to fill in the gaps while promoting the development of education on a vast scale.

The prescribed standards with regard to secondary school material and staff cannot be completely applied, owing to the reasons already mentioned. Throughout the country, the average number of pupils per class is 40, which is a high figure.

In Budapest and the other large towns there is an adequate number of teachers but, in the provinces, there is still a certain lack of subject specialists. The number of weekly teaching hours varies from 20 to 22 according to the subject taught.

Each school has its own medical service and premises where, according to the number of pupils, the school doctor and nurse carry out a health inspection 2, 4 or 6 times per week, and even provide part of the medical treatment when necessary. The medical expenses of pupils and teachers are paid by the state social insurance service.

TYPES OF SECONDARY EDUCATION

Secondary education is provided at the general secondary school (*általános gimnázium*) and in vocational and technical schools.

Pupils can enrol at any of these schools after completing the 8-year course at a general primary school. At primary schools, particularly in the highest grade, teachers already advise pupils and their parents as to their pupils' prospects, and endeavour to orientate the latter's studies with a view to their embarking on careers, or rather with a view to their attending schools which provide training for the careers corresponding to their capacities and tastes, as well as to the country's social, economic and cultural needs.

As a rule, pupils choose their future career and the corresponding branch of secondary education during their fourteenth year. After completing their studies at any of the secondary schools, they can, in principle, continue them at any higher educational establishment (polytechnic school or university), provided they have passed the general secondary school leaving examination (baccalaureate) or the technical school leaving examination, and are qualified to sit for the entrance examination of the higher educational establishment which they have chosen.

The vocational schools do not prepare pupils for higher education, but pupils who complete their studies there can continue their secondary education by following the evening or correspondence courses organized by the *lycées* or technical schools, and sit for the baccalaureate examination or the technical school-leaving examination.

All young people who are at least 15 years of age and who are engaged in productive work are entitled to attend the evening courses or correspondence courses for workers. The 129 secondary evening schools, with their 509 classes, provide instruction for 12,251 young people who, after their work, attend courses four times a week and study all the subjects included in the curriculum of the ordinary schools (except the second foreign language, for these courses include only one compulsory language, Russian). The correspondence courses are limited as regards certain of the less important subjects (psychology, descriptive geometry, singing) and do not include a foreign language. For the school-year 1958/59, the 279 secondary correspondence schools comprised 1,122 classes with a total of 28,330 pupils. One day each week pupils can consult teachers; at the end of each term, there is a compulsory test in all the subjects studied and, at the end of each school year, a complete examination.

Pupils who have followed the evening or correspondence courses of a secondary school and who have passed the baccalaureate examination, or technical school-leaving examination, can attend the regular courses, as well as the evening or correspondence courses of a higher educational establishment.

The school year, for all secondary schools, begins on 1 September and usually ends on 20 June; it comprises 33 school weeks. Pupils enrol on the first working day after 20 June. There are 6 working days per week, usually from 8 a.m. to 1 p.m. or 2 p.m. Each lesson lasts 50 minutes in the morning, and 40 minutes in the afternoon.

General secondary schools

There is only one type of general secondary school, the *általános gimnázium*. It comprises two sections: humanities (emphasizing languages and history) and a modern section (science). As a rule, these two sections are to be found in all grades of all schools. The course provides all pupils with a comprehensive picture of modern general culture corresponding to their age (14 to 18 years). The table below shows the weekly distribution of teaching hours among the different subjects included in the curriculum for the school-year 1958/59.

The humanities section is sometimes designated as the Russian language section when there is a considerable number of lessons devoted to that subject as well as a corresponding reduction in the number of the other lessons.

In order to help pupils to develop their faculties, aptitudes and tastes, there exist in each *gimnázium* from 8 to 10 study circles which, under the direction of the best specialized teachers, devote themselves to the study of the various subjects taught. Thanks to lectures, practical work, the joint study of various problems, discussions, etc., these study circles prepare pupils for specialized higher studies, or for vocational training. During the school-year 1958/59, 76,396 pupils took part in the activities of 3,207 study circles. Pupils also have the possibility of learning a third language, music, or industrial or artistic drawing.

The pupils' work, oral and written, is marked as follows: 5 (very good), 4 (good), 3 (fair), 2 (pass or satisfactory), 1 (unsatisfactory, bad or very bad). A pupil who, at the end of the year, receives a mark equivalent to 'unsatisfactory' for one or two subjects, can sit for a further examination at the beginning of the following year and, if he passes, can continue his studies in a higher grade. A pupil who fails in three or more subjects must spend another year in the same grade before being able to continue his studies. At the end of each school year, there is no examination proper, but a general revision of the subjects taught. At the end of the fourth year, candidates sit for the baccalaureate examination at the school they have attended; the board of examiners consists of their teachers for that year and of a chairman appointed by the Ministry. This examination comprises a written test (Hungarian, Russian and mathematics) and an oral test (Hungarian, history, mathematics and physics). In addition to these compulsory subjects, the candidate may sit, if he wishes, for a written test bearing on a second language.

Gimnázium teachers are trained at the different university faculties. They are partly recruited on a competitive basis, and are appointed by the head of the local council's cultural section. Their promotion is automatic, every second, third or fifth year. The best of them—their number corresponds to a limited proportion of the total number of teachers—can be promoted by the establishment employing them. Teachers usually hold a diploma authorizing them to teach two subjects, but several of them hold a diploma qualifying them to teach a third subject related to the other two (in the latter case, they must have completed additional studies at the university).

The curriculum of the art *gimnázium* is similar to that of the general secondary school, but modified so as to include the theoretical and practical teaching of some branch of art. This type of *gimnázium* (at present there are eight of them) constitutes a transition between the general secondary school and the vocational secondary school.

Vocational and technical schools

The other main category of secondary schools in Hungary comprises the vocational and technical schools. Until recently, this category also included the teacher training schools and the pre-primary teacher training schools, which trained, respectively, teachers of grades 1 to 4 in the primary and general schools, and nursery school teachers. At the end of the school-year 1958/59, however, these schools were replaced by new institutions—one providing a 2-year course for nursery school teachers, and the other a 3-year course for teachers of grades 1 to 4 in the general schools—open to holders of the baccalaureate. These two institutions, thus transformed into higher educational establishments, do not come within the scope of the present survey.

Technical schools. While providing pupils with a general education, these schools also give them some practical experience in industry or agriculture and teach them the basic principles of economic administration in both these fields. The vocational training is partly theoretical and partly practical. The practical training is given, during the school year, in the school workshops, laboratories or offices and, during the summer holidays, in the factories; this practical training totals 4 weeks per year.

The task of the technical schools is to train technicians in production or economic administration. The curriculum of these schools is extremely varied. The weekly time-table comprises 36 lessons—including practical work—of which 40 per cent are devoted to general culture. The number of lessons devoted to practical work varies, according to the class and speciality concerned, from 6 to 12 hours per week.

Owing to the large number of candidates, and in order to make as fair a selection as possible, pupils are admitted to the industrial technical schools only after they have passed an entrance examination. For the other sections of the technical schools, the conditions of admission are virtually the same as for the *gimnázium*.

At the end of the school year, there is no examination; the system of marking and the method of promotion from one class to another are the same as in the *gimnázium*. At the end of the fourth year, pupils must pass an examination in order to receive a technician's diploma. This examination comprises oral and written tests in the following subjects: the Hungarian language, history, mathematics and, according to the speciality chosen, physics, chemistry or biology, and two or three other (vocational) subjects, as well as practical work. Pupils who obtain the technician's diploma work in a factory for another year or two in order to acquire more advanced practical experience as specialized workers; they are then appointed to technicians' posts.

Specialists who have completed their studies at an economics technical school are appointed to a body responsible for economic administration in the field of production, or to a financial or economic post in the field of national administration. The best pupils from the technical schools generally continue their studies at a higher educational establishment providing training in the same speciality as the school they have just attended; but they can enrol at any university, provided they pass the entrance examination.

Technical school teachers must have a university degree or a specialist's diploma (in engineering, economics, etc.). Practical instruction is entrusted to technicians or to excellent specialized workers. The remuneration and promotion of technical school teachers are governed by the same rules as those of *gimnázium* teachers.

Vocational schools. The training of specialized workers is, to a large extent, carried on simultaneously in schools established for that purpose and in factories or distributing centres.

The network of establishments where specialized workers are trained in the various branches of production and distribution is extremely complex (22 branches with a total of 300 specialities). The actual teaching is provided mainly at the establishments and workshops under the control of the Ministry of Labour. During the school-year 1958/59, 39,218 of the 101,561 pupils of the vocational schools were working in the institutions controlled by the Ministry of Labour; 44,352 were being trained at workshops belonging to local industrial co-operatives or small industries and subject to the control of the local councils and to the supervision of the Ministry of Labour; and 17,991 were trained at establishments belonging to various factories and educational organizations under the control of the different ministries responsible for production and distribution. Pupils are employed by factories as apprentices on the conditions fixed by law. In certain branches, they are admitted only after they have passed an entrance examination requiring general knowledge and special aptitudes. Prior to their admission, they must have passed the leaving examination of the 8-year general school, and have obtained a medical certificate issued by an approved doctor. The length of the training period depends on the speciality chosen, but it is usually 1, 2 or 3 years—in most cases, 3 years.

In addition to theoretical and practical vocational training, the curricula always include general educational subjects, whose importance varies according to the speciality chosen; with regard to vocational training proper, the curricula allow four times more teaching hours to practical than to theoretical instruction, for in their third year pupils are trained at the factory itself.

During their studies, pupils also do productive work and therefore receive a fixed salary. Those whose work is not satisfactory are excluded from the courses, and their appointment is terminated. On the completion of their vocational training, pupils must sit for an examination comprising theoretical and practical tests, the board of examiners being appointed by the State. Those who are successful receive a specialized worker's diploma.

As already indicated, the vocational schools do not prepare pupils for studies at a higher level, and the diplomas they confer do not give access to higher education. Once he has passed the examination, the pupil is usually em-

ployed at the factory where he has been trained, but he is free to look for employment elsewhere.

The teaching staff of vocational schools is composed of teachers, engineers, certificated technicians and the best specialized workers. The remuneration of this staff is essentially the same as that of technical school teachers.

Among the various establishments depending on the vocational schools, the pupils' centres and the school workshops are of special educational importance. They provide workers with excellent specialized training and inculcate in them valuable human qualities. The pupils participate in the community life of the factory workers and in the activities of their political and cultural organizations. Thus, the training of specialized workers is ensured by several institutions: pupils' centres, schools, school workshops and factories.

The schools that specialize in shorthand and typing are attended by girls who have completed their studies at the 8-year general school. The courses usually last 6 months or a year (2 years at the higher level); in addition to vocational teaching, they comprise general educational subjects including the Hungarian language. On the completion of their studies, pupils can sit for an optional examination, which is simply designed to test certain aptitudes and does not give access to higher education.

Out-of-class activities

The work of the study circles, already mentioned, complements the teaching of the subjects included in the curriculum of various educational establishments. The pupils' centres and school study circles also play an important part in secondary education. The former provide board and lodging for pupils whose parents live in places where there is no secondary school of the type which the pupil wishes to attend. These centres initiate pupils in community life; they are attached to certain schools, and are sometimes placed under joint direction, unless they are attended by pupils of several schools of the same kind.

The school study circles are placed under the supervision of a teacher; they are installed in the schools themselves, and the pupils who make use of them are those who are unable to study at home or who particularly need supervision and advice.

During out-of-class hours, it is the school sports clubs and literary, music and art clubs which organize the pupils' social and cultural activities. Pupils, under the supervision of a teacher, enjoy a considerable degree of independence. The organization in charge of the political and socialist education of youth is the Communist Youth Union; its members include the best pupils, those who have reached the highest level of development from the moral and political standpoints. This organization plays a leading role in the life of all the pupils.

The dancing lessons organized at the schools, the dance evenings and sports festivals, the group excursions, the holiday camps, and collective visits to theatres and concerts also contribute to the realization of the aims of education, by an appropriate use of leisure hours. All these activities are supervised by teachers, or take place in their presence so that they can always intervene if necessary. In this way, these activities extend the school's educational influence by contributing to the socialist education of young people between 14 and 18 years of age.

TRENDS AND PROBLEMS

The main secondary educational problems in Hungary concern: the content of present-day general secondary education; the relation between the sciences which are still developing and the curricula which can and must be applied in schools; the needs created by the development of production and the necessity of providing practical training; the overworking of pupils; the extension of compulsory attendance to secondary schools, rendered necessary by the evolution of modern life; educational problems relating to the building up of socialism.

It is with a view to resolving these problems that it is planned to undertake, in the near future, a further reform of education.

[*Text prepared by the Hungarian National Commission for Unesco in July 1959.*]

STATISTICS

Population (mid-year 1958 estimate): 9,857,000.
Area: 35,919 square miles; 93,030 square kilometres.
Population density: 274 per square mile; 106 per square kilometre.

Summary of school statistics, 1953–57. During the school year 1957/58, there were over 1.5 million pupils enrolled at educational institutions, of whom about 43 per cent were girls. In addition, there were 36,479 persons attending adult education classes.

Total enrolment, which represented approximately 16 per cent of the total population, was distributed as follows: pre-primary education, 10 per cent; primary education, 78 per cent; secondary education, 10 per cent; higher education and special education, 2 per cent.

Total enrolment in 1957/58 was 4 per cent higher than in 1953/54. Between 1953 and 1957, the enrolment increase was 5 per cent in primary schools and 41 per cent in gymnasiums. Owing to certain decisions on educational policy, however, the number of pupils enrolled in other institutions, and in particular in teacher training colleges, declined over the period under review.

In nursery schools and in general schools of primary education, girls made up approximately half the total

enrolment. At the secondary level, the percentage of girls enrolled increased in gymnasiums (from 48 per cent in 1953/54 to 56 per cent in 1957/58) and decreased in vocational schools (37 per cent in 1953/54 against 30 per cent in 1957/58). The proportion of women on the teaching staff changed very little between 1953 and 1957; it was approximately 60 per cent in primary schools and 40 per cent in gymnasiums.

In spite of the reduction in enrolment in teacher training colleges, the teaching staff continued to increase, particularly in primary schools, where the pupil-teacher ratio fell from 28 in 1953/54 to 23 in 1957/58. (See Table 2.)

Enrolment trends in secondary education, 1930–37 and 1946–57. During the above two periods, enrolment in general secondary education increased at a high rate until 1953/54. This is true also for vocational education. Enrolment in teacher training colleges fluctuated. Average total secondary enrolment was 44,000 in 1930–34 and 162,000 in 1955–57. The ratio obtained by relating these averages to the estimated population 15–19 years old rose from 5 (1930–34) to 22 (1955–57). (See Table 4.)

Examination results in secondary education, 1953–57. Between 1953 and 1957, the increase in the number of certificates awarded was 63 per cent in general education and 18 per cent in vocational education. In 1957/58, there were only 1,135 teaching certificates granted against 3,104 in 1953. This corresponds to the decrease in enrolment in teacher training colleges. (See Table 3.)

Educational finance, 1957. For the year 1957, total recurring expenditure on education amounted to 2,475 million forints, which represents an average of 252 forints per inhabitant. (See Table 1.)

Source. Hungary: Ministry of Public Education and Culture, reply to Unesco questionnaire.

1. EDUCATIONAL FINANCE, 1957 (in thousand forints)[1]

Recurring expenditure by level and type of education	Amount[2]		Per cent

1. Data refer to the 4-grade *gimnázium* and to secondary courses for adults.

ICELAND

THE EDUCATIONAL SYSTEM

All schools operated or subsidized by public funds are integrated into one school system, and studies in all public schools are organized in such a way that pupils moving from one district to another are not handicapped when changing schools. Standards of examination are unified, and individual schools may without further entrance examination receive pupils from any part of the country.

Primary and lower secondary schools for children between the ages of 7 and 16 are almost solely financed by public funds, i.e., by local authorities and the State jointly. Grammar schools, i.e., upper general secondary schools (*menntaskólar*) and the university are entirely maintained by the State. These schools may be attended by all, irrespective of religious denomination. Pupils within the compulsory age range (7–15) must however be taught Scripture.

Private schools for pupils within the compulsory age range are allowed, their curricula and examinations being on the same footing as those of public schools. The very few private schools of this type are Roman Catholic or Adventist. There are some vocational schools, e.g., schools of commerce, pictorial art, drama, music, etc., which are run by organizations or individuals with the aid of grants from public funds. All private schools have to be licensed or approved by the Minister.

The Ministry of Education is in charge of the greater part of the educational system, but some vocational schools are run by other departments, e.g., agricultural schools come under the Ministry of Agriculture and the Nurses' Training School under the Ministry of Health.

The Ministry of Education appoints a Director of Education, who supervises the enforcement of laws and regulations, and collects information and statistics on education. The University of Iceland is, however, re-

sponsible directly to the Ministry of Education. The Director consults school boards on courses of study, examination standards, etc., in primary as well as in secondary schools.

Each of the 14 towns and 23 rural districts forms an educational district (*skólahérad*) and has an educational council elected by town councils and rural district councils respectively. Each educational district is composed of one or more school districts (*skólahverfi*), of which there are 220 in all, each with a school board consisting of either three or five persons. In most towns, however, the work of school boards is done by the educational council. The chairman of a school board is appointed by the Minister of Education, whilst the other members are elected by the local authorities. All public schools which are jointly financed by the State and the local authorities, come under the administration of school boards and educational councils. Headmasters and teachers are appointed by the Minister on the advice of the school board concerned and the Director of Education. Upper secondary schools and such vocational schools as are entirely financed by the State are administered directly by the respective ministries, assisted in specialized matters by advisory committees.

The diagram on page 643 shows the structure of the Icelandic school system.

THE DEVELOPMENT OF SECONDARY EDUCATION

Church schools (*latínuskólar*) dating back to medieval times long played a role similar to that of present-day secondary schools. The *latínuskólar* were closed down in 1800 when a secondary school with a 6-year course was founded in Reykjavik. In 1904 this school was divided into lower and upper stages, each lasting 3 years, and its name was changed to *menntaskóli*. The first Act regulating *menntaskólar* was passed in 1930. In 1946 a new Act establishing 4-year *menntaskólar* was passed and this is still in force with only minor changes.

There were no schools in Iceland corresponding to the lower secondary school of today until about 1880, when the first of such schools, offering a 2-year course, was founded. The curricula were patterned on those of parallel schools in Denmark.

At the turn of the century general interest in the junior stage of secondary education increased, especially after compulsory school attendance between the ages of 10 and 14 was introduced by law in 1907. By that year various secondary schools had been set up with courses of a few weeks' duration in Icelandic, mathematics, Danish; also in English and other subjects. In 1930 a new Lower Secondary Schools Act was passed, under which the length of the lower secondary school course was fixed at 3 years. Many of the subjects were the same as in the lower secondary school sections of the *menntaskólar*.

During the first decade of this century there was some interest in the establishment of folk high schools on the pattern of those which had for some time been in operation in Denmark, and three were in operation when the District School Act was passed in 1929 establishing a 2-year 'district school' course and prescribing a curriculum similar to that of the earlier folk high schools. In 1946 a new Act on lower secondary education was passed. The district schools were transformed from folk high schools into lower secondary schools, giving their pupils opportunities for entry to further education similar to those offered by the lower secondary schools of the towns. In this connexion it may be mentioned that there is now considerable interest in the foundation of a school patterned on the folk high schools, which would be independent of the rest of the school system.

Towards the end of the nineteenth century a 1-year continuation course for the training of teachers was introduced at the lower secondary school in the south of Iceland. This arrangement continued until 1908, when the Teachers' Training College of Iceland was founded under the 1907 Act. In 1944 the course was extended to 4 years and entrance standards raised, and under the 1947 Act (which is still in force) entrance was made subject to the same qualifications as were required for entering upper secondary schools. Training colleges for teachers of specialized subjects were established: for teachers of handicrafts in 1939, for teachers of physical education and teachers of domestic science in 1942, and for teachers of music in 1958.

In the last three decades of the nineteenth century a number of domestic science and agricultural schools were founded. The Agricultural School Act was revised in 1937 and a new Domestic Science School Act was passed in 1946, superseding previous legislation.

The first technical school in Iceland was opened in Reykjavik in 1904 and others were later set up in various towns. They were founded by artisans, or by artisans' organizations, and usually the schools were operated as evening schools, the pupils receiving their practical training through their daytime employment. The courses of study varied in accordance with the requirements of local industry. In 1955 a Technical Education Act was passed. Technical schools are now usually day schools, financed jointly by the State and the local authorities. Attempts are being made to bring practical training in important trades within the schools themselves as much as possible.

The Commercial College of Iceland (*Verzlunarskóli Íslands*) was founded in Reykjavik in 1904 by business organizations, and the Co-operative School (*Samvinnuskólinn*) in 1918 by the co-operative movement. No statutory laws exist on these schools, except that in the Upper Secondary School (*Menntaskóli*) Act there is a provision that gives the Commercial College of Iceland the right to confer matriculation (granting university entrance).

A navigation school (*stýrimannaskóli*) was founded in 1890, and a training school for engineers (*vélstjóraskóli*) in 1915. The latter was for a long time operated in conjunction with the navigation school, its chief function being to train engineers for the merchant navy and the fishing fleet. Under the 1936 Act this school offers more varied engineering courses, including a course in electrical engineering. Its name was also changed to the Engineering School (*Vélskólinn*).

Administration

The Education Acts governing the various types of secondary schools have been referred to above. They stipulate which subjects should be included in each course, but do

not expressly state what each subject should cover, leaving further details of the curricula for special regulations; the same applies to examinations. The drafting of new curricula regulations can begin from proposals made by teachers or be initiated by the Ministry and the Director of Education. In the latter event teachers and other educationists are consulted, and all final drafts are tried out in the schools and suitably amended before being submitted to the Minister of Education for signature.

The more general aspects of school administration have already been described. The Director of Education directly supervises schools as far as it is in his power, but for advising on teaching methods, supervising the day-to-day work, etc., he is assisted by school inspectors, both for general and specialized subjects. There are 10 of these inspectors, mainly for primary schools, the lower general secondary schools, and domestic science schools. There are no inspectors for upper secondary schools and vocational schools.

As stated above, most Icelandic schools are built and financed by the State and local authorities, or by the State alone. Lower secondary schools, technical schools and domestic science schools receive state grants covering one half of their foundation costs, all salaries of permanent staff and one half of 'miscellaneous' operational costs. Upper secondary schools, teacher training colleges, nautical schools and other special schools are provided and maintained entirely by the State. The commercial schools are run by business organizations and co-operatives, receiving small subsidies from public funds. Schools of music, handicrafts and arts, and study groups, are set up by associations and individuals; they usually receive grants from public funds, and some of them also receive small subsidies from local authorities.

Owing to the fact that many rural areas of Iceland are very sparsely populated, a number of boarding schools have been established. If the parents or guardians of a child subject to compulsory education cannot afford to pay the cost of its stay in a boarding school, this is met by public funds like other expenses in connexion with the childs education. All pupils within the compulsory age range (7–15) receive textbooks free of charge, issued by the State Educational Publishing Department.

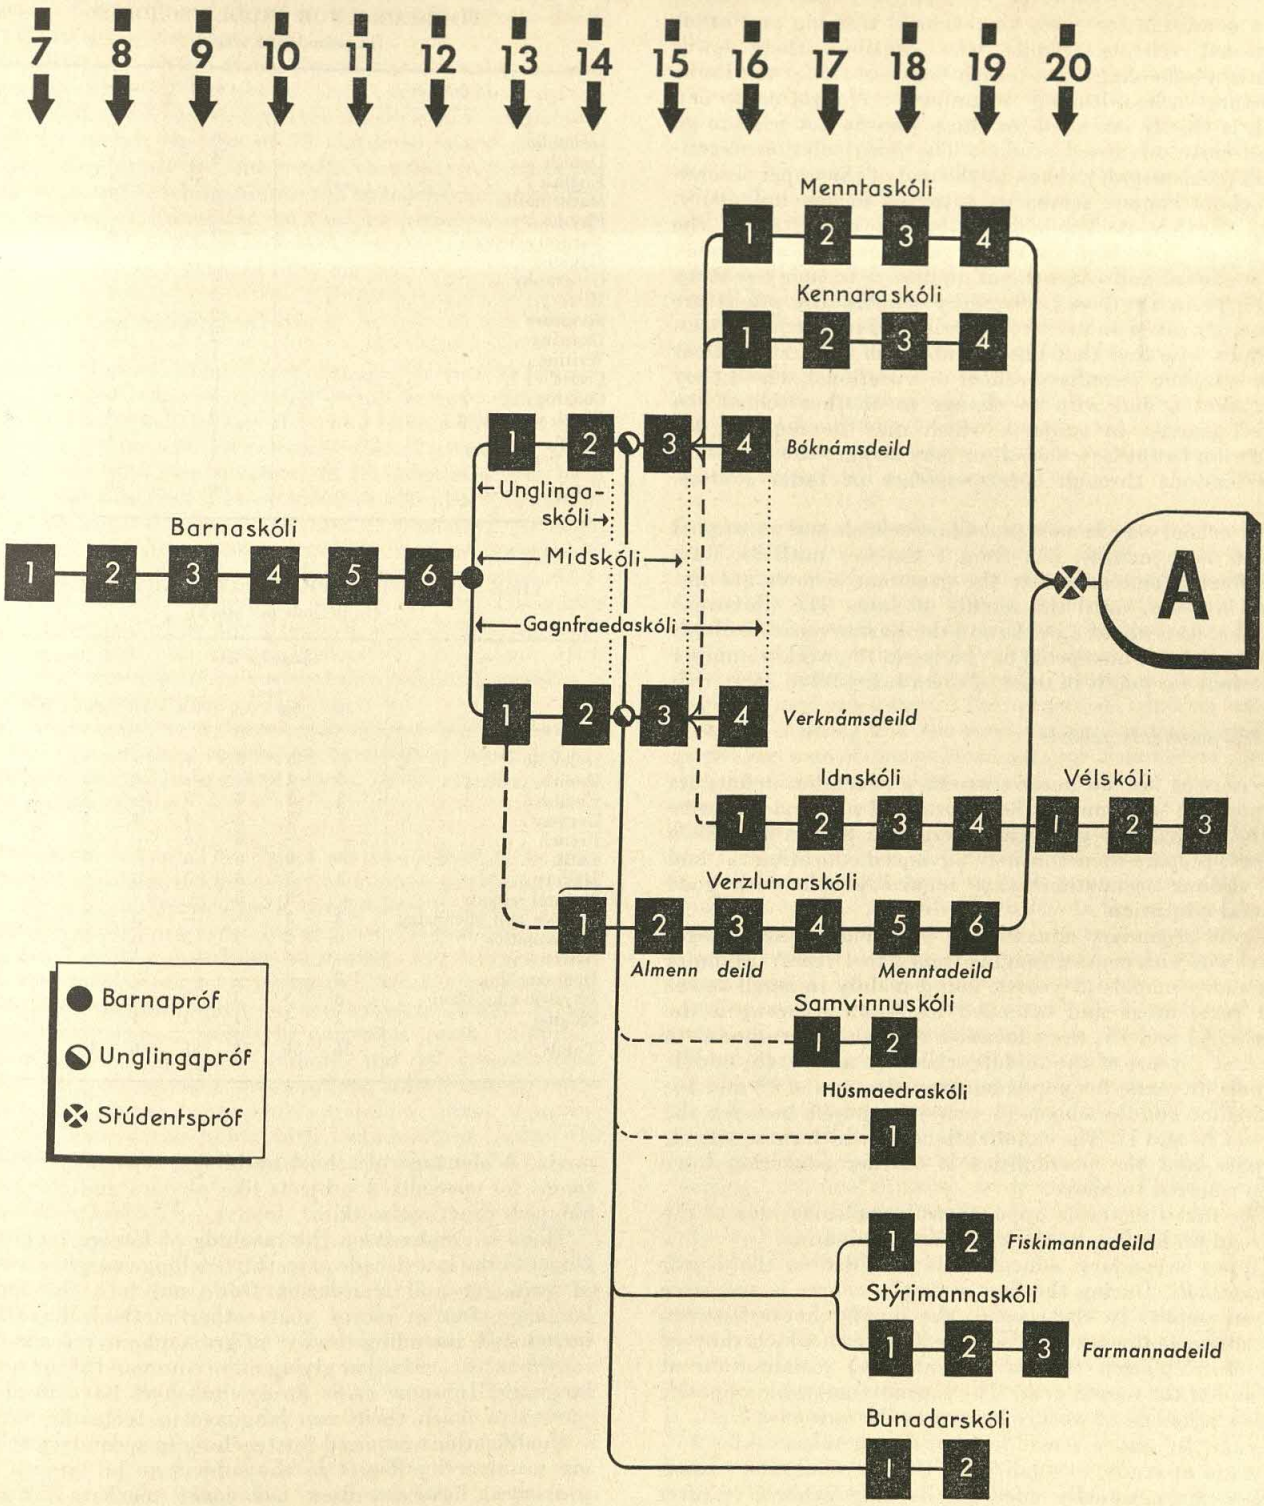
All designs for schools are subject to the approval of the State Architect and the Director of Education, after which they have to be accepted by the Ministry of Education. Most schools are designed in the offices of the State Architect. The size of a school will of course depend on the number of pupils in its area, but the size of schoolrooms provides a good seating capacity for 30 children on the average, being 45–50 square metres. The present official policy is to limit the schools to 400 pupils. Every school of average size must have a gymnasium, rooms for handicrafts, health service, library, etc. Swimming pools are provided wherever possible. If possible, special rooms are provided for science teaching. Heating, lighting and sanitation are similar to those of Middle and North European schools.

A special Medical Inspector of Health for Schools supervises all matters relating to the health of the school population, and the State Inspector of Physical Education supervises and gives advice on physical training. The latter official, for instance, sees to it that the law on swimming as a compulsory subject is enforced.

TYPES OF SECONDARY EDUCATION

At the end of the primary school (*barnaskóli*) the pupil passes into the lower secondary schools (*gagnfraedoskólar*) which are divided into two streams: academic (*bóknámsdeild*) and practical (*verknámsdeild*). The junior secondary stage (*unglingaskóli*) takes over compulsory education for 2 years, going up to the age of 15. (Some country school areas have been granted special permission to end compulsory education at the age of 14.) Compulsory education is wound up by the junior secondary school-leaving examination (*unglingapróf*); successful candidates may attempt the entrance examinations for technical schools. A third year of lower secondary education in the academic stream leads to the middle school examination (*midskólapróf*), a good pass in which secures admission to the 4-year upper secondary school (*menntaskóli*). This examination is

GLOSSARY



almenn deild: see *verzlunarskóli.*
barnaskóli: primary school.
bóknámsdeild: academic stream in lower general secondary schools.
búnadarskóli: vocational training school of agriculture.
fiskimannadeild: see *stýrimannaskóli.*
farmannadeild: see *stýrimannaskóli.*
gagnfraedaskóli: 4-year lower general secondary school.
húsmaedraskóli: vocational training school of home economics.
idnskóli: part-time vocational training school for apprentices.
kennaraskóli: teacher training school.
menntadeild: see *verzlunarskóli.*
menntaskóli: upper general secondary school of academic or grammar type.
midskóli: 3-year lower general secondary school.
samvinnuskóli: vocational training school in co-operatives.
stýrimannaskóli: vocational training school of navigation with courses for fishermen (*fiskimannadeild*) and seamen (*farmannadeild*).
unglingaskóli: 2-year lower general secondary school falling within the compulsory education period.
vélskóli: advanced vocational training school for engineering technicians.
verknámsdeild: practical stream in lower general secondary school.
verzlunarskóli: vocational secondary school of commerce with two cycles, general (*almenn deild*) and specialized or academic (*menntadeild*).

HIGHER EDUCATION

A. *Háskóli:* university.

EXAMINATIONS

barnapróf: primary school certificate.
stúdentspróf: university entrance.
unglingapróf: lower secondary school leaving certificate.

also a condition for entry to teachers' training and other vocational schools. Pupils who continue their lower secondary schooling for a fourth year can sit for the lower secondary school-leaving examination (*gagnfraedaprof*), which is chiefly intended for those who do not wish to go in for more advanced studies. The Matriculation examination (*studentsprof*), taken at the end of the upper secondary school course, serves as entrance to the university.

The Reykjavik Municipality (where two-fifths of the population of Iceland are congregated) employs a specialist in vocational and educational guidance. In many schools, especially in the lower secondary schools, the pupils are frequently taken on tours to factories and industrial centres.

Pupils who find that they do not wish to carry on their studies in the secondary school or vocational school they have chosen and wish to change to another school can attend courses in subjects which may be required for admission to the new school, or may acquire the necessary qualifications through correspondence or radio courses, etc.

The school year in most secondary schools and vocational schools is 8 months, i.e., from 1 October until 31 May. The final examinations at the grammar schools are not over, however, until the middle of June. The Christmas vacation lasts about 2 weeks and the Easter vacation about a week. Schools are open 6 days a week, the weekly number of periods for pupils in most of them being 33 to 36.

General secondary schools

The present law on lower secondary education defines its purpose as: 'to promote the mental and physical maturity of the pupils, give them the instruction that is laid down by law, prepare them for more advanced education . . . and for various occupations that require people with good general education'.

Lower secondary education is provided in three stages or schools with courses ranging from 2 to 4 years: (a) junior secondary schools (2 years), found mainly in small towns and rural areas and attended by children between the ages of 13 and 15; the education they give corresponds to the first 2 years of the middle schools (b and c); (b) middle schools (3 years) for pupils between the ages of 13 and 16; (c) higher middle schools (4 years) for pupils between the ages of 13 and 17. The examinations for which these schools prepare and the possibilities of further education have been referred to above.

The first time-table opposite will give some idea of the curriculum leading to the *midskóli* examination.

Upper secondary education is provided in the 4-year *menntaskóli*. During the first year the course is the same for all pupils. In the second, the pupils choose between the language line and the science line, from which they sit the Matriculation (university entrance) examination at the end of the fourth year. The second time-table opposite gives a schedule of weekly lessons in the *menntaskóli*.

From the above it will be seen that it takes 6+3+4 = 13 years of study to qualify for the Matriculation examination. Exceptionally good pupils may achieve it after 11 or 12 years.

Teaching methods in secondary and vocational schools in Iceland are broadly speaking similar to those in Scandinavia. A shortage of school buildings, especially of classrooms for specialized subjects like physics and chemistry, hampers practical work.

There is emphasis on the teaching of foreign languages. Down to the last decade or so the teaching consisted mainly of grammar and translation from and into the foreign language, but in recent years other methods have been introduced, including the use of gramophone records, tape recorders, etc., aimed at giving more command of the spoken language. In some cases foreign teachers have been employed to teach their own language in Icelandic schools.

Qualifications required for teaching in secondary schools are a university degree in the subject to be taught. This provision, however, does not cover teachers for some special subjects, such as cooking, handicrafts, and physical training.

In the lower general secondary schools and other parallel

schools teachers have to teach a basic number of 30 periods a week, decreasing to 25 when they reach the age of 55 and to 20 when they turn 60.

Teachers may retire at the age of 65, when they receive a pension (about 60 per cent of their average salary during the preceding 10 years), but retirement is not compulsory until they reach the age of 70. After 10 years' service a teacher may apply for one year's vacation to further his knowledge and teaching abilities. The teacher must consult the Director of Education on how he plans to spend his vacation; most teachers undertake studies overseas. Such a vacation can be obtained only once.

Vocational and technical schools

Agricultural schools. The object of these schools is to provide practical knowledge of farming. Applicants for admission must have reached the age of 18 and have completed their compulsory education. The course lasts 2 years, or rather two winters and one summer. It includes study of both theory and practice. The curriculum comprises Icelandic, mathematics, sociology, physics, chemistry, geology, physiology, physical training, and the various branches of agricultural science proper such as agricultural economics, veterinary science, methods of cultivation, etc. The pupils are also instructed in the practical side of farming, agriculture, horticulture, animal husbandry, and so on. After the final examinations, successful candidates receive a diploma in agriculture.

An advanced 2-year course leading to a higher diploma is held in one of the two schools. In addition, short courses are offered annually in many places, under the auspices of the Farmers' Union.

Horticultural school. The object of this school is to give its pupils specialized knowledge of market gardening. The 2-year course comprises both theory and practice. To be admitted applicants must be at least 17 years old, have completed their compulsory education, and have worked for at least 2 years in a recognized market garden. The curriculum includes most of the subjects taught in the agricultural schools, and the practical work comprises market gardening (both outside and in greenhouses), layout of gardens and greenhouses, afforestation, cultivation of flowers, fruits and vegetables, plant diseases, etc. The course concludes with examinations, successful candidates becoming fully qualified horticulturalists.

Nautical school. The school trains ships' officers. The following courses can be taken: (a) 4 months' training for the First Fisherman's Certificate; (b) 2 years' training for the Second Fisherman's Certificate; (c) 3 years' training for the Mate's Certificate; (d) special training for the Master's Certificate for State Patrol Vessels; this course lasts at least 4 months after the completion of the Mate's Certificate. To be admitted to the Nautical School applicants must be at least 18 years of age, have completed their compulsory schooling, and have been members of a ship's crew for at least 24 months. The course for the Mate's Certificate includes mathematics, navigation, Icelandic, Danish, English, maritime law, hygiene, bookkeeping, economics, physics, mechanical engineering, geography and meteorology, seamanship and physical training.

Mechanical Engineering School. The school trains engineers for ships and mechanics for factories, electric power stations, etc., preparing its pupils for the Mechanic's Certificate, the Electrician's Certificate for mechanics, and the Electrician's Certificate for electricians. Applicants for admission must have completed a 4-year apprenticeship and passed final examinations at a technical college.

Hotel and Catering School. The length of the course is 3 years. To be admitted to the school applicants must have reached the age of 16 and passed the middle school examination. The curriculum includes Icelandic, English, book-keeping, physics and chemistry, handwriting, Danish, mathematics, drawing and French, as well as vocational subjects. In addition, 4-month courses for cooks on fishing vessels and merchant ships are held at the school. Other courses are offered as the occasion arises.

Domestic science schools. The length of the course is approximately 9 months. Entrance requirements are a minimum age of 17 years and completion of compulsory education. The teaching is both theoretical and practical. On the theoretical side the following subjects are taught: Icelandic, Scripture, child psychology and education, dietetics, materials and utensils, household accounting, hygiene, and sociology. The practical teaching covers cookery, cleaning and washing, sewing, knitting, mending, gardening, care of domestic animals, etc. Short extra courses are also arranged at these schools.

Technical schools. These are attended by pupils who are contracted to masters or industrial concerns as apprentices in accordance with law. Special preparatory and continuation courses may also be held. As far as possible the teaching programme is arranged in 2 to 3-month daytime courses. Otherwise there are evening courses which cover longer periods of time, in which case the apprentice's working week is reduced by 12 hours. To be admitted to a technical school applicants must have reached the age of 15 and passed the middle school examination.

Subjects taken in the apprenticeship course, which may be of 3, 4 or 5 years' duration, include: Icelandic, a foreign language, mathematics, physics, chemistry, handwriting, book-keeping, geometric drawing, cubic drawing, artistic drawing, technical drawing, trade training. The curriculum may vary for different trades; in each case it has to be approved by the council for Technical Education and the National Union of Artisans.

Commercial schools. There is no apprenticeship in conjunction with these schools. The Commercial College of Iceland offers a 4-year course for boys and girls of 14 to 18 years of age, leading to a commercial diploma. There is also an advanced 2-year post-diploma course, leading to Matriculation. Hence, the aim of the college is on the one hand to give the theoretical and practical training that is required for commercial occupations of any kind, and on the other to provide an opening for university education. Short study courses may also be arranged, either in general

subjects like languages or in specialized subjects like salesmanship, etc.

The table below shows the curriculum and the weekly number of periods for each subject.

The Co-operative School, a 2-year boarding school in the country, provides a commercial course with particular attention to the history and special function of co-operative societies. To be admitted to the school applicants should preferably be not under 18 years of age and have completed the middle school or received education of a similar standard.

The subjects taught are: Icelandic, Danish, English, German, economics, book-keeping, typewriting, commercial arithmetic, commercial law, commodities, salesmanship, secretarial work, advertising copywriting and window display, cultural history, history of the co-operative movement, conference procedures.

Teacher training schools

The training of teachers for the primary and the junior secondary stage takes place in the Teachers' Training College of Iceland. Entrants who have passed the middle school examination take a 4-year course, while those who have passed the Matriculation examination take a 1-year course.

The curriculum of the 4-year course includes Icelandic, Danish, English, German, mathematics, natural history, physics, Icelandic history, world history, history of education, geography, handicrafts, singing, Scripture education, teaching methods, teaching practice, hygiene, drawing, handwriting, and physical training. The 1-year course includes only the eight last-named subjects.

The Training College for Teachers of Physical Education is located in the country. The length of the course is 9 to 10 months. Short courses for the general public may also be held. The aim of the school is twofold: (a) training of teachers of physical education for all schools financed by public funds; (b) training of coaches for the requirements of clubs, organizations or individuals.

The Training College for Teachers of Domestic Science also has two aims: (a) training of teachers of domestic science for domestic science colleges and secondary schools (2-year course); (b) training of matrons for boarding schools and other institutions (1-year course). The following subjects are taught: theoretical—dietetics, materials and utensils, and household accounting; practical—cookery, cleaning and washing, gardening, care of domestic animals and farm produce, mothercraft, and teaching practice. Special regulations lay down in detail what each subject should cover, as well as the scope and nature of examinations and grading.

The Training College for Teachers of Handicrafts is operated in conjunction with the Teachers' Training College of Iceland. The length of the course for those who wish to become teachers of handicrafts in primary schools is 1 year (the school year is 8 to 9 months), and in secondary schools 2 years. The curriculum includes the following subjects: Icelandic, education, hygiene, history of art, materials, teaching practice. In addition women students take model drawing, costume designing, sewing, knitting and crocheting, weaving, hobbies, book-keeping; and men take artistic drawing, technical drawing, carpentry, metalwork, book-binding.

Candidates for final examinations in training colleges for teachers of specialized subjects, such as physical education, handicrafts, cookery, etc., are required by law to have completed the Teachers' Training College of Iceland. Owing to the great shortage of teachers of some special subjects, exemptions have been granted from this provision so that in some cases the specialized training colleges have enrolled students who have completed technical education, a course in a domestic science college, passed the middle school examination, etc.

Teachers of drawing and of music and singing receive their training in the School of Arts and Crafts and the Reykjavik College of Music respectively. If students have not already completed the Teachers' Training College of Iceland they have to attend it for courses in education, psychology, teaching methods, hygiene, etc.

Miscellaneous schools

The Nurses' Training School is a boarding school run by the State in conjunction with the National Hospital. Entrants must be between 20 and 30 years of age, in good health, and mentally and physically suited for their vocation. They must hold the middle school certificate or have equivalent qualifications.

Schools of music are now fairly numerous, mainly in towns and some large villages. Founded by patrons of music and by music associations, they receive some grants from the State towards operational costs. The Reykjavik College of Music is by far the largest, having courses for most of the instruments that are required for a symphony orchestra.

The School for Arts and Crafts is located in Reykjavik. It offers courses in drawing, painting, lithography, etc.

Elementary sculpturing and modelling may also be included. This school is attended by those who wish to make art their career and by those who intend to become industrial designers or art teachers. There are also courses in handicrafts, such as book-binding, weaving, etc.

The National Theatre in Reykjavik runs a school of dramatic art. The courses of study are similar to those of parallel schools in Scandinavia and Great Britain.

Adult education

Adult education classes are held in several places throughout the country. There are both elementary and advanced courses in a great variety of subjects for both young and old. Most of them are evening classes, attended partly by people who simply want to improve their general education and partly by students who wish to qualify themselves for admission to higher schools.

Correspondence courses of various kinds are run by the Iceland Co-operative Societies. The State Broadcasting Service offers various courses, mainly in Icelandic and foreign languages; these broadcasts cover the same sort of ground as the adult education classes and the correspondence courses. In addition, miscellaneous courses are offered by individuals and private organizations in many parts of the country.

Out-of-class activities

In all secondary schools there are various clubs and societies, such as sports clubs, chess clubs, dramatic societies, debating societies, etc. The officials of such societies are assisted by headmasters and teachers when required, and the headmasters often seek the co-operation of such societies for the promotion of cultural activities in the schools.

TRENDS AND PROBLEMS

A fairly large number of Icelandic teachers in secondary schools go overseas either to further their knowledge in their own particular field, or to acquaint themselves with education abroad. In this way many new trends in education abroad reach Iceland fairly soon, and attempts are made to adapt them to local requirements. Regulations and curricula undergo periodical revision in the light of the experience of teachers and the needs of the school population at large.

The present official policy aims at increasing the scope of optional subjects in general schools, especially in view of the increasing number of subjects the schools have to teach and the constantly expanding content, particularly as a result of growing industrialization. A shortage of school buildings stands in the way of rapid progress in this field, however, and there is also a shortage of specialized teachers. It may be mentioned that proposals have been advanced for the raising of the minimum age of entrants to the school that trains teachers for the primary and the junior secondary school stage, so that they would be at least 21 to 22 years old when they qualified as teachers. An extension (from 1 to 2 years) of the course in the Teachers' Training College for grammar school graduates is also under consideration.

[*Text prepared by the Ministry of Education, Reykjavik, in October 1959.*]

STATISTICS

Population (mid-year 1958 estimate): 169,000.
Area: 39,800 square miles; 103,000 square kilometres.
Population density: 4 per square mile; 1.6 per square kilometre.

Summary of school statistics, 1951–55. According to the data available, some 28,600 pupils were enrolled in educational institutions at all levels in 1955, representing approximately 18 per cent of the population. Of the total enrolment, 66 per cent were pupils in primary and special schools, 22 per cent in general secondary schools and teacher training schools, 9 per cent in vocational education and the remainder, 3 per cent, were students at the university. Including auxiliary staff, the number of teachers at all educational levels in 1955 was 1,620. The pupil-teacher ratio, including auxiliary staff, was 24 at primary schools and 14 in general secondary schools. Compared with 1951, enrolment at all educational institutions had increased by about 19 per cent. (See Table.)

Educational finance, 1956. Data available for 1956 show that total expenditure on education was 114,266,062 kroner (official exchange rate: 100 kroner = 6.1 U.S. dollars [approx.]), representing over 700 kroner per inhabitant. Of the total spent, 82.9 million kroner or 73 per cent was derived from the central government budget for public education and 31.3 million kroner, 27 per cent, from subsidies allocated by the local authorities.

1. Including auxiliary teachers.
2. Not including itinerant schools.
3. Teachers in junior secondary schools and part of the teachers in middle schools are included with those of the primary schools to which they are attached.
4. Not including part-time teachers who numbered 151 (F. 56) in 1954, nor teachers in junior secondary schools, who are included with those of primary schools.
5. Not including part-time teachers who numbered 212 (F. 30) in 1954.
6. Including pupils in art and music schools and physical culture schools, who numbered 380 (F. 221) in 1954. Not including part-time pupils (250 in 1954).

THE EDUCATIONAL SYSTEM

The Constitution of India (a) directs the provision of universal, free and compulsory education for children up to the age of 14 years (Article 45); (b) precludes denial of education on grounds of religion, race, caste or language (Article 29); (c) promotes with special care the educational and economic interests of the weaker sections of the people, particularly scheduled castes and tribes (Article 46); (d) prohibits religious instruction in institutions maintained out of state funds and compulsion in any recognized institution to take part in any religious education (Article 28); and (e) gives all minorities the right to establish and administer educational institutions, and assures to them grant-in-aid without discrimination (Article 30).

The Government of India Act of 1919 introduced dyarchy in the Provinces. Till then education had been directly administered by the Government. But in the dyarchic system, education was one of the matters transferred to popular control, and since that time it has remained a provincial or state responsibility except for post-school technical and university education, which are the concern of the Central Government. The Central Ministry of Education, however, is responsible for all education in centrally administered areas.

In the States, the schools directly managed by the Government form a comparatively small proportion of the total number. The large majority are under the following kinds of management:

Local bodies (district boards, municipalities). Although the main concern of local bodies is primary education, some secondary schools in different States are also managed by them. Such schools are subsidized on scales and conditions varying from State to State.

Religious and other denominational bodies. These agencies are responsible for running a large number of educational institutions in the country. They have contributed greatly to the expansion of secondary education and the maintenance of efficient standards.

Registered trusts or societies. Many private schools are run by registered trusts or societies; these often constitute the most satisfactory form of private management.

Private bodies and individuals. Some schools in each State are run by private bodies or individuals who are the proprietors of the institutions. This kind of management is being gradually discouraged.

The diagram on page 651 shows the structure of the school system.

THE DEVELOPMENT OF SECONDARY EDUCATION

In the decade preceding 1900, according to the Recommendations of the Indian Education Commission of 1882 the Government of India withdrew from direct management of secondary schools. This led to private agencies playing a larger role in the field of secondary education. There was a rapid increase in the number of secondary schools, which, with English as the medium of teaching, imparted instruction through a unitary course of studies in which great emphasis was placed on literary subjects. From the establishment of the universities in 1857, secondary schools functioned merely as institutions preparing students for higher education. Although the Hunter Commission (1882) recommended that secondary schools should offer two 'avenues', literary and vocational, the recommendations did not produce any effect. The Indian Universities Act of 1904, by which secondary schools were to be recognized by universities, only strengthened the domination of the university.

1905–21: Post-Curzon period. Although Lord Curzon's policies were largely reversed by his successors, most of his educational programmes were held to be sound and progressive. Secondary schools were controlled by conditions prescribed for recognition by the Education Departments and by the university. Government policy also aimed at the improvement of secondary education by providing trained teachers, hostels, manual training, better science teaching, increased grants-in-aid and more training colleges (Resolution on Educational Policy, 1913).

At the same time, in response to the new movement to free secondary education from the sway of the university, some Provinces (States) set up Boards of Secondary Education, which framed syllabuses, instituted examinations and issued a School Leaving Certificate, on the basis of which pupils were to be admitted to colleges or the services. The School Leaving Certificate examination thus came into being as an alternative to the Matriculation.

The attempts made in this period to introduce and develop vocational and pre-vocational courses failed, largely owing to lack of planning and co-ordination. But one reform was carried out successfully, namely, the substitution of Indian languages for English as media of instruction in the middle schools.

The latter part of this period saw the beginning of a large expansion in the number of secondary schools.

1921–37: The period of dyarchy. By the Government of India Act of 1919, education, as a 'transferred subject', passed under the control of Indian ministers in the different State Governments. This, however, was accompanied by an almost complete withdrawal of the Government of India from the field of education. This 'divorce of the Government of India from education' as the Hartog Committee called it, cut off all co-ordination between the Provinces, and is largely responsible for the present wide variations between the States in educational policies, objectives, and types of institution. Although the Central

Advisory Board of Education, which had been abolished in 1923, was revived in 1935, it did not make any significant contribution in this direction. However, owing to an upsurge in political and social consciousness, educational institutions of all types expanded with remarkable rapidity. From 1922 to 1937, the number of secondary schools increased from 7,530 to 13,056, and the pupils from 1,106,803 to 2,287,872. The Indian languages were gradually supplanting English as media of instruction for most of the subjects of the high school classes.

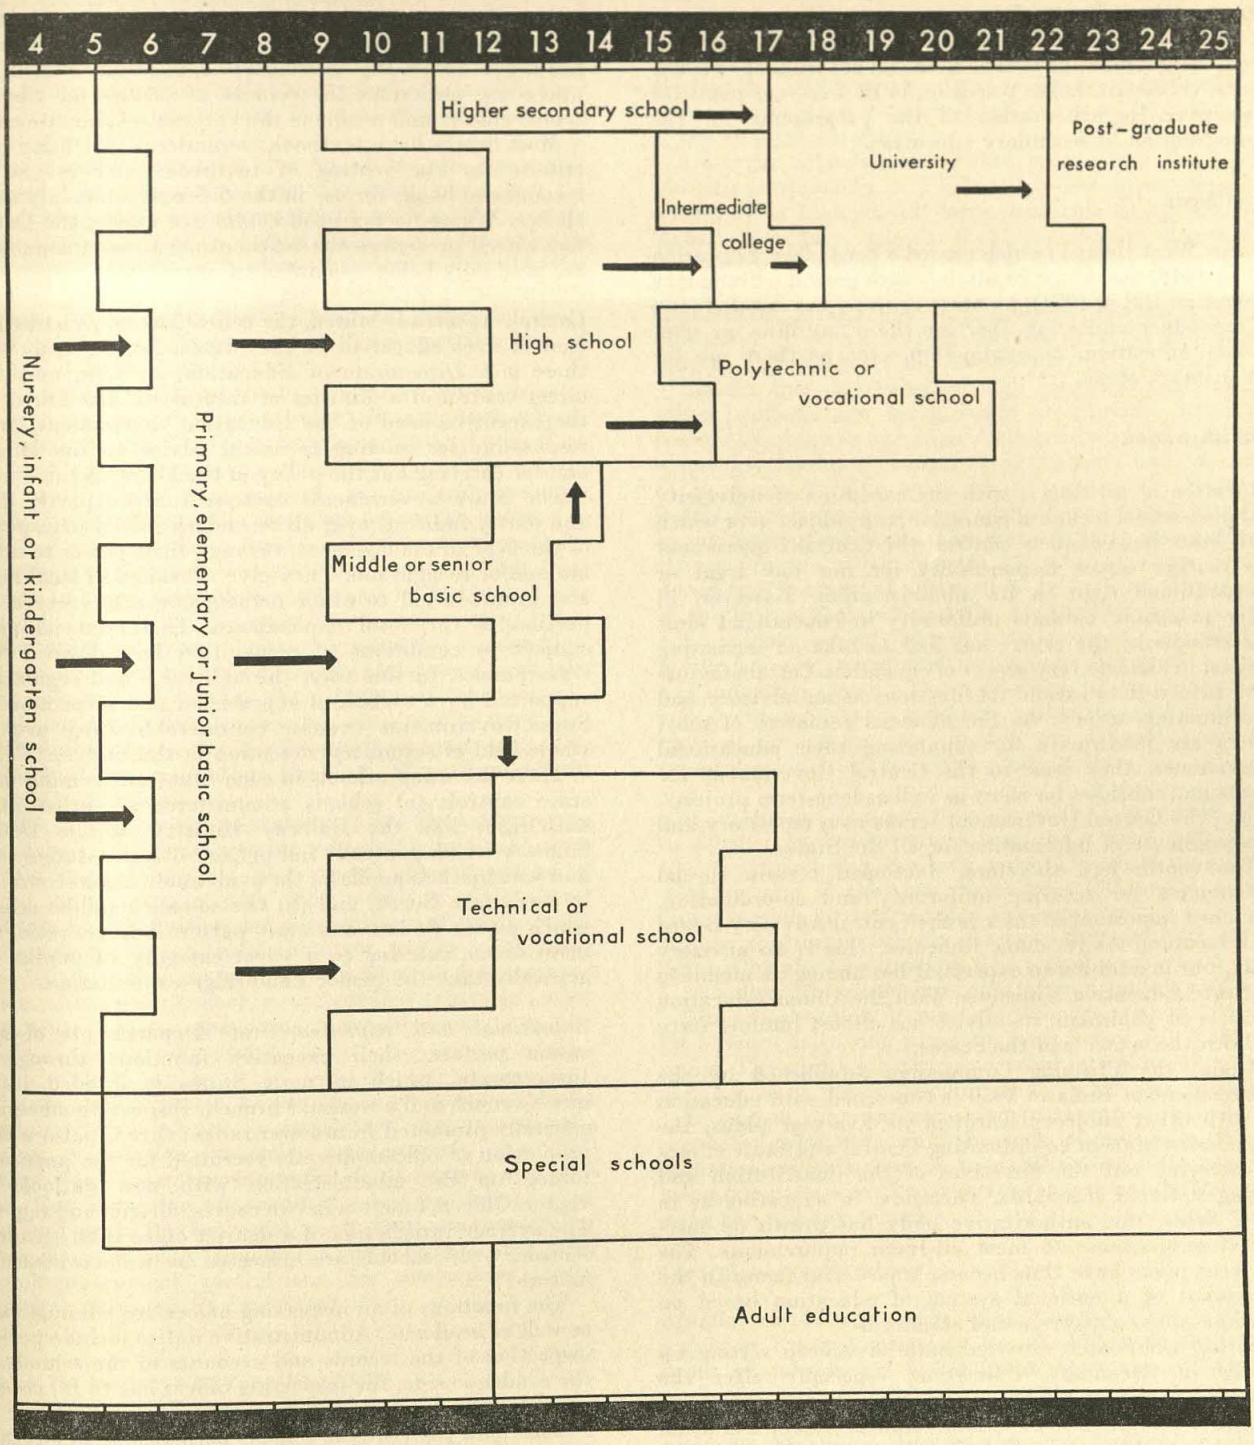
1937–47: Period of provincial autonomy. Provincial autonomy, which came into being under the Government of India Act of 1935, put an end to the dyarchic categories of 'reserved' and 'transferred' subjects, and introduced instead the new categories called 'Central' and 'State' subjects. Since by this reform the State acquired a considerable amount of freedom, one would have expected to find a striking advance in education during this decade. In actual fact, however, this was a period of slow development. The causes were (a) the preoccupation of the Government with the second world war; (b) political unrest in the country; and (c) the economic dislocations of the post-war period.

The economic factor had great repercussions on the development of education during this period. The rise in the cost of living, together with the increasing cost of education, particularly hit the middle classes from whom the secondary schools drew their main supply of pupils. The poorer classes could not afford secondary education, although they were becoming more and more education-conscious. Pupils in the secondary schools were, therefore, increasingly drawn from the well-to-do sections of society.

However, a few forward steps that were taken in this period may be recorded here. The mother tongue was accepted as the medium of instruction in secondary schools, and more and better textbooks in the Indian languages appeared. Technical, commercial and agricultural high schools were started by State Governments and grants-in-aid were increased in respect of non-literary courses.

1947–55; Secondary education programmes on an All-India scale. Educational reconstruction, which had received very little impetus under provincial autonomy, gathered momentum with the formation of the first Federal Ministry of Education in 1946. The States began actively to initiate reforms. Many of them appointed committees to suggest new measures of reform and reconstruction. In 1948, the Central Advisory Board of Education examined the whole field of secondary education, and resolved that a commission be appointed by the Government of India to (a) review the present position of secondary education in India, and (b) to make recommendations in regard to the various problems related thereto. This resulted in the appointment of the Tara Chand Committee, whose report was considered by the Central Advisory Board in 1949, which again urged the appointment of a commission to examine the whole subject of the aims, objectives and purposes of secondary education and its relation to basic and university education. Meanwhile, the University Education Commission appointed in 1948 under Dr. S. Radhakrishnan made a review of secondary education in its report, and recommended that the standard of admission to the university should correspond to that of the present Intermediate Examination, i.e. after 12 years' schooling.

In 1952, the Government appointed a Secondary Education Commission (chairman, Dr. A. Lakshmanaswami Mudaliar) which, after a comprehensive survey and study, submitted its report in 1953. The far-reaching proposals made in this report have been generally accepted by the State Governments and by the Central Advisory Board.



The general pattern of secondary education as envisaged in the Mudaliar Commission Report, and as approved by the Central Advisory Board, is as follows: (a) 8 years of integrated elementary (basic) education; (b) 3 (or 4) years of secondary education, through diversified courses of study, in which the first year will explore and determine the pupil's aptitude and the next 2 (or 3) years constitute his full study; and (c) 3 years of university education for the first degree after the higher secondary school.

In view of the national scale and character of secondary education, and in accordance with the Secondary Education Commission Report and its acceptance by the Central Advisory Board, the Government of India assumed a certain measure of direct responsibility, and set up an All-India Council for Secondary Education consisting of representatives of Central and State Governments and educational authorities. The main function of this body is to make available to the Central and State Governments concrete proposals for secondary education reform and

GLOSSARY

NOTE. Educational systems in India vary from State to State. The diagram shows the main types of school found throughout the country, the variations in ages of attendance and the general lines of progression (indicated by arrows).

elementary school: see *primary school* below.
high school: general secondary school.
higher secondary school: general secondary school including 1-year post-secondary course leading direct to university.
intermediate college: non-degree-granting college, providing transitional course from secondary school to university. Some degree-granting institutions include intermediate classes.
junior basic school: craft-centred lower primary school.
middle school: lower general secondary school.
nursery, infant or kindergarten school: pre-primary school.
polytechnic or vocational school: technical college.
primary or elementary school: primary school varying in organization from State to State.
senior basic school: craft-centred experimental upper primary school.
special schools: schools for the handicapped or for juvenile delinquents.
technical or vocational school: vocational secondary or vocational training school.
university: degree-granting universities and colleges including faculties of arts, science, engineering and medicine.

Adult education

reconstruction. Engaged in a country-wide programme, the All-India Council for Secondary Education is assisted by expert guidance as well as financial aid from the centre. The Government makes provision in its five-year plans for progressive implementation of the programme for the reconstruction of secondary education.

Legal basis

Except West Bengal (which passed a Secondary Education Act in 1948) and Uttar Pradesh (which passed a Secondary Education Bill in 1921), no State in India has enacted laws on secondary education. Nor are there any laws on compulsory education, apprenticeship, etc., as there are for the primary stage.

Administration

Education at all stages, with the exception of university and post-school technical education, is a subject over which each State has complete control; the Central Government has neither direct responsibility for, nor any legal or constitutional right in its administration. However, in order to ensure national uniformity in educational aims and standards, the centre has had to take an increasing interest in almost every aspect of education. Certain factors have helped it to extend its functions as an advisory and co-ordinating agency. As the financial resources of most States are inadequate for supporting their educational programmes, they look to the Central Government for grants and subsidies for short as well as long-term projects. Again, the Central Government serves as a repository and clearing house of information for all the States.

The centre has, therefore, developed certain special instruments for securing uniformity and co-ordination. The most important of these is the Central Advisory Board of Education. As its name indicates, this is an advisory body, but in addition to experts, it has among its members all State Education Ministers. With the Union Education Minister as chairman, its advice has almost binding force on both the centre and the States.

Again, the Planning Commission established by the Government of India in 1950 is concerned with education as with other subjects. Through its five-year plans, the commission aims at co-ordinating Central and State efforts for carrying out the directives of the Constitution and raising national standards. Therefore, in education as in other fields, this authoritative body has drawn up integrated programmes to meet all-India requirements. The five-year plans have thus become a powerful factor in the promotion of a national system of education based on common aims, objectives and standards.

Within the States, Governments have been setting up Boards of Secondary Education, especially after the recommendation of the Secondary Education Commission, and now—except in the Punjab, Tripura, Assam Himachal Pradesh and Manipur—all States have such boards. The boards are mainly advisory in character; they include secondary school teachers and headmasters, and representatives of the universities. Through their syllabus committees, they frame and recommend curricula for approval by the Government and they also conduct the final school leaving examination. In the States which have yet to set up Secondary Education Boards, the university prescribes the courses of studies for the high school classes and conducts the external examination.

Most States have textbook committees which lay down criteria for the writing of textbooks and review and recommend books for use in the different secondary school classes. Where no textbook committee exists, the Department itself prescribes the textbooks, but such committees are gradually being appointed in every State.

Control. As already stated, the centre has no constitutional control over education in the States. At the state level, there is a Directorate of Education, working under the direct control of a Minister of Education. The Director is the executive head of the Education Department, and is responsible for offering technical advice to the Minister and for carrying out the policy of the Department.

The State Governments exercise control, partly direct and partly indirect, over all secondary schools irrespective of the type of management, through their power to accord aid and/or recognition. They give subsidies to local bodies and grants-in-aid to other managements to meet a proportion of the total expenditure. This financial aid is subject to conditions of recognition laid down by the Government. In this way, through rules and regulations, supported by a system of supervision and inspection, the State Governments exercise considerable sway over the whole field of secondary education in the States.

There are a few schools in each State not coming under state control: (a) schools administered by other public authorities like the Railway Ministry or the Defence Ministry which generally fall in line with the state system, and send up their pupils for the final examinations conducted by the State Board, and (b) the so-called public schools, which do not fit into any state pattern but are residential institutions, catering to a select category of pupils, who generally take the Senior Cambridge examination.

Supervision and inspection. State Departments of Education perform their executive functions through an Inspectorate, which in most States is divided into a men's branch and a women's branch. Inspecting officers are generally promoted from lower ranks; there is also a small proportion of officers directly recruited for the purpose of toning up the administration with new outlook and vigour. Officers function in two cadres, district and regional. The average jurisdiction of a district office is 60 secondary schools. Girls' schools are inspected by women inspecting officers.

The functions of an inspecting officer are administrative as well as academic. Administrative duties include periodic inspection of the records and accounts of the schools. On the academic side, the inspecting officer has to (a) conduct annual inspections and assess the achievements of the schools, and (b) visit the schools periodically to advise on improved methods. The inspecting officer occupies a key-position in the Education Department. He is in direct and constant contact with the schools, and it is through him that all necessary information passes to the schools from the Department and to the Department from the schools.

Finance. Sources of revenue at the State level are: (a) government funds (grants); (b) district board and municipal board funds; (c) private endowments; and (d) fees. Government grants and fees account for more than four-fifths of the total income.

Grants-in-aid are made by the State to privately-managed institutions for the following purposes: (a) towards the salaries and allowances of teachers; (b) towards the rent and repair of the school building; (c) towards the expenditure on furniture, equipment and teaching materials; (d) for purchase, acquisition and extension of the school building; (e) for acquisition of land for school building, hostel building or playgrounds; (f) for meeting loss of income due to fee-concessions.

For payment of these grants, the States lay down conditions from time to time. Almost all secondary schools levy fees, the rate varying from one kind of school to another. Generally speaking, the rate is lowest in government institutions, and highest in privately-managed schools. In most States the fee-range for private schools in receipt of grants-in-aid is fixed by the Government. Some institutions prefer to do without such grants so that their freedom in the matter of fees may not be fettered. These are mostly schools for the upper classes, and in large cities.

All State Governments make provision for scholarships, stipends and fee-remissions for needy and deserving pupils. There are also scholarships for children of teachers, displaced persons, military personnel, etc., as also for pupils of scheduled castes and backward communities. A few scholarships are granted on the basis of performance at the public examination.

Scales of pay vary from State to State. The salary scales for teachers in privately-managed schools are laid down by the State Education Department, and payment of salaries in accordance with these scales is an essential condition for recognition and for payment of grants-in-aid to the schools. These scales, however, are in many cases lower than those enjoyed by teachers in government schools. Government teachers are entitled to pension after retirement, but non-government teachers only get the benefit of the provident fund.

Buildings and equipment. Conditions of recognition include minimum requirements in respect of accommodation, lighting, ventilation, sanitary arrangements, etc. The average floor space recommended is 10 square feet per pupil. But expansion of secondary education has been so great and rapid in the recent years that accommodation has become an acute problem. Capital grants are given to non-government institutions for constructing new buildings and renewing equipment.

TYPES OF SECONDARY EDUCATION

The secondary school comprises two stages, junior and senior. The former is also called the middle school or lower secondary school or, if it adopts the basic system, the senior basic school. The junior stage extends in most States over 3 years, and in a few States, 4 years. The senior stage, known as the high school, is spread over 3 to 4 years but, in some cases, where the middle school goes up to class 8, the high school consists of the last two classes—9 and 10. The middle school is generally attached to the high school so that the 6 or 7 years of the secondary stage form one course. Quite often the middle school classes form the apex of the elementary school.

After the introduction of the reorganized pattern of secondary education in 1955, two other types of senior secondary or high schools have been coming up, viz., the higher secondary school, and the (higher secondary) multi-purpose school. The higher secondary school adds one more year of study, which is expected to upgrade the standard of attainment of the school leavers. This additional year is taken from the first year of the former intermediate classes of the university.

Besides this upgrading of high into higher secondary schools, efforts are being made to provide diversified courses of study in the higher secondary schools, such as science, technology, commerce, agriculture, and fine arts, to meet the varying aptitudes, interests and talents of pupils. Such higher secondary schools are called multilateral or multi-purpose schools. The diversification into different streams begins at the age of 14 plus. In some States, diversified courses of instruction have been introduced in the high schools without the accompanying upgrading.

Secondary school leavers can proceed to colleges, polytechnics or vocational institutions like trade schools and industrial schools. Those who wish to join professional colleges in engineering, medicine, agriculture and commerce have at present to pass through the pre-university, the pre-professional or the intermediate courses.

The school year. This generally covers the period from June to April. It is divided into a long and a short term, June to December being the long term. The total number of working days in the year varies from 180 to 200, with a long vacation for summer and two short ones in mid-year. Within the terms, schools observe other public holidays notified by the Government. The school week varies from 5 to 6 days, the sixth day being often a half-day session.

The school ordinarily meets for 6 hours, with instruction for 5 hours daily, and provision for a longer and a shorter recess. The working hours are divided into 35 to 40 periods in the week, a period being of 40 or 45 minutes' duration.

In certain urban areas, owing to the great demand for secondary education and the lack of adequate accommodation, schools work in two shifts. The total hours of instruction per week in these schools are nearly the same as in the full-day schools.

General secondary schools

Middle schools and senior basic schools. These cater to pupils of the age group 10 to 13. Although both these types of schools are a continuation of the primary or junior basic stage and cover a similar educational programme, they adopt different methods of approach and teaching. The curriculum at this stage includes language and literature, social studies, general science, mathematics, citizenship training, art and music, craft and physical education. Languages taught include the mother tongue or the regional language, English in most States, and the national language Hindi (or any other Indian language

in areas where Hindi is also the regional language). The aim of instruction at this stage is to introduce the pupil in a general way to significant departments of human knowledge and activity.

The high school, higher secondary and multi-purpose schools. This stage covers the age group 14 to 17. Although the trend is to convert all high schools into higher secondary schools (see above), for the present there are both high schools and higher secondary schools functioning side by side. The high school curriculum, framed on the basis of abilities and interests which have taken shape in the middle school, enlarges and enriches the general courses already covered. In most States the course subjects are the same as in the previous stage, i.e., languages, science, mathematics, social studies (or history and geography), arts and crafts, physical education and citizenship training. Some States have not yet made science a compulsory subject of study. However, provision is made in several States for special courses in mathematics and science as optionals.

The higher secondary school provides (a) a core curriculum common to all pupils, consisting of languages, general science including mathematics, social studies and a craft, and (b) diversified courses of study in one of seven groups, namely humanities, sciences, technology, commerce, agriculture, fine arts and home science. The last year of the middle school is generally an exploratory stage when teachers are expected to discover the particular programme most suited to the pupil's abilities and interests. Crafts include hand spinning and weaving, woodwork, metal work, gardening, tailoring, sewing, needlework and embroidery, leather work, clay modelling and papermâché, workshop practice and printing technology. Each diversified course includes several interrelated subjects out of which the pupil elects his group according to his tastes and interests.

At present, at the end of the high or higher secondary course, pupils offer all their subjects for the public examinations conducted by the state boards. Cumulative records are being kept in more and more schools, and some States are trying to give more weight to internal examination.

Teaching staff. Teachers of high school classes are graduates, with an additional degree in education. The middle school is generally staffed with secondary grade trained teachers. The regional and national languages and art and craft subjects are taught by undergraduate teachers who hold diplomas or certificates as prescribed by the respective States. Higher secondary schools require teachers who hold a master's degree in addition to a diploma in teaching, and teachers with special technical qualifications to handle the practical streams. But the problem of teacher shortage, which was already acute, has now become further aggravated by the rapid expansion in secondary education, by the upgrading of high schools and by the introduction of diversified courses.

Teachers' pay varies from State to State, and from management to management. It may be said generally that scales of pay are not attractive enough to draw the best material to the profession, especially in respect of the technical courses. The problem of raising the pay and the status of teachers is being actively considered.

Teachers are recruited either through the Public Services Commission, the employment exchanges or departmental agencies.

Two classes of teacher training institution prepare teachers for secondary schools: (a) secondary teacher training institutions and (b) graduate teacher training institutions. The first is for those holding the High School or Higher Secondary School Certificate, and provides training, generally speaking, for 2 years. The second is for university graduates, a 1-year course which prepares them for the Bachelor of Education, Bachelor of Teaching or Licentiate in Teaching degrees. Eighteen universities also provide courses for the degrees of Master of Education, a 1- or 2-year course after the B.T. or B.Ed. degree, and Ph.D., which requires 2 to 3 years of study after the M.Ed. degree, and for research work.

Training institutions are of two types, basic and non-basic. There are training colleges exclusively for men and for women, while others are co-educational. Training colleges are generally recognized by the universities, which also award the diploma, except in one State where the training colleges are recognized, and the teaching diploma is awarded, by the State Department of Education.

In the basic training institutions the curriculum includes the philosophy and sociology of basic education, basic methods, theory and practice in crafts, psychology and administration. In the secondary training school, the curriculum covers, in addition to a similar pattern of subjects, a study of texts in the regional language. The practical part includes practice teaching, criticism lessons, observation and analysis of class periods, study of timetables, maintenance of records, case studies of selected children, preparation of aids, etc.

Teachers in secondary training schools are trained graduates. In addition, there are specialist teachers for language, crafts, physical training and art. Teachers in graduate training colleges should hold a master's degree, and a bachelor's diploma in education, and should preferably have had teaching experience in a secondary school. In addition to the principal, vice-principal and subject teachers, training colleges have posts of specialists for arts and crafts, physical education and psychology practicals.

The facilities available for training teachers for secondary schools are inadequate compared to the need, although progress is being made both towards more training institutions and more trained teachers. The percentage of trained teachers was 60 at the end of the first five-year plan as against 54 at the beginning. It is expected to rise to 68 at the end of the second plan in 1960–61.

In the field of teacher training, extension services have come to assume an increasing importance in the last 4 years. Initiated by the Government of India, these services are now being offered by 54 departments attached to selected training colleges. The departments give in-service training to teachers through seminars, workshops, conferences and study circles, and through audio-visual, library and guidance services. The training colleges also are benefited by this dynamic in-service training programme as they are made to come into living contact with schools and teachers and their actual problems.

Agricultural education

Manjri type school. This type of school is designed to combine practical training with theory. A farm of at least 150 acres is attached to each school. The students do all the work, including cooking, laundry and cleaning. The object is to make each school self-supporting on the products of the farm. The programme of studies, which covers two years, includes agriculture, animal husbandry, dairying, animal disease, horticulture, marketing and village industry. These schools are primarily organized to prepare students for village leadership. Those who have gone through a basic school and have had some secondary education but have not necessarily passed the Matriculation examination are admitted to the Manjri school. There are 50 Manjri type schools in Bombay State, and 150 such schools are expected to be established throughout India by the end of the second five-year plan.

Rural institutes. Ten rural institutes have been functioning since 1956–57 under the direction and supervision of the National Council of Rural Higher Education. The following courses are offered: (a) 3-year diploma course in rural education; (b) 3-year certificate in rural and civil engineering; (c) 2-year certificate course in agricultural sciences; (d) preparatory course for matriculates to prepare them for entry into the 3-year diploma course. The diploma course follows on after the Higher Secondary Examination, and the diploma is regarded as equivalent in standard to an ordinary degree at a university. Core subjects such as rural problems, the history of civilization, and regional languages are also taught in these institutes.

Technical education

This term includes vocational, technical and professional training. The Ministry of Labour and Employment is in charge of industrial training institutes, while the Ministry of Education is seeking to expand the provision of technical courses in multi-purpose schools. Private industry is also being urged to start technical training programmes.

On a recommendation made by the Central Advisory Board of Education in 1945, the Government of India constituted the All-India Council for Technical Education, the Council's principal duty being to advise the Central Government on the effective organization and planning of higher technical education in India, and to bring about proper co-ordination between the different institutions. The council appointed six All-India Boards of Technical Studies, one for each of the following: applied art, architecture and regional planning, engineering and metallurgy, chemical engineering and chemical technology, commerce and business administration, and textile technology. The boards have prepared diploma courses of a high standard, laying emphasis on the practical side. To attain co-ordinated development of technical education in each State and ensure proper standards of instruction, examinations, etc., in technical institutions, the council has drawn up a model scheme for the establishment of State Boards of Technical Education. Such boards have been established in several States.

There are two distinct levels of employment in both industry and government so far as the matriculates and non-matriculates are concerned: (a) the supervisor, foreman or overseer level; (b) the skilled level. The two are sharply demarcated, and each has its own educational requirements and training institutions. They cater to the needs of pupils who have completed the secondary school or, in some cases, the middle school.

Industrial training institutes or centres. There are now over 60 such centres in India, offering training courses in 28 technical trades and 18 vocational trades. These centres were under the direct control of the Ministry of Labour and Employment up to 1956. They have now been transferred to the State Governments where they are operated by the Labour Division, except in Bombay where they have been placed under the Director of Technical Education.

The period of training in the vocational trades is 12 months, and in the technical trades 2 years, of which the first 18 months are spent in the institute and the remaining 6 months in the factory or industrial plant. Technical trade schools admit only over high school age students (16 to 25), but vocational trade schools admit trainees of 14 years upwards, serving the same age group as the secondary school. Study up to the matriculation stage is required for certain technical trades only. A certificate of proficiency is awarded to each trainee upon the completion of the programme. The National Council for Training in Vocational Trades is attempting to establish uniform standards throughout all the States and a uniform certificate of proficiency.

Trainees are not charged fees, and about one-third of them receive a scholarship payment of Rs.25 per month to cover living costs. Selection is made by committees on the basis of the secondary school record and personal interview. In general, only matriculates are considered, preference being given to those with high school chemistry, physics and mathematics.

Some centres are located in conjunction with other institutions such as technical high schools and technical institutes. This permits the sharing of equipment and facilities.

In the technical trades, each trainee receives training in one major trade and one allied trade. Related instruction in a subject like arithmetic is given either along with the major trade training or in separate classes by a special instructor.

The shortage of competent instructional staff is a problem. As the scales of pay are far below those of industry, highly skilled tradesmen cannot be obtained for teaching.

Employment opportunities vary widely among the trades. Craftsmen and turners are more in demand than radio or motor mechanics. There is need for greater co-operation from industry.

Technical high schools. Separate technical high schools have been established in Bombay State for teaching the elements of mechanical and electrical engineering, and providing a certain amount of workshop practice to students of the high school classes. Along with these technical subjects, the students also study certain core subjects such as

regional languages, Hindi, social studies and science. In fact these schools correspond to the technical streams of the multi-purpose schools; they give a vocational bias but do not train the student for any specific vocation. Many of the students from these schools go on to a polytechnic or an engineering college.

Schools of industry. These provide specific craft training in weaving, carpentry, auto mechanics, turning and printing. In some cases they are combined with a technical high school and thus share shop facilities. The programme is of 2 years' duration. Students who have passed the middle school or its equivalent are admitted. The minimum age of admission is 15 years. Students who complete the training are considered semi-skilled. They can complete their training by apprenticing under a skilled worker.

Junior technical schools. This is a scheme proposed by the Ministry of Scientific Research and Cultural Affairs. These schools are to be established in industrial centres and wherever possible attached to a polytechnic so as to share common instructional facilities. The course is to be of 3 years' duration and is intended to provide vocational training opportunities in the technical trades to the secondary school-age boys of 14 to 17 years. The curriculum is to include a study of the humanities and languages, general science and mathematics, elementary mechanical engineering, engineering drawing and workshop training. Specific trade training is to be provided in turning, machining, fitting, smithing, tool-making, welding, sheet metal work, pattern making, moulding, electrical work, motor mechanics, and other technical trades. Completion of the 3-year programme is expected to lead either to further vocational training at an industrial training centre or to further technical education in a polytechnic.

Commercial education

Commercial high schools. These schools correspond to the commerce stream in the multi-purpose school. The course includes commerce and book-keeping, typewriting and shorthand, and prepares students for the SSC. (Secondary School Certificate) examination so that they will be eligible for entrance into a commerce or arts college.

Government Commercial Diploma and Commercial Certificate examinations. Bombay State has established a Government Commercial Diploma and Government Commercial Certificate. These qualify for positions in government service. To be eligible for the diploma examination a candidate should attend a recognized institution for 1 year if he is a matriculate and for 2 years if he is a non-matriculate. The examination covers English, commercial arithmetic, elements of book-keeping, commercial geography, methods of business, and one subject elected from shorthand, accountancy, typewriting, Indian administration, Indian banking, insurance, secretarial practice or salesmanship.

Commercial certificate examinations are taken by government servants and employees in commercial concerns. The certificates are of two kinds, one of regular and another of higher proficiency.

Out-of-class activities

Most secondary schools provide facilities for out-of-class activities; in some institutions these activities have become co-curricular and form an integral part of the regular educational programme.

Wherever playgrounds are available, sports and games are greatly encouraged. Attention is also being paid to the development of indigenous group games which are popular locally.

The scout and guide movements have taken deep root in India, and an association called the Bharat Scouts and Guides has many branches in all the States; a large number of schools have scout troops and scout camps are frequently organized. There is an Auxiliary Cadet Corps, open to pupils of the last two standards in all schools; the officers are drawn largely from the teaching profession so that teachers and students are brought into closer contact in the training camps.

There are many other extra-curricular or co-curricular activities which schools in all parts of India are developing to a greater or lesser degree: debates, dramatic performances, school magazines, excursions, gardening, social service projects, art projects and students' camps. In progressive institutions students are entrusted with the planning and organization of these activities. Quite a few schools have students' government in which the students not only have a share in the organization of extra-curricular programmes but are also sometimes consulted in internal management and administration.

TRENDS AND PROBLEMS

Since Independence, the expansion in secondary education in India has been remarkable, as is evident from the enormously increased number of schools and enrolment of pupils. It is expected that this tempo will be maintained during the third five-year plan.

Secondary education has a particularly vital role to play in the far-reaching social, cultural and economic revolution which is taking place in India. Not only does trade and industry need legions of properly qualified young men to staff the contemplated programmes of expansion, but an army of teachers is also needed for the primary schools under the scheme for providing free and compulsory education to all children in the age-group 6 to 11. This means not merely the opening of more secondary schools but also higher standards for the pupils, so that at the end of their course they may acquire a degree of academic proficiency comparable to that attained by school leavers in advanced countries. To this end the country has already accepted a programme of upgrading the high into higher secondary schools by the addition of one more year, and of improving the quality and content of instruction by introducing a reorganized and enriched curriculum, which means the provision of science in all the schools as well as a better qualified staff and fuller equipment for laboratory, library, and co-curricular activities.

One main defect of the existing system is that it is unilinear and that all the pupils, regardless of differing aptitudes and abilities, are pressed into one pattern. The

multi-purpose school as a corrective to this 'single-track' system, provides a diversity of educational programmes in the form of electives. At the same time pupils study a certain common core of subjects of general value so that they may grow up as intelligent citizens of a democracy. The technology, agriculture, commerce, fine arts and home science courses in these schools have been included in the curriculum both on account of their educational value and because they are to serve as terminal education for large numbers. The successful functioning of these schools is, at the moment, somewhat hampered by the shortage of trained and suitably qualified teachers in the practical streams, and the Government is engaged in finding a solution to this problem. Nevertheless, there is considerable enthusiasm for these schools, and about 10 per cent of the existing high schools have already been converted to this pattern.

Teacher shortages are also a feature of the upgraded higher secondary schools, where a large number of those who have a Master's degree are needed for teaching the core subjects as well as the electives, especially the sciences. Various programmes of in-service training for improving the qualifications of the existing teachers have been devised to meet the situation.

Under the reconstruction programme, special attention has been given to the teaching of science. In pursuance of a major project, 40 selected teachers were sent abroad for special training in methods of science teaching. A science club movement has also been started, and is expected to lead to an organized search for science talent.

Examination reform. The new objectives of the reorganized secondary education call for new evaluation and testing procedures, making examinations not a test of memory but a measure of the pupil's educational growth. An all-India programme of examination reform has been launched, with the help of specially trained personnel, so that in a period of 10 years the new techniques of internal and external assessment will have been adopted by the State Examining Boards.

Textbooks. The textbooks now in use in Indian schools do not come up to standard. This is partly due to the lack of co-ordination between educationists, authors and publishers. The Central Bureau of Textbook Research set up in 1954 helps the States in examining textbook content, and in other matters relating to printing and format. The bureau has developed objective criteria for the evaluation of textbooks.

Guidance and counselling. A Central Bureau of Educational and Vocational Guidance was set up in 1954, and Educational Guidance Bureaux have been established in many of the States. A full programme of educational counselling and guidance, at least in the multi-purpose schools, will be taken up for implementation soon.

The foregoing is a brief account of the existing trends and difficulties. In the underdeveloped countries which are anxious to join the vanguard of progressive nations, secondary education is apt to suffer because it is sandwiched between the large and urgent claims of compulsory primary education on the one hand and the pressing need to produce the leaders of government and industry through an expansion of university education on the other. And yet this middle storey is absolutely vital to the well-being and durability of the entire fabric of education. The secondary schools have to supply properly qualified teachers to run the multitudes of fast-springing elementary schools as well as to prepare well-grounded students for the universities. In India as in other countries the many problems posed by this difficult situation are challenging the resourcefulness and ingenuity of educationists.

STATISTICS

Population (mid-year 1958 estimate): [1]397,540,000.
Area: 1,267,094 square miles; 3,281,769 square kilometres.
Population density: 314 per square mile; 121 per square kilometre.

Summary of school statistics, 1953–56. In 1956/57, a total of 34.5 million persons were enrolled in some 330,000 educational institutions of all levels. This does not include 1,200,000 persons attending adult education schools or literacy centres. Between 1953 and 1956, total school enrolment increased by 23 per cent and the school-going population, representing 7.5 per cent of the total population in 1953, rose to 9 per cent in 1956.

Between 1953 and 1956, enrolment in general secondary schools increased by 25 per cent (female enrolment increased by 39 per cent), enrolment in vocational secondary schools increased by 40 per cent and in secondary teacher training colleges by 24 per cent (female enrolment increased by 11 per cent).

Enrolment in schools of primary education represented 75 per cent of the school-going population; enrolment in schools of general secondary education 21 per cent. Enrolment in pre-primary schools and in teacher training schools represented 0.3 per cent in each case. Enrolment in vocational schools was 0.5 per cent of the total and in general and technical institutions of higher education 2 per cent.

The proportion of girls among the pupils enrolled was as follows: pre-primary education, 42 per cent in 1956/57; 47 per cent in 1953/54; primary education, 31 per cent in 1956/57; 29 per cent in 1953/54; general secondary education, 21 per cent in 1956/57; 18 per cent in 1953/54; secondary teacher training, 27 per cent in 1956/57; 30 per cent in 1953/54.

Total teaching staff, at all levels of education, numbered some 1.1 million, of whom 18 per cent were women. (See Table 2.)

Enrolment trends in secondary education, 1930–56. Average total enrolment in 1955–56 was over five times that of 1930–34, although the ratio obtained by relating the average total enrolment to the estimated population 15–19 years old had not increased in the same proportion. The ratio was 5 for 1930–34 and 16 for 1955–56.

An important fact to note is the high increase in the proportion of girls among secondary school pupils—21 per cent in 1956 as against only 5 per cent in 1930. (See Table 4.)

Examination results in secondary education, 1953–56. Between 1953 and 1956, the number of certificates granted increased by 21 per cent (all students), the number granted to girls increasing by 36 per cent. Among those receiving certificates in 1956/57, 18 per cent were girls as against 16 per cent in 1953/54. (See Table 1.)

Educational finance, 1956/57. In the fiscal year beginning April 1956, 2,063 million rupees were spent on education. The larger part thereof was allocated by State Governments, amounting to 56 per cent of the total receipts. Capital expenditure represented 11 per cent of the total expenditure. (See Table 3.)

1. Teachers of higher teacher training are included with those of colleges for professional education (higher).

3. EDUCATIONAL EXPENDITURE, 1956/57 (in million rupees)[1]

A. RECEIPTS BY SOURCE

	Amount
Total receipts[2]	**2 063.1**
Central Government	141.8
State Governments	1 154.0
Local authorities	176.1
Tuition fees and other receipts from parents	401.0
Endowments, etc.	64.4
Other sources (not specified)	125.8

B. EXPENDITURE BY PURPOSE

	Amount	
Total expenditure[2]		**2 063.1**
Recurring expenditure		1 833.3
For administration or general control	41.2	
For instruction		
Salaries to teachers, etc.	1 126.0	
Other instructional expenditure	470.5	
Other recurring expenditure	195.6	
Capital expenditure		229.8

1. Official exchange rate: 1 rupee = 0.210 U.S. dollar.

2. Closed account.

C. RECURRING EXPENDITURE BY LEVEL AND TYPE OF EDUCATION

	Amount		Per cent	
Total recurring expenditure		**1 833.3**		**100.0**
Administration		[3]41.2		[3]2.2
Direction	9.7		0.5	
Inspection	31.5		1.7	
Instruction		1 596.5		87.1
Pre-primary education	2.9		0.2	
Primary education	584.8		31.9	
Secondary education	645.3		35.2	
General	587.3		32.0	
Vocational	37.8		2.1	
Teacher training	20.2		1.1	
Higher education	330.8		18.0	
Special education	25.9		1.4	
Adult education	6.8		0.4	
Other recurring expenditure		195.6		10.7
Scholarships	90.7		5.0	
Hostel charges	28.9		1.6	
Miscellaneous	76.0		4.1	

3. Includes 5,935,000 rupees (0.32 per cent) spent for central administration.

4. TRENDS IN SECONDARY EDUCATION, 1930–56

INDONESIA

THE EDUCATIONAL SYSTEM

Education in Indonesia is based on the Pantja-Sila, the philosophy of the Republican Constitution, and, whether provided by the Government or by private bodies, has as its purpose the achievement of the ideal expressed in the Indonesian motto: *Bhinneka Tunggal Ika*—Unity in Diversity.

Ethnic, linguistic, social, cultural and religious factors do not greatly affect the provision of schooling, although the Constitution lays down that every Indonesian is free to choose the type of education he wishes. Local languages may be used as the medium of instruction only up to the third grade of the primary schools in areas where they are spoken by a large part of the population, and only on request. Otherwise the national language, Bahasa Indonesia, is the compulsory medium of instruction from the very beginning except in private schools run by foreigners for their own children, and even these schools have to teach Bahasa Indonesia as a subject. Social discrimination has been done away with, so that all Indonesians have the same educational opportunities. Religious instruction is given only at the request of parents and if there is a teacher available for that subject.

Although the final goal is to educate Indonesian children within their own national culture, Western culture still affects education as a whole. English is taught as the first foreign language. The Indonesian child must become not only a good citizen of Indonesia but also a good citizen of the world, with a reasonable portion of tolerance.

The Central Government provides public secondary and university education; provincial governments are responsible for public primary education, under the supervision of the Central Government.

Private agencies, mainly religious, have primary as well as secondary schools, and universities.

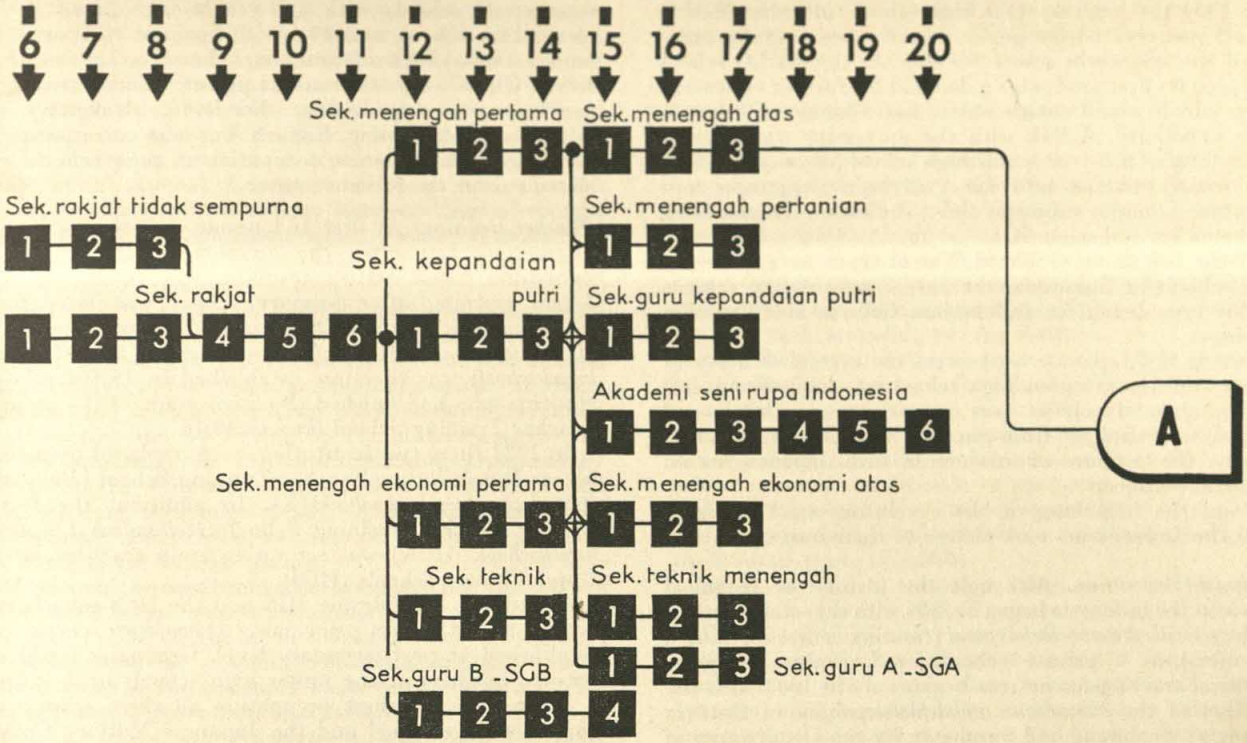
The structure of the school system is shown in the diagram on p. 663.

At the end of the sixth primary grade the pupils take their final examination, which is considered as an entrance examination for all types of secondary schools. As Indonesia has not yet enough high schools the Government is compelled to limit admission by giving priority to pupils obtaining the highest marks in this examination.

Not all secondary school diplomas entitle their holders to enrol at universities. In particular it is difficult for trade school graduates to continue their study at most of the government universities.

THE DEVELOPMENT OF SECONDARY EDUCATION

General education. The history of Western education in Indonesia begins with the arrival of the Portuguese and Spanish in the early part of the sixteenth century. Although the main purpose of the newcomers was trade, they brought with them the gospel and established religious schools.



The Dutch in their turn also set up church schools but these were only for the children of Christian natives, and for centuries were very few in number. Economic and social privileges given by the Dutch to Western educated Christians began to cause uneasiness among the Indonesian Muslim nobility, especially in Java. This group began efforts to obtain the right to send their children to the Dutch elementary schools, and a few Muslim boys of noble birth were admitted.

After the revolution of 1848 a new Constitution was adopted, which provided that the Governor-General of the Netherlands East Indies should sponsor schools for non-Christian children. One of the purposes of the schools established under this new act was to educate the personnel needed for 'indirect rule', which proved an excellent system for ensuring peaceful government of the subject people.

Secondary education began only in the last decades of the nineteenth century. An *ambachtschool*—a technical school of 2 or 3 classes, and a *kweekschool tot opleiding van inlandse onderwijzers*—a 4-year training school for native teachers, were established. Also a few Indonesian boys who had attended Dutch elementary schools were admitted to Dutch secondary schools. The good results achieved by these boys gave more impetus to the continued demand for admission to the Dutch 7-year elementary schools. The difference of curriculum between the 7-year Dutch school and the school which had been established for the Indonesians, the 5-year 'native school second class' (*inlandse school 2de klas*) was more and more felt as a discrimination. A 'native school first class' was established, with a 6-year course. The Dutch language was added to the curriculum and a Dutch teacher provided to teach this subject. But it became obvious that this type of school did not satisfy the demand.

The Russo-Japanese War brought about a revolution in the minds of Asian peoples, encouraging them to take every opportunity to fight for equality. In Indonesia, the Japanese had the same rights as Europeans and hence could send their children to Dutch schools. This led the Chinese in Indonesia to seek similar benefits. If their request were not met, they threatened to build schools for their children on the same pattern as schools in China; and to have allowed this would have meant giving permission to build a state within a state, as the Chinese already had their own leaders and their own regulations, although still within the framework of the Netherlands Indies Civil Administration Regulations.

In 1908 a solution to this problem was found in the establishment of the Dutch-Chinese school (*Hollandsch Chinesche school* or HCS), a 7-year course with Dutch as the medium of instruction. This was felt to be a discrimination by the Indonesians, so that in 1914 a Western

GLOSSARY

NOTE. In the accompanying diagram the word *sekolah* (school) is abbreviated to *sek.*

akademi seni rupa Indonesia: vocational training school of arts.
sekolah guru A (SGA): teacher training school at upper secondary level.
sekolah guru B (SGB): teacher training school at lower secondary level.
sekolah guru kepandaian putri: specialized teacher training school for teachers of home economics.
sekolah kepandaian putri: lower vocational secondary school of home economics.
sekolah menengah atas: upper general secondary school.
sekolah menengah ekonomi atas: vocational secondary school of commerce.
sekolah menengah ekonomi pertama: lower vocational secondary school of commerce.
sekolah menengah pertama: lower general secondary school.
sekolah menengah pertanian: vocational training school of agriculture.
sekolah rakjat: primary school.
sekolah rakjat tadak sempurna: rural primary school, at present incomplete but being progressively converted into full primary course.
sekolah teknik: lower vocational secondary school of technical studies.
sekolah teknik menengah: upper vocational secondary school of technical studies.

HIGHER EDUCATION

A. Universities and other institutions of higher education.

7-year Dutch-native school (*Hollandsch inlandsche school* or HIS) was founded exclusively for native children, with Dutch as the medium of instruction.

With the birth of these two types of school a keen demand arose for more advanced education. A 3-year junior high school, called an advanced primary school (*meer uitgebreid lager onderwijs* or MULO school) was established. Although this was also open to Dutch pupils who failed in their entrance examination to the secondary school proper (*hogere burgerschool*) it was in fact intended mainly for natives, Chinese and Eurasians.

The relatively high standard of living of former pupils of HIS and HCS schools, who obtained employment in government service and private undertakings, opened the eyes of the middle classes, the labourers, and the farmers. They also wished to have Western education for their children, who were usually sent to the 3-year village school (*sekolah desa*) and the 5-year second-class native school. For these children the Dutch, in 1922, instituted a 5-year 'link-school' (*schakesschool*) which admitted children who had passed through the *sekolah desa* and the third class of the *inlandsche school 2de klas.*

In 1937 the native junior high school (*inheemse* MULO school) was created for pupils who had successfully completed the *inlandsche school 2de klas*. As the MULO school produced its first graduates a demand for further education arose, which would enable native and Chinese children to enter university. A link with the university was realized in the form of a 3-year senior high school (*algemene middelbare school*) divided into an A division (languages and literature as major subjects) and a B division (emphasizing mathematics and science).

At the beginning of World War II there were 17 senior high schools in Indonesia, the only 2 government schools of this type being for Indonesian, Chinese and Eurasian children.

During the Japanese occupation the system of a 3-year junior and 3-year senior high school was maintained, but the number of schools was not increased. Dutch and English were dropped from the curriculum, and Indonesian became the medium of instruction with Japanese as an important subject.

From the beginning of the revolution on 17 August 1945 the Indonesians took charge of their own education.

Technical education. Although the history of technical education in Indonesia began in 1835 with the establishment of the so-called *ambachtsleergang* (training course for skilled labourers), as a private school for European students, technical training for natives began only in 1903 with the creation of the *inlandsche ambachtsleergangen* in Batavia (Jakarta), Semarang and Surabaya, by the Department of Instruction and Public Worship of the Netherland Indies Government. The courses for Europeans were taken over by the Government in 1912, and between 1914 and 1920 all these technical courses passed under the supervision of the Department of Agriculture, Industry and Commerce.

Since skilled labourers need better trained and educated supervisors, there was a need for schools with a broader curriculum. During the period 1902 to 1931, 5 technical schools were built in Batavia (Jakarta), Surabaya, Jogjakarta, Bandung and Semarang. These schools offered 3- or 4-year courses after primary school.

The Japanese Occupation Administration closed all these schools and courses in 1942 but reopened the 4-year technical schools in Jakarta, Jogjakarta and Surabaya in 1943. In 1944, 3-year senior technical schools, admitting pupils from the 4-year technical schools or the junior high schools, were set up in Bandung, Jogjakarta and Surabaya.

Home-making education. Under the influence of the philosophy of the famous Indonesian Princess Kartini and liberal thinking among the Dutch people in Indonesia, a trade school for girls (*huishoud school*) was set up in 1920; it was renamed the elementary industrial school (*lagere nijverheidschool*) in 1935, and is now called *sekolah kepandaian putri*.

In 1928, the Dutch established 4-year senior home-making schools for pupils having completed junior high school.

Business education. During the Dutch regime, the following institutions were founded: the 5-year Prins Hendrik School, 3 secondary commercial schools with a 2-year course based on the junior high school, 2 intermediate commercial schools with a 2-year course based on the elementary school, and 10 'small business' schools (*klein handel scholen*) with a 2-year course based on the *inlandsche school*. There were also various private courses leading to certificates in typewriting, shorthand, elementary and advanced book-keeping, English, business correspondence, etc. During the Japanese occupation all these schools were closed except the private courses.

Teacher training. At first Indonesian was the medium of instruction, but after the creation of the *Hollandsch inlandsche school* (HIS), teaching was in Dutch. This 4-year training after primary school was later found inadequate for teaching Dutch in the higher classes of the HIS, and a 3-year Higher Teacher Training School (*hoogere kweekschool*) was therefore established in 1919 for bright students who had finished the third grade of the ordinary Teacher Training School (*kweekschool*).

In 1927 these two institutions were replaced by a single 6-year Dutch-Native Teacher Training School (*Hollandsch inlandsche kweekschool*—HIK). In addition, the Dutch-Chinese Teacher Training School (*Hollandsch Chineesche kweekschool*—HCK) was set up to train teachers for the Dutch-Chinese schools (HCS).

In order to provide the HIS and the HCS schools with native and Chinese principals, a *hoofdacte cursus* was established at post-secondary level. Graduates could also become teachers at the junior high schools or inspectors.

During the Japanese occupation all these schools and courses were stopped and the Japanese Military Government created a 4-year teacher school with Indonesian as the medium of instruction and Japanese as an important subject.

Following the Proclamation of Independence, the Indonesian Government established several types of teacher training schools at secondary level for general and vocational education; these institutions are described below.

Legal basis

Education was basically governed from 1945 to 1950 by relevant articles in the 1945 Constitution. A provisional constitution was in force from 1950 till July 1959, when the earlier Constitution was re-established. The paragraphs concerning education in both Constitutions are almost the same, at least in spirit.

Education Act No. 4 of 1950, which gave legal expression to these general principles, defines the aims of secondary education (vocational as well as general) and makes it clear that the chief concern of secondary education is not to prepare the child for higher learning but to make him a useful member of the community. In a conference held in 1955 the senior secondary school principals expressed the view that the high school curriculum should no longer be dominated by preparation for college entrance but should be planned to meet the varied needs of all the young people of the community which it served.

Administration

Although the Government of the Republic of Indonesia is largely decentralized, secondary education still comes under the central authorities.

By Decree of 13 March 1957 the Department of Instruction of the Ministry (now Department) of Education was replaced by the two departments (now offices) for general and vocational education respectively. The Office of General Education has divisions for kindergartens, primary education, secondary education junior level, secondary education senior level, and teacher training; and the Office of Vocational Education divisions for technical education, business education, home-making education, other vocational education and teacher training for vocational education. The two offices have branches in the provincial capitals.

Each office is responsible for the planning and organization of the type of education with which it is concerned, and has its own research division for developing curricula, methodology and textbooks, and planning teacher training. The research division performs these tasks by creating pilot schools, and by setting up committees such as the Special Committee on Technical Education organized by decree of the Minister of Education, Instruction and Culture of 21 November 1958, No. 122045/5. Curricula, methodology and textbooks must be in conformity with the ideals of the Pantja-Sila.

All documents pass through the provincial representative's office to the central education authorities.

Other public authorities administrating schools at secondary level or providing vocational training courses include most of the principal Departments of State. (See under Types of secondary education.)

Subsidized and aided private schools follow the same procedure of administration as the government-run schools.

Supervision and inspection. Both general and vocational education are supervised and guided by the Central Government, each type of secondary education having its own central inspectorate. Junior secondary schools are inspected through head-inspectors and inspectors stationed in the provinces but belonging to the central education authority. Senior secondary school inspectors are posted to the central inspectorate headquarters in Jakarta. Special attention is given to two subjects, namely Bahasa Indonesia and English, each falling under a separate division in the offices of general and vocational education.

Inspectors are recruited from principals with a teachers' college or bachelor's degree.

Finance. Secondary education is on the whole financed by the Central Government. In some cases where a building is badly needed and the Central Government's budget is already exhausted, an appeal is made to the local community, particularly to parents, and this usually has good results. The Department of Education has drawn up standards for buildings and equipment, with special attention to lighting and sanitation. The Department provides the schools with equipment and furniture.

All secondary school teachers are paid by the Central Government from the budget of the Department of Education. Fees are charged according to the annual income of the parents, but the total fees collected by any one school are not enough to pay the salary of the most junior teacher.

School welfare services are still rare in Indonesia. Where they exist they are provided by parents' associations in close co-operation with the teaching personnel.

TYPES OF SECONDARY EDUCATION

All types of secondary education are open to pupils who have completed primary school and have passed the entrance examinations, the available places being filled by pupils with the highest marks.

General and vocational education are given full-time, even in places where there are not enough school buildings. If necessary, schools have morning, afternoon and evening sessions, each providing the full course.

Little help or direction is given to the pupil or parents in choosing the type of secondary education. However, as almost all parents want their children to have a university education, primary teachers, in appropriate cases, advise parents to send their children to vocational secondary schools in order to be able to meet the urgent need for skilled workers. Marks obtained in entrance examinations are an important consideration in admitting children to the various types of school.

Types of further education open to secondary school leavers include public and private universities and colleges.

The school year runs from the beginning of August to early July and is divided into 4 terms. At the end of the second term (December) there is a vacation of 7 days; however, if this overlaps or is too close to the 'Puasa vacation' of 30 days (taken in the Muslim lunar month of Puasa), the 7 days are transferred to another inter-term break. At the end of the school year there is a vacation which varies from 14 to 7 days, depending on the proximity of the Puasa holidays to one of the other term vacations.

Other holidays are the universal Muslim and Christian holy days. The only national holiday is on Proclamation of Independence Day (17 August).

The school week is from Monday to Saturday. The school day runs normally from 7.30 a.m. to 1 p.m., except on Fridays when school ends at 11 a.m.

General secondary schools. The word 'general' is used for schools not having as principal aim to prepare directly for a particular career.

There are two types of general secondary school: the *sekolah menengah umum tingkat pertama* (junior high school), which leads to *sekolah menengah umum tingkat atas* (senior high school), each school having a 3-year course.

In the third class of the SMP (junior high school) the course is split into an A stream and a B stream. As can be seen from the following time-table the former devotes more periods to language while the latter emphasizes mathematics and general sciences. But the differences are not so great that one may refer to a 'language' stream and a 'mathematics' stream.

The SMA (senior high school) has A, B and C streams, emphasizing respectively languages and literature, mathematics and science, and commercial subjects. Differences between these streams are shown in the following table.

At the end of the third year junior high school students take their final examination. Those who pass get a diploma and may request admission to the corresponding stream

TIME-TABLE FOR JUNIOR HIGH SCHOOLS (SMP)
(in periods of 45 minutes per week)

Subject	Year			
			3	
	1	2	Stream A	Stream B

Total	34	34	34 or 35	34

1. Alternative subjects.

of the senior school, i.e., the A or C stream for holders of the junior A stream diploma, and the B or C stream for pupils with the junior B diploma.

Students of the SMA who have successfully passed their examination in the 'less important subjects' (see table) at the end of the second year, may sit for their final examination at the end of the third year for the senior diploma.

Marks obtained in the various examination subjects are taken into consideration if the student applies for enrolment in the corresponding faculties of the universities and colleges. Successful A stream candidates are eligible to apply for admission to the faculty of letters, the academy of arts and the faculty of law; the B stream leads to the faculties of medicine, technology, veterinary science, agriculture, physics and pure sciences; the C stream to the faculties of law and economics.

Vocational and technical schools

As a developing country Indonesia needs increasingly large numbers of well-trained personnel for field and office work, and the funds allotted from the State Budget to the Ministry of Education are still inadequate to meet this

TIME-TABLE FOR SENIOR HIGH SCHOOLS (SMA)

need. Accordingly a wide range of courses and schools at the secondary level have been established by various other government departments to train staff. Some examples are given below. The usual minimum requirement for entry is a junior high school (SMP) diploma.

Department of Agriculture: specialized senior high schools for forestry, agriculture and veterinary science (3-year courses), and fresh water fishery (4 years).

Department of Defence: schools and courses for physical education instructors, radio operators, radio technicians, air traffic control personnel, army nurses and medical auxiliaries, etc.

Department of Shipping: navigation and radio operators' schools.

Department of Industry: courses in building materials, ceramics, starching (for the batik industry), and textiles. The Department also runs a senior school for technology (3-year course) and a school for chemical analysts (2 years).

Department of Health: schools for assistant radiologists, midwives, school dentists, nursery school teachers, physiotherapists, assistant pharmacists, etc.

Other departments providing vocational training include the Departments of Commerce, Justice, Social Affairs, Lands, Home Affairs, Communication, Police, Veterans Affairs, and Finance.

In all these schools and courses sponsored by the departments mentioned above, only vocational subjects are taught and training is restricted to the needs of the departments concerned. They are therefore quite different from the vocational and technical schools of the Department of Education, which train students within special fields according to the needs of the whole Indonesian community and with regard to the aptitudes and interests of the students themselves. To achieve this broader aim, the system of vocational education of the Department of Education is integrated with the whole educational system and comprises three main types of vocational secondary school—technical schools, domestic science schools, and commercial schools.

Technical schools. Sekolah keradjinan (SK). Schools for training in cottage industries offering 1- or 2-year courses, depending upon the type of handicraft or trade, for pupils who have completed primary school. The present scheme provides for training in the following subjects: woodcraft, masonry, blacksmithing, motor-repairing, carpentry, leatherwork, shoemaking, plumbing, sheet-metal work, dye-works, tailoring, weaving, ceramics, boat-building, etc. The establishment of these schools depends upon local conditions and needs. The curriculum consists of 80 per cent practical training and 20 per cent theoretical instruction.

Sekolah teknik (ST). Three-grade junior technical schools admitting pupils who have successfully passed an entrance examination and a test in drawing. There are courses in structural engineering, civil engineering, motor mechanics, electricity, mining, cabinet making, woodcraft, land surveying, weaving, ceramics, wireless, shipbuilding, printing, diesel motors. The accompanying time-table in a generalized one and may vary slightly from course to course. In the first semester of the first year, pupils are given various kinds of practical work so as to discover their talents; in the second semester they are placed in appropriate sections. The curriculum is 50 per cent practical work and 50 per cent theory.

Sekolah teknik menengah (STM). Three-grade senior technical schools admitting pupils who have successfully completed the junior high school (SMP) B stream with good marks in mathematics at the final examination. The aim is to produce technicians for management of certain state or private factories and workshops. The courses given are structural engineering, mechanical engineering, civil engineering, electricity, motor mechanics, mining, aviation, wireless, shipbuilding, marine engineering, chemistry, etc.

Physical education	2	2	2
Total	42	42	42

Kursus ahli teknik A (technicians' course A). A 1-year theoretical training course after the STM, principally concerned with research work.

Kursus ahli teknik B (technicians' course B). A 2-year course for graduates of *kursus ahli teknik A;* trains technicians as research assistants to university graduate engineers.

Kursus ahli teknik C (technicians' course C). A 2-year course after the B course, and at the same level as university engineering but with the main emphasis on practical training and research work.

Domestic science schools (*Sekolah kepandaian putri* or SKP). There are 2-year schools of this type, admitting girls who have failed the secondary school entrance examination. By training girls to become useful citizens, able to earn their own living, the 2-year school tries to prevent unemployment and child marriages. The curriculum consists of practical subjects: home-making, cookery, needlecraft, dressmaking, batik, drawing, weaving and general knowledge.

There are also 4-year schools, entrance to which requires success in the secondary school entrance examination. The first 2 years of training are devoted to preparatory courses in home-making and related subjects and in general

knowledge. In the last 2 years cookery, sewing, home-making, batik, drawing, weaving and needlecraft are taught as professional subjects.

Commercial schools. Kursus dagang tingkat pertama (KDP). Elementary 3-year courses providing opportunities for adults to follow courses in economics and business affairs.

Sekolah menengah ekonomi tingkat pertama (SMEP). Three-year junior commercial high schools, training pupils to start simple business enterprises of their own on a modern basis. Candidates for admission must have passed the entrance examination for the junior high school (SMP).

Sekolah menengah ekonomi tingkat atas (SMEA). Three-year senior commercial high schools, open to graduates of the SMP (both streams) and the SMEP. The object is to give students more advanced training in business affairs and some knowledge of foreign trade, and to enable leavers to set up in business for themselves. Bright students have the opportunity of entering the Faculty of Economics.

Teacher training schools

Sekolah guru B (SGB). This type of 4-year, post-primary teacher training school was set up in large numbers to train teachers for the introduction of compulsory primary education. Admission requirements are the same as for the SMP. The first three years are mainly devoted to general secondary education, professional training being undertaken in the fourth year. A small proportion of SGB students are given the opportunity of continuing their study at the SGA (see below) at the end of the third year. This type of school is disappearing and no new classes were begun after 1958.

Sekolah guru A (SGA). Teacher training school with a 3-year course in general and professional subjects for pupils who have completed junior high school.

Science teaching centre. The purpose of this centre is to improve science teaching and to give teachers already in service the opportunity of doing laboratory work.

Sekolah guru pendidikan teknik (SGPT). Teacher training school for technical education and a 3-year course after the technical schools (ST). Courses available include mechanical engineering, electrical engineering, machine woodwork, shipping, motor mechanics, diesel engineering, printing. Shop work is emphasized.

Kursus guru pendidikan teknik. A 1- or 2-year course for non-qualified technical teachers.

Sekolah guru kepandaian putri (SGKP). Trains teachers for home-making courses in domestic schools and needlework teachers for the SMP and other secondary schools. There are two courses—cookery and home-making, and needlecraft. Enrolment requires an SMP diploma or the completion of training at a domestic science school (SKP). At the end of the third year the students take their examination in practical work and at the end of the fourth year their examination in practical teaching.

Other specialized schools

The *Akademi Seni Rupa Indonesia* has a 6-year course after the SMP in plastic arts.

The *Konservatori Karawitan* offers 1- to 7-year courses in music and singing, Indonesian as well as Western.

The *Sekolah Kedjuruan Perhotelan* conducts a 2-year course in hotel management consisting of history of commodities, nutrition, elementary book-keeping, hotel organization, price policy, restaurant management, etc.

Teachers in secondary schools

In 1949 Dutch teachers made up 80 per cent of the staff in junior secondary schools and 90 per cent in the senior schools. The difficulties that arose when the Dutch teachers suddenly left Indonesia in the following year can be imagined. But, thanks to the industry and patriotism of the Indonesian people, particularly the teachers and education authorities, most of these problems were solved in record time. Qualified primary school teachers having had 6 years' training were moved to junior high schools and *hoofdacte* (post-secondary level certificate) holders to senior high schools. Primary schools had to be satisfied with less qualified or even unqualified teachers. As there were not enough *hoofdacte* graduates to fill the gap at the senior high schools, third-year government scholarship holders at the universities were appointed as teachers for 2 years and thereafter were allowed to continue their studies. An appeal was made to engineers and mechanics to teach part-time at the technical schools.

At present no more SGA graduates are being appointed to secondary schools. Junior secondary schools, general as well as vocational, are getting teachers from the *Pendidikan guru sekolah landjutan pertama* (RGSLP) teacher training school for junior secondary stage. Teachers for senior high school are trained in 2-year courses at university level.

Out-of-class activities

Out-of-class activities are still mainly limited to Boy Scouts, student associations (secular and religious), pen-friends, youth movements and youth columns in weekly papers. School sports and games are organized by the Department's Bureau for Physical Education, and every four years there is a National Sports Week.

TRENDS AND PROBLEMS

Indonesia has made remarkable progress in the field of secondary education since the Proclamation of Independence in 1945; delicate problems have been solved satisfactorily, but there are still many remaining. The educational authorities are at present preoccupied with problems such as how to provide within the shortest possible time buildings and equipment in a stringent monetary and budgetary situation—the Ministry of Education gets only 5 per cent of the total State Budget—in order to meet the ever increasing demand for secondary education.

Psychologically, the 'two-track system' (general and vocational) has some weaknesses in its relation to primary and junior secondary education. It is difficult to believe that primary school leavers are able to determine their specific aptitudes very accurately. To tackle this problem, comprehensive schools at junior secondary level have been suggested, where both general and elementary vocational subjects will be taught, making it easier for the teachers to advise students and their parents in choosing the direction of the future studies.

In view of the rapid development of the country's industrial, economic and business life it is felt that the balance between secondary general and vocational education has to be restored. Budget figures for secondary education indicate a distribution of 60 per cent for general education and 40 per cent for vocational. The idea now adopted of a distribution of 70 per cent for vocational and 30 per cent for general cannot be realized while the financial situation of the State is such that the diversion of more funds for vocational education could only be at the expense of general education.

Revision of vocational education curricula is in progress. Although 60 per cent of the time is devoted to professional subjects, graduates of vocational schools are still considered inadequately equipped to cope with their future tasks. The solution will be found in more training in practical work.

STATISTICS

Population (mid-year 1958 estimate): 86,900,000.
Area: 575,894 square miles; 1,491,562 square kilometres.
Population density: 151 per square mile; 58 per square kilometre.

Summary of school statistics, 1953–57. In 1957/58, total enrolment as shown in Table 1 exceeded 8 million pupils, or roughly one-tenth of the total population. This total may be distributed as follows: pre-primary education, 1 per cent; primary schools, 92 per cent; secondary schools, 3 per cent; vocational education, less than 2 per cent; teacher training schools, 2 per cent; higher education, 0.5 per cent. In public and aided private secondary schools, the proportion of girls was 29 per cent in general secondary education, 23 per cent in vocational education, 31 per cent in teacher training. The average number of pupils per teacher was 42 in primary schools, 29 in all the public and aided private secondary schools, and 12 in vocational schools (counting both full-time and part-time teachers). Between 1953 and 1957, enrolment in primary schools increased by 9 per cent, and in secondary education by 75 per cent.

Enrolment trends in secondary education, 1930–57. Between 1930 and 1939, general secondary school enrolment increased by 37 per cent, and vocational school enrolment by 28 per cent. Data are not available for the period 1940–49. Between 1950 and 1957, enrolment in general secondary schools increased two and a half times, and in vocational education and teacher training more than four times. However, total enrolment in all government schools for the period 1955–57 represented less than 5 per cent of the estimated population 15–19 years old. (See Table 2.)

Examination results in secondary education, 1953–57. The number of junior and senior high school diplomas more than doubled between 1953 and 1957. Girls received 27 per cent of the junior high school diplomas in 1957. The number of teaching certificates, type B, multiplied five times between 1953 and 1957, and the number of type A teaching certificates nearly tripled. Girls received 27 per cent of the type B certificates in 1957 and 30 per cent of the type A certificates. A total of 2,868 other types of teaching diplomas were awarded in 1957, as against only 311 in 1953. (See Table 3.)

Educational finance, 1956. From the total budget of the Ministry of Education, Instruction and Culture in 1956, an amount of 756,748,400 rupiahs was allocated for the financing of public education and subsidies to private education. This sum represented an average expenditure of about 9 rupiahs per inhabitant. Official exchange rate: 100 rupiahs = 8.80 U.S. dollars.

1. Not including 1,929 pupils, included in the total, whose sex is not known.
2. Not including 94 pupils, included in the total, whose sex is not known.
3. Decrease is due to change in school system since 1956/57.
4. Domestic science schools of 3 years were changed to domestic science schools of 2 years and domestic science schools of 4 years as of school year 1954/55.
5. Not including the number of graduates from 3 schools.
6. Schools for social workers and for legal officers.

IRAN

THE EDUCATIONAL SYSTEM

The Iranian educational system (excluding pre-primary schools which are not yet a universal feature) comprises the following levels:

1. Primary (age of entry 7; length of course, 6 years).
2. Secondary (age of entry between 12 and 13) subdivided into: (a) the first cycle, lasting 3 years and providing pupils with a general education; (b) the second cycle, comprising two types of education; academic, with the following branches: mathematics, Persian language and literature, natural science and domestic science (all of which prepare pupils for university), and vocational education.

The Iranian educational structure is centralized, the Minister of Education having been made responsible,

under Article 19 of the Supplementary Fundamental Laws, for the organization of existing schools and the foundation of new schools.

Educational administration in the towns comes under the directors of education appointed by the Minister. The budget of the Ministry of Education forms part of the national budget and the appropriations are apportioned among the various towns by the central government departments. However, the transfer of some of the powers of central government departments to local authorities is envisaged.

Private agencies may also establish schools, provided that they first obtain the permission of the Ministry of Education, and that the school curriculum is approved by the Higher Council for National Education.

The Organic National Education Act was promulgated in November 1911. Among its more important articles are the following:

Article 3. Primary education is compulsory for all Iranians.

Article 8. Schools may be either official or unofficial. Official schools are those founded by the State and unofficial schools those founded by private individuals or bodies.

Article 11. No person who has not passed the official examinations shall be admitted to official schools, no matter where he or she has studied previously.

Article 12. Ministry of Education inspectors may visit all public and private schools for the purpose of inspecting them and no school principal may hinder them in any way from so doing.

Article 14. The Ministry of Education shall forbid the teaching of anything that may be prejudicial to the moral and religious upbringing of pupils; books of which the use is forbidden by the Ministry may not be used in any school.

Article 18. The Ministry of Education shall arrange the various levels of education and decide on the examinations to be set at each level and on the certificates which candidates for the government service must possess.

Article 19. A rural primary school shall be established in every village and suburban district.

Article 20. One or more primary and secondary schools shall be established in every town, in accordance with the size of its population, the needs of its inhabitants and its financial resources.

Article 21. Universities and university colleges shall be set up in Teheran and the other large towns.

Article 26. School buildings and equipment shall be under the supervision of the Ministry of Education.

Article 27. Special regulations will be issued to govern the free education of needy pupils in secondary schools and universities.

Article 28. Corporal punishment is forbidden in all schools.

The Higher Council for National Education was set up under the law of 10 March 1922 for the purpose of promoting scientific and cultural activities. It consists of 10 full members, i.e., a Muslim jurist, the principals of a secondary school and a university, 1 secondary school and 1 university teacher, and 5 members appointed from among the country's leading scholars and scientists. In addition, the Council may have 10 honorary members serving in a purely advisory capacity.

Both full and honorary members are appointed by the Minister for 4 years, their appointments being subject to confirmation by the Shah. The Minister of Education and the Director-General of the Ministry are *ex officio* members of the Council. Council members receive no remuneration. The Council has a permanent secretariat.

The Teacher Training Act was passed on 9 March 1934. It states the aims and regulates the organization of secondary teacher training colleges and primary teacher training schools. Principals and teachers at the colleges must be at least 30 years of age and have a doctor's degree while for the primary training schools teachers must be at least 25 years of age and have a secondary teacher training school diploma and a bachelor's degree.

The Government is under an obligation to offer a teaching post to graduates of the training colleges and schools and to pay them a salary. New teachers serve a year's probation and the Ministry may dismiss them if it considers them unsuitable.

Both the primary and secondary teaching professions have a seniority and salary scale divided into 10 grades. In each of the grades 1 to 3, teachers must serve for at least two years and in each successive grade for at least three years before they are eligible for promotion to the next grade, which is awarded on the basis of ability and services rendered. Married teachers with children normally receive preferential treatment in this respect.

The salary for primary school teachers in the lowest grade is fixed by law annually. Secondary school teachers receive double the salary of primary school teachers. Secondary and primary school teachers appointed to a post at some distance from their normal place of residence may be granted an allowance equivalent to one-fifth of their salary as long as they continue working in the district in question.

The Minister may transfer secondary school teachers to administrative departments provided that the transfer is not contrary to the terms of their contract and that their grade is fixed in accordance with the salary they were drawing before the transfer.

All teachers may retire on reaching the age of 50, whatever their period of service.

In residential teacher training colleges and schools board and lodging, lighting, heating, laundry services, etc. are provided at state expense. Students are also awarded scholarships, the value of which is fixed annually. Those who leave the institution before completing their studies, or who commit any act incompatible with their terms of admission must refund not only the value of the scholarship awarded them but also the amount their education has cost the school each year. Those who do not remain in the teaching profession for at least 5 years after qualifying must refund a sum equivalent to one-fifth of the amount paid by the State for their studies plus one-fifth of the value of their scholarship, for each year of the 5-year period, not spent in Government service. Those dismissed by the State are exempted from this regulation.

Until such time as the teacher training colleges and schools have produced a sufficient number of qualified teachers for primary and secondary schools, the Minister is authorized by law to recruit on contract teachers that he is satisfied are competent, to pay competent persons

who are prepared to teach, or to assign civil servants already employed in other government departments to teaching posts.

The principals and teachers of teacher training colleges and schools are appointed by the Minister on the proposal of the Department of Education.

THE DEVELOPMENT OF SECONDARY EDUCATION

In the nineteenth century, the structure of Iranian education was as follows: the religious schools (*madrasseh*) provided both secondary and higher education; any child leaving a *maktab* (primary school) at the age of 11 or 12 could attend a *madrasseh* for further study in Persian and Arabic language and literature; this was the first and necessary preliminary to the study of Islamic theology and possibly of philosophy.

The establishment of the Teheran Polytechnic, in 1852, by the Grand Vizier, Amir-e-Kabir, marked the beginning of a change in the content of secondary and higher education under the pressure of national needs and increasingly closer contact with the West.

The revolution of 1906, which gave Iran a Constitution and a central government, also led to the reorganization of education. A few years later Parliament passed the first laws drafted by the Ministry of Education, establishing the new educational system with its three levels, primary, secondary and higher. Primary education was intended for children from 7 to 11 years of age in rural areas and from 7 to 13 in the towns. After passing through the 6 grades of primary school, town children could enter a secondary school, but secondary education was free only for the children of needy families. At that time, however, there were few secondary schools and it was not until after the first world war and the establishment of the Pahlevi dynasty that secondary education began to expand. In fact its development became one of the principal concerns of the Iranian Government, which needed qualified officials for its civil service.

With the establishment of the Teheran secondary teacher training college, the promulgation of the first law on study abroad (1928), the Teacher Training Act (1934) and the preparation of the first official curriculum for secondary schools (1934), this level of education took definite shape. The establishment of the university of Teheran in 1934 put the final touch to the reorientation of Iranian secondary education.

The scheme then adopted divided secondary education into two 3-year cycles. The first cycle was designed to provide a general academic education, specialization beginning in the second cycle. Reforms to this system were introduced as early as 1938. Since 1955, the second cycle has been divided into four branches, literature, mathematics, natural science and domestic science.

Technical education, which had been left in the background, if not completely neglected, until 1935/36, began to develop from then on with the establishment of a large number of trade schools, mostly in Teheran.

At the moment, because of the large number of persons with a secondary leaving certificate wishing to enter university, and because of the country's need for medium-grade technicians, technical secondary education is expanding rapidly and a great many students with a first-cycle secondary certificate find in the technical and vocational schools a means of continuing their studies.

Administration

Syllabuses and regulations governing the subjects taught in secondary education are drafted by the Ministry's Department of Secondary Education and the Research and Programme Department. For the technical and vocational side, these departments enlist the co-operation of the Technical Education Department.

The drafts are submitted for consideration to a standing commission, consisting of experienced secondary school teachers, teachers at the secondary teacher training college and the Ministry's technical advisers. They are then studied by the Minister, who transmits them to the Higher Council for Education for final approval.

Teaching methods and problems of secondary education are usually discussed at national conferences convened in the various towns of the country by the Research and Programme Department. Participants include the authorities responsible for secondary education in the provinces and the Ministry's technical advisers.

The compilation and publication of secondary school textbooks is left to private initiative. Every year, the authors or publishers submit the printed text of their books to the textbook committee of the Higher Council for Education. The committee reports to the Council, and if necessary, requests the authors to amend their texts. Every June, the Council's secretariat prepares a list of all textbooks approved by the Council and distributes it to the various regional departments of education. At the beginning of every school year, teachers choose books on their particular subjects from this approved list for recommending to their pupils.

Supervision and inspection. The Ministry transmits instructions to the Directors-General for Education in the towns and provinces on the application of the syllabuses and regulations approved by the Higher Council for Education. The Directors-General supervise the application of these measures by those responsible, namely, the principals of secondary schools, vocational schools and primary teacher training schools. The Ministry's instructions are also binding on any private secondary schools and vocational schools which receive a Ministry grant.

Inspectors of education are chosen from the principals and teachers of secondary schools who have a minimum of 10 years' teaching experience and have reached the age of 35. These official inspectors are the only persons or agencies entitled to intervene in secondary school affairs. Of recent years however, some parents who are members of the Parents' and Teachers' Association have been allowed to co-operate with the secondary school authorities.

Finance. Secondary schools may be classified as follows according to the manner in which they are financed: (a) public secondary schools, financed entirely by the Ministry of Education; (b) semi-public secondary schools,

also financed by the Ministry, but entitled to charge school fees to help pay for the completion of school buildings, or the equipment of laboratories or libraries; (c) private secondary schools, largely dependent on school fees for their funds. However, by decision of the Higher Council for Education, the Ministry may make grants to such schools and supply them with teachers wherever possible. In all towns except Teheran the grant is 60 rials per non-paying pupil in the first cycle and 70 rials per non-paying pupil in the second. In Teheran the corresponding amounts are 70 and 100 rials respectively.

School welfare services. A school health service to watch over the health of secondary school pupils exists in all towns.

TYPES OF SECONDARY EDUCATION

Secondary education begins at the age of 13. Those who obtain the first cycle certificate (after a 3-year course) may continue their education:

1. In one of the four branches of the second 3-year cycle, literature, natural science, mathematics and domestic science, after which they may sit a competitive entrance examination for a university or other institution of higher education (the military academy, the Abadan advanced technical college, the senior police college, etc.), *or*
2. In a vocational school (*honarestan*). Students who qualify after completing the 3-year course are awarded a diploma of technical or vocational efficiency. With this diploma they may continue their studies at an advanced technical school such as the Technological Institute.

Iran now has a scholastic guidance programme; the plan is to collect information on pupils and, by way of experiment, to keep a school career file on each of them. Some steps have also been taken to devise standard tests in the Persian language and mathematics, and to compile intelligence tests. These preliminary activities will make it possible to set up a systematic and scientific system of educational and vocational guidance.

The secondary school year begins on 15 September and ends on 15 June. Schools in hot districts however, are authorized to begin their examinations on 5 May, their year then ending on 20 May.

The school year is divided into three terms. The main holidays are the last 10 days of the first term (from 11 to 21 December), 13 days at the time of the Iranian new year (from 21 March to 24 April) and 3 months in summer. There are 6 school days a week and classes are held from 8.30 to 11.30 a.m. and 2.30 to 4.30 p.m.

General secondary schools

The curriculum for the first secondary school cycle (see table) was established with an eye to the needs of pupils who cannot, or do not wish to, continue their studies, as well as to those of pupils wishing to carry on to university. Possession of a primary school certificate is essential for entrance to a secondary school.

TIME-TABLE FOR FIRST CYCLE OF GENERAL SECONDARY SCHOOLS

Subject	Year		
	First	Second	Third
Religious instruction	2	2	2
Persian	4	4	3
Arabic	2	2	2
Mathematics	4	4	4
Physics and chemistry	2	2	4
Natural history and hygiene	2	2	2
History and geography	2	2	2

Physical culture	2	2	2	2	2	2	2	2	2	1	1	1

The various types of study open to persons with a secondary leaving certificate are shown in the diagram on page 677.

Secondary school teachers are trained at the Teheran secondary teacher training college or at the one quite recently opened in Tabriz.

Evening secondary schools. Anyone prevented by his daily occupation or by age from attending a day school may

enrol at an evening secondary school, provided that he or she has a primary school certificate.

The curricula at these schools are identical with those of the other general secondary schools in Iran. Towards the end of every school year, the Ministry of Education decides on the centres at which candidates from these schools may take their end-of-year examinations under the supervision of the regional education departments. The evening secondary schools are usually private schools but are under Ministry supervision.

The evening secondary schools generally give 18 hours of teaching a week. Pupils with the leaving certificate issued by these schools—like those from the day schools—may sit the competitive entrance examinations for a university or other institution of higher education.

Vocational and technical schools

Trade schools. In principle, vocational education begins in the second cycle of secondary school. However, in addition to the vocational branches of this second cycle, there are vocational schools of an educational standard equivalent to that of the first cycle of general secondary education. These are intended to train skilled tradesmen and have from 1 to 3 grades. Persons who have completed their primary schooling may enrol at one of these schools.

A specimen time-table is given below.

The schools have various sections: masonry, building, metalwork, tinwork, smelting, automobile engineering, carpentry and cabinet making. The leaving certificate of such schools does not entitle the holder to continue his studies at a secondary school, a teacher training school or a vocational secondary school.

There are now 15 schools of this type in Iran, attended by 1,505 pupils.

TIME-TABLE FOR TRADE SCHOOLS
(in hours per week)

Subject	Year		
	First	Second	Third
Practical arithmetic	3	2	2
Technical drawing	4	4	4
Technical subjects	4	3	2
Mathematics (algebra and geometry)	—	1	5

Religious instruction	1	1	1
Foreign languages	2	2	4
History, geography, civics, social legislation	—	2	1
Physics and chemistry	—	1	3
Physical culture	—	—	2

Agricultural secondary schools. These schools are of two types, those of the first and those of the second cycle. By a recent decision of the Ministry of Education, the first-cycle agricultural schools are being converted into general secondary schools.

The table below shows the time allotted to the various subjects taught in agricultural secondary schools of the first cycle as of January 1957.

Agricultural secondary schools of the second cycle have been in existence only since 1958/59. The following subjects are taught: horticulture, animal husbandry, rural administration, agricultural machinery and equipment, cottage industries and the training of agricultural advisers and of rural administrators.

Pupils must obtain the full secondary school-leaving certificate if they wish to go on to more advanced studies.

Industrial secondary schools. The industrial schools correspond to the second cycle of secondary education. They

are open to secondary school pupils who have their first-cycle certificate. The industrial schools train qualified technical staff for the various branches of industry. They include industrial secondary schools for boys, with courses in automobile engineering, metalwork, dyeing, spinning, carpentry, electricity, building; and vocational secondary schools for girls with the following branches: dressmaking, cooking, hairdressing, secretarial work and decoration. In these schools general subjects account for half the syllabus. Pupils begin to specialize only in their second year.

Persons with diplomas from these schools obtain employment as foremen in private undertakings. If they wish to continue their studies at institutions of higher education, they must first obtain the full secondary leaving certificate (mathematics side). Teachers for industrial secondary schools are trained at the Technological Institute.

Teacher training schools

There are three types of schools for training teachers:

Primary teacher training schools (boys and girls). These turn out teachers for primary schools. The course lasts 2 years. To enter the schools, candidates must be Iranian nationals between the ages of 16 and 22, hold a first-cycle secondary school certificate and have the necessary physical and character qualifications. They must also be successful in a competitive entrance examination (which includes papers on arithmetic, geometry and Persian composition) and in an interview held in conjunction with it.

In some of the primary teacher training schools the students live in, in the others they hold scholarships and live out.

The following subjects are in the school curriculum: Persian and Arabic, mathematics, physics, chemistry, natural science and hygiene, foreign languages, social science, history and geography, psychology and education, religious and moral instruction, drawing and manual training. There are 32 hours of instruction per week. Teachers at these schools, like secondary school teachers, are appointed from among the graduates of the secondary teacher training colleges who have a bachelor's degree.

Agricultural teacher training schools. These train teachers for rural primary schools. The course lasts 2 years. The conditions of entry are similar to those for the schools just described, with the additional requirement that candidates must have experience of rural life and some knowledge of farming. Students live in at all agricultural teacher training schools.

Apart from the larger amount of time devoted to studying agriculture in class and in the field and to workshop training the syllabus differs little from that of the primary teacher training schools. There are 43 hours of instruction per week. Teachers of general subjects are appointed from graduates of secondary teacher training colleges who have a bachelor's degree. Teachers of specialized subjects (agriculture) are recruited among qualified agricultural engineers.

Teacher training schools for tribal areas. To enter these schools, students must be members of a tribe, have reached the age of 17, hold a primary school certificate and be successful in the competitive entrance examination. All students live in. On completing their studies, they must teach for at least four years in a primary school in areas with a tribal population.

TIME-TABLE FOR TRIBAL TEACHER TRAINING SCHOOLS
(in hours per week)

Administration	—	—	4

The Teacher Training Department of the Ministry of Education is responsible for drawing up, and supervising the application of, the syllabuses for all teacher-training schools (primary, agricultural and tribal).

Schools of music and art

These are vocational schools coming under the Directorate-General of Fine Arts.

Schools of music. To enter these schools, candidates must be not more than 17 years of age, already have their primary school certificate, show a special bent for music and pass an examination in elementary musical theory and practice. Pupils who obtain their first-cycle certificate at one of these schools may go on to the second cycle, which is also open to outside candidates who have their first-cycle secondary school certificate and pass the music examination required for entry into the first-cycle of the school. Pupils who successfully complete the course are awarded the second-cycle (leaving) certificate.

The Ispahan School of Fine Arts. This school serves a twofold purpose: to provide suitable training for gifted artists and to develop national arts.

To enter this school, candidates must be not more than 16 years of age, hold a primary school certificate and show evidence of artistic gifts. They must also produce a medical certificate showing that they are in good health. The leaving certificate of this school is equivalent to the secondary leaving certificate.

TRENDS AND PROBLEMS

Revision of secondary school curricula. The revision of the first and second-cycle curricula has been one of the major concerns of the Ministry of Education. The revision of the first-cycle curriculum in 1955 was intended to achieve the following objects: to initiate pupils into the study of civics and the principles of community life and to give them some idea of the activities of international organizations; to improve the co-ordination of the various subjects on the curriculum; to teach pupils to study at first hand the environment in which they live; to introduce manual training and social activities into secondary school syllabuses; to make use of modern audio-visual aids in teaching.

For some time now the Ministry's educational advisers have been planning new syllabuses for the first cycle and the various branches of the second cycle of secondary education. In so doing, they are guided by the following policy considerations: the division of subjects into compulsory and optional ones should be done in such a way as to cater for the different interests and aptitudes of individual pupils; the new syllabuses must be flexible enough to make it easy for pupils qualifying in one branch to continue their studies in another; the various subjects taught in each branch must form a coherent programme of study; introductory courses in the trades or vocations should be included as alternatives to pre-university courses; pupils should be encouraged to develop their powers of observation, capacity for experiment and research, and ability to grasp the various problems, rather than mere memorization.

Organization of an educational and vocational guidance programme. For the last 2 years, the Ministry of Education has been preparing the ground for the introduction of an educational and vocational guidance programme for secondary schools. This preparatory work has taken various forms: holding training courses for future guidance officers; devising and trying out progress tests in Persian and arithmetic; collecting and indexing descriptive information on the various trades and occupations in Iran (activities, conditions, etc.); devising intelligence tests; building up 'school career' files for pupils in the first cycle of secondary education; issuing pamphlets and arranging talks in order to familiarize senior secondary school teachers with the principles and methods of educational and vocational guidance.

Reform of the examination system. In accordance with the new regulations for secondary schools, framed in the light of the discussions and recommendations of the Teachers' Congress held in the summer of 1958, the curriculum has been reorganized so as to make it easier to assess, by means of examinations, the progress made by pupils and the fruits of their efforts, and, at the same time, to guide them towards the most suitable line of study or occupation. The subjects on the curriculum have been divided into 9 integrated subject groups, viz. Persian and Arabic; foreign languages; social studies (history, geography and civics); mathematics (arithmetic, algebra, geometry and technical drawing); experimental subjects (physics, chemistry, natural science and hygiene); art subjects (calligraphy and painting); religious and moral instruction; domestic science (for girls) and manual training (for boys); physical culture.

This classification makes it possible to keep a better balance between the various subjects taught in each branch. Another advantage is that if a pupil is weak in one of the subjects of a particular group and good in the others, it gives him the opportunity of rapidly overcoming his weakness and moving to a higher grade.

Under the new regulations, pupils who have their first-cycle secondary school certificate must have obtained a prescribed average mark in the mathematics group if they wish to take the mathematics branch of the second cycle, and the same average mark in the experimental subjects group if they choose natural science.

Similarly those wishing to take the literature course in the second cycle must have obtained the average in the social study group and those wishing to take the home economics course must have obtained the average in the corresponding subject group in the first cycle.

Diversification of branches of study in the first and second cycles. In view of the growing number of secondary school children in Iran and of the country's need for specialists in the various fields of industry, agriculture, commerce, etc., the Ministry has been paying particular attention in recent years to the establishment of technological, agricultural and vocational branches side by side with the other branches in the second cycle of secondary school.

Training of teachers. Various steps have been taken to remedy the shortage of primary and secondary school teachers graduating from the training schools and colleges. These include the revision of the curriculum in the primary teacher training schools (more hours devoted to educational theory and practice in teaching), the organization of courses to improve the qualifications of non-graduate teachers at present employed in secondary schools, the introduction of evening classes at secondary teacher training colleges, the publication of a series of books and pamphlets intended for practising teachers, etc.

[*Text prepared by Dr. M. Machayekhi, Ministry of Education, Teheran, in July 1959.*]

STATISTICS

Population (mid-year 1958 estimate): 19,723,000.
Area: 629,345 square miles; 1,630,000 square kilometres.
Population density: 31 per square mile; 12 per square kilometre.

Summary of school statistics, 1953–57. Total enrolment in educational institutions at all levels was 1,245,855 students in 1957/58, representing about 6.5 per cent of the total population. There were in addition about 227,000 adults attending literacy and evening school courses. Of the total school enrolment 83 per cent were pupils in pre-primary and primary schools, 15 per cent in general secondary schools, 0.6 per cent in technical schools, less than 0.5 per cent in all teacher training institutions and just under 1 per cent in universities. Girls made up about 31 per cent of the enrolment at primary schools in 1957/58 compared with 28 per cent in 1953/54 and in general secondary schools 26 per cent against 24 per cent in 1953/54. In teacher training schools girls represented 11 per cent of enrolment and in teacher training colleges 18 per cent. At universities, the proportion of girls rose from 8 per cent in 1953/54 to nearly 13 per cent in 1957/58. The teaching staff in primary schools numbered 37,346 in 1957/58 of whom 33 per cent were women. The number of primary school teachers increased by 38 per cent over the period under review and the average primary pupil-teacher ratio was 27 in 1957/58 compared with 28 in 1953/54.

In public general secondary schools the staff increased by 63 per cent between 1953/54 and 1957/58. Enrolment increased strongly at all levels of education over this period and in particular by 37 per cent in primary schools, 55 per cent in general secondary, and 28 per cent in universities. (See Table 2.)

Enrolment trends in secondary education, 1950–57. Enrolment in general secondary schools more than trebled over this 8-year period and the proportion of girls to total enrolment increased from 21 per cent in 1951 to 26 per cent in 1957. The ratio of general secondary enrolment to the age group 15 to 19 years old increased from 5 to 9 over the period 1950–57. (See Table 1.)

Educational finance, 1958/59. Excluding higher and special education, expenditure in 1958/59 (fiscal year beginning 21 March) was 5,354 million rials, representing approximately 271 rials per inhabitant. Most of this sum was derived from the Central Government, school fees and examination fees contributing less than 0.4 per cent of the total spent. Capital expenditure amounted to 166 million rials or about 3 per cent of the total. The breakdown of administrative and instructional expenditures is given in Table 3C.

4. The distribution includes recurring expenditure of 5,188,457,000 rials and capital expenditure of 165,522,000 rials.
5. Includes special education.

IRAQ

THE EDUCATIONAL SYSTEM

The aims of education in Iraq are to equip the pupils with a fund of basic general culture, help them to discover and develop their capabilities and aptitudes, and bring them up so that they become good citizens, sound in body, mind and character.

The national school system comprises the following levels and types of education:

Primary education. A 6-year course, the curriculum being sufficiently flexible to allow for adaptation to the differing needs of urban and rural communities. There is provision for the teaching of English to be begun in the fifth class. At the end of the course a public examination is held the results of which determine admission to the intermediate stage of secondary schooling.

General secondary education. This is organized in two cycles: 3-year intermediate followed by 2-year preparatory. Studies at the intermediate level include Arabic, English, social sciences, mathematics, natural sciences, hygiene, religion and art. In the preparatory (upper secondary) cycle, there is differentiation into three sections or streams: literary, emphasizing Arabic, English and social sciences; scientific, in which mathematics and science are given more

prominence; and commercial. A public examination is taken at the end of the preparatory course.

Vocational and technical education. A number of institutions provide 5-year courses based on completion of primary schooling. There are also schools which offer 2- or 3-year courses following the intermediate cycle of general education.

Higher education. This is provided in the different colleges of the University of Baghdad, and other specialized institutions.

Administration

General responsibility for the educational system is vested in the Minister of Education. The Minister and senior members of his staff form the Education Council, a body which lays down educational policy, reviews and approves the budget, and approves curricula and textbooks. Under regulations issued in 1958 the Ministry was reorganized in nine departments as follows: Antiquities, Academy of Science, Research and Guidance (with sections for educational statistics, publications and libraries), Physical Education and Welfare, General Education (including a separate section for secondary education), Administration, Inspectorate-General (including inspectors of secondary school subjects), Vocational (sections for commercial, agricultural and industrial education, teacher training and fine and applied arts), Technical Affairs (sections for scholarships, curricula, textbooks and visual aids, examinations and certificates, cultural relations). Each department is headed by a director who is responsible to the Minister for the implementation of policy in his own sector.

Iraq is divided into 14 provinces, each of which has a director of education. Until recently the administration of education was fairly centralized but measures have now been taken to delegate more responsibility to the provincial authorities, particularly for primary education.

Public education is financed from the national budget (60 per cent from the central government budget and 40 per cent from the Development Board—now the Ministry of Planning). The following table shows that not only has there been a steady increase, in recent years, of the amount spent on education but that the annual education budget has, except in 1951 and 1952, represented an increasing proportion of the national budget.

Year	Education budget Dinars	National budget Dinars	Percentage
1950/51	3 599 231	25 717 229	13.8
1951/52	4 092 917	30 820 227	13.2
1952/53	4 946 731	44 480 289	11.1
1953/54	6 786 927	50 157 017	13.5
1954/55	8 517 768	53 798 028	15.8
1955/56	10 044 757	55 200 908	18.2
1956/57	12 457 077	66 032 455	18.9
1957/58	14 327 604	70 693 430	20.3

The average annual rate of increase in the education budget over the 7 years thus amounted to 22 per cent.

School teachers are civil servants, and their salaries, together with those of other public education officials, are included in the budget of the Ministry of Education. There is a basic salary scale, supplemented by family and cost-of-living allowances and special allowances for service in outlying districts.

STATISTICS

Population (mid-year 1958 estimate): 6,700,000.
Area: 171,600 square miles; 444,442 square kilometres.
Population density: 39 per square mile; 15 per square kilometre.

Summary of school statistics, 1953–57. In 1957/58 enrolment at all levels of education (not including adult education) was 525,000, or about 8 per cent of the total population. Of these pupils, 83 per cent were in primary schools, 15 per cent in secondary general, vocational and teacher training schools, and 1 per cent in institutions of higher education. The proportion of girls was about 25 per cent in primary schools and 20 per cent in secondary schools; these proportions have not changed since 1953. Of the teaching staff in primary and secondary schools, numbering 16,500, 31 per cent were women. The pupil-teacher ratio was 34 for primary schools and 20 for general secondary schools, as compared with 29 and 17 respectively in 1953. The increase in total enrolment between 1953 and 1957 amounted to about 60 per cent, largely through an expansion of primary and intermediate education. (See Table 2.)

Enrolment trends in secondary education, 1930–57. Between 1930 and 1944, enrolment in public secondary schools increased more than five times. Furthermore, total enrolment in public and private secondary schools increased three and a half times between 1945 and 1957. In respect of general secondary education, it may be noted that the proportion of girls has tended to increase but very slightly. Enrolment in vocational schools, although showing steady increase over the whole period, still compares unfavourably in numbers with the enrolment in general secondary schools. Enrolment in teacher training schools showed little or no increase except in the last two years under review. Finally,

it may be seen from Table 1 that the average total enrolment increased rapidly during the entire period, after taking into consideration the increase of population.

Examination results in secondary education, 1953–57. In terms of the number of certificates granted there was a steady and remarkable increase between 1954 and 1957 for certificates of intermediate and secondary schools. The increase was much less in the case of certificates from vocational schools. As to teaching certificates, the number diminished between 1953 and 1955, but there was a sharp rise after that, parallel to the rise in enrolment of the teaching training schools. (See Table 3.)

Educational finance, 1959/60. The budget of the Ministry of Education for 1959/60 amounted to 24,583,250 dinars, representing an average expenditure of about 3.7 dinars per inhabitant, as compared with 1.4 dinars per inhabitant in 1954 (See *World Survey of Education:* II—*Primary Education*). Official exchange rate: 1 dinar = 2.80 U.S. dollars.

IRELAND

THE EDUCATIONAL SYSTEM

The fundamental principles underlying the educational system of Ireland are set out in the Constitution as follows:

Article 42.

1. The State acknowledges that the primary and natural educator of the child is the family and guarantees to respect the inalienable right and duty of parents to provide according to their means for the religious and moral, intellectual, physical and social education of their children.
2. Parents shall be free to provide this education in their homes or in private schools, or in schools recognized or established by the State.

3(1). The State shall not oblige parents, in violation of their conscience and lawful preference, to send their children to schools established by the State or to any particular type of school designated by the State.

(2). The State shall, however, as guardian of the common good, require in view of actual conditions that the children receive a certain minimum education, moral, intellectual and social.

4. The State shall provide for free primary education and shall endeavour to supplement and give reasonable aid to private and co-operative educational initiative, and when the public good requires it, provide other educational facilities or institutions with due regard, however, for the rights of parents, especially in the matter of religious and moral formation.
5. In exceptional cases, when the parents for physical or moral reasons fail in their duty towards their child, the State, as guardian of the common good, by appropriate means shall endeavour to supply the place of the parents but always with due regard for the natural and imprescriptible rights of the child.

Article 44.

2(4). Legislation providing state aid for schools shall not discriminate between schools under the management of different religious denominations nor be such as to affect prejudicially the right of any child to attend a school receiving public money without attending religious instruction at that school.

(5). Every religious denomination shall have the right to manage its own affairs, own, acquire and administer property, movable and immovable, and maintain institutions for religious and charitable purposes.

(6). The property of any religious denomination or any educational institution shall not be diverted save for necessary works of public utility and on payment of compensation.

Together with the foregoing constitutional provisions, the following Acts form the main statutory basis of the educational system:

The Intermediate Education Acts, 1878 to 1924.

The Ministers and Secretaries Act, 1924, under which the Department of Education was established and its functions defined.

The School Attendance Act, 1926, which provides, *inter alia*, for compulsory full-time attendance at a national (primary) school or other suitable school by every child of 6–14 years of age who is not validly excused on certain defined grounds.

The Vocational Education Acts, 1930 to 1953.

The Children Acts, 1908 to 1957—providing for reformatory and industrial school organization.

The administration of public education in so far as the State is concerned is vested in the Department of Education under the Minister for Education, who is a member of the Government and responsible to Parliament in relation to the work of his Department. The Department has, under its survey in varying degree, the education provided in primary and secondary schools and in reformatory and industrial schools as well as the preparation or training of teachers for service in various types of school. Agricultural schools come within the administrative sphere of the Department of Agriculture. The universities and university colleges are chartered bodies independent of state control but in receipt of state aid by way of grants voted annually by parliament through the Minister for Education. An Institute for Advanced Studies was set up in 1940.

A Council of Education, established in 1950, advises the Minister for Education, in so far as pertains to the powers, duties and functions of the State, upon such matters relating to educational theory and practice as they think fit and upon any educational question referred to them by him. The members of the council, who are appointed by the Minister, belong to different religious, educational, cultural and other bodies and organizations.

The structure of the school system is shown in the diagram on page 689.

A system of National Education was established in 1831. In schools recognized under this system, still known as 'national schools', provision is made for free primary education. Pupils may be enrolled at the age of 4 years and may be retained on rolls until they reach the age of 18 years. The normal course of primary education in national schools extends for 8 years, including 2 years in classes for infants; post-primary courses are also provided in some schools. National schools are under the control of local managers who are usually clergymen and who have the power of appointment of teachers, subject to the approval of the Department of Education. The managers are charged with the direct government of the schools in accordance with the Department's rules and regulations for national schools. The remuneration of national school teachers is paid in full by the Department, which also makes grants towards the cost of building, reconstructing, heating and cleaning of the schools.

Secondary education is given mainly in two types of school, namely those of the grammar school type, which will be referred to throughout this article as secondary (grammar) schools, and those of the technical school type, which will be referred to as secondary (vocational) schools.

Secondary (grammar) schools are all private institutions, owned and maintained by the churches, religious orders, boards of governors or others. They receive state aid, however, in the form of capitation and other grants.

Secondary (vocational) schools are administered by local Vocational Education Committees under powers derived from the Vocational Education Act 1930 and subsequent amending Acts.

Reformatory and industrial schools are conducted by voluntary managers who own the schools and are responsible for the upkeep of the buildings, the appointment of the staff, the expenditure of the funds and all details of the school management. They receive grants from the Department of Education and also from the local authorities. Reformatory schools exist, generally speaking, for the detention of youthful offenders over 12 years and under 16 years who may be detained to a date not later than their nineteenth birthday. Industrial schools are for children up to the age of 16 years who have been found wandering, begging, etc., or who have been convicted by the courts of certain offences. Provision is made for the education and training as well as the maintenance of children committed to reformatory and industrial schools. In many cases they attend schools outside the institution in which they reside.

THE DEVELOPMENT OF SECONDARY EDUCATION

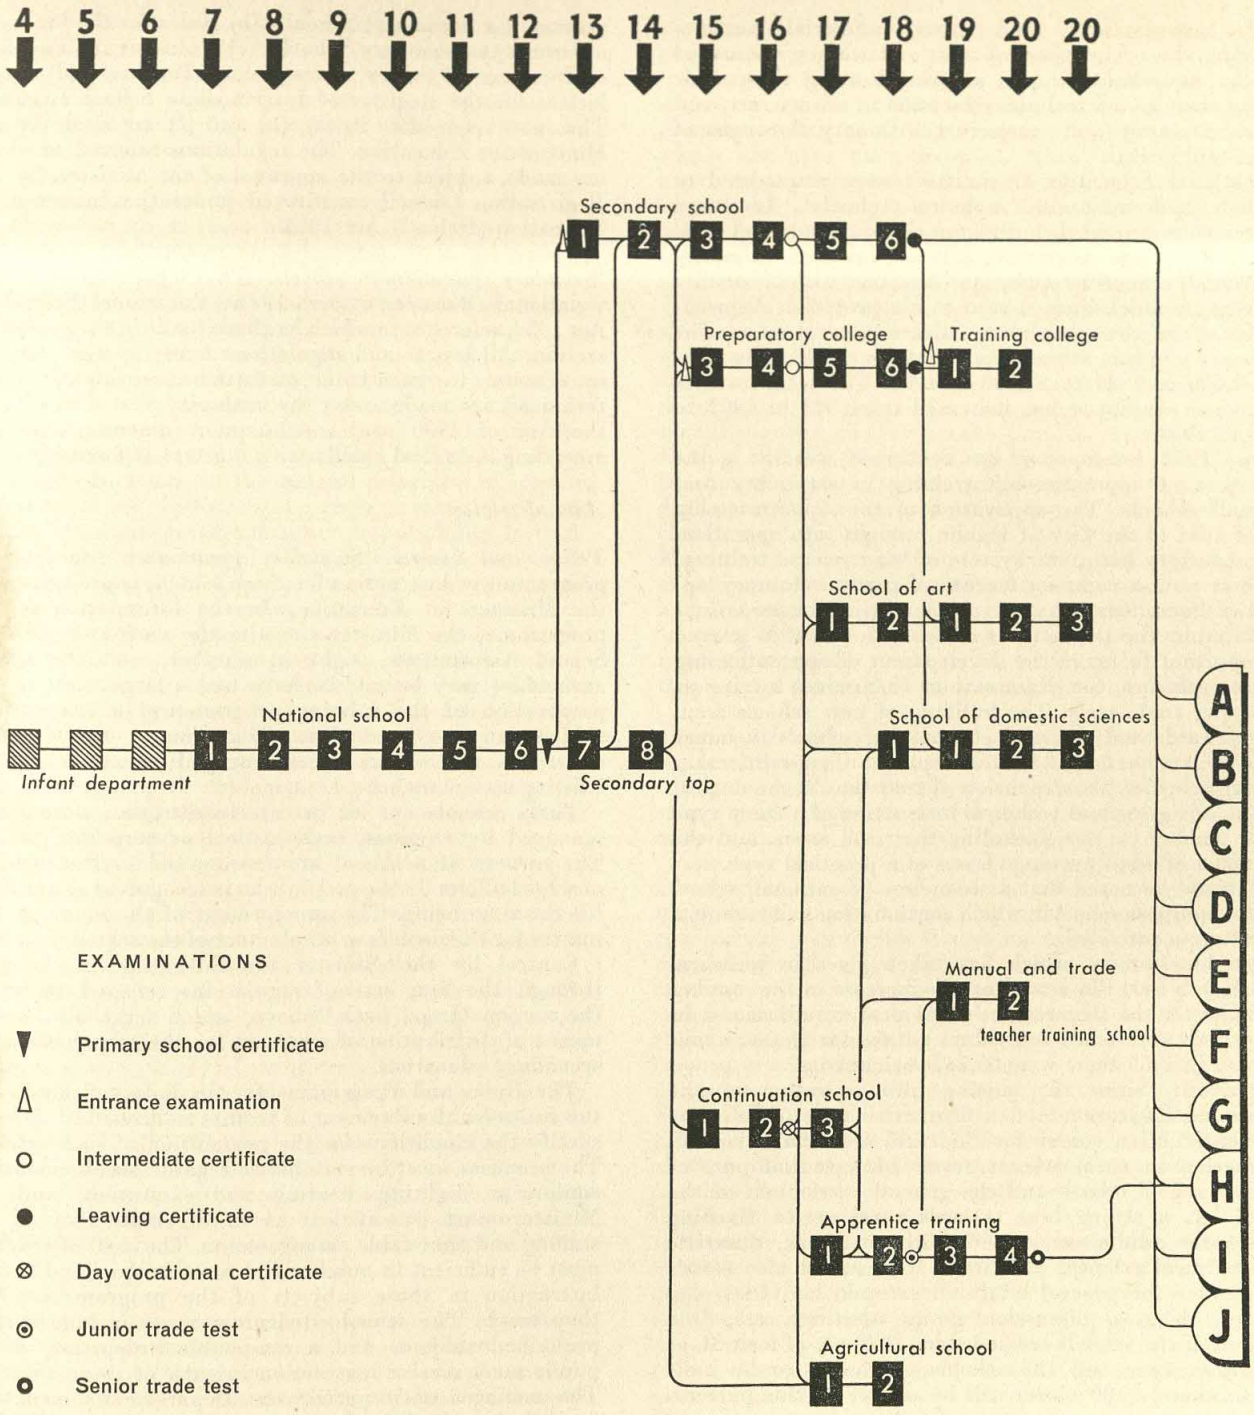
Secondary (grammar) schools. This system dates from the establishment of the Intermediate Education Board under the Intermediate Education (Ireland) Act in 1878. The purpose of this Act was to promote intermediate secular education through the introduction of a system of public examinations, on the results of which (a) exhibitions, prizes, medals and certificates would be awarded to deserving candidates, and (b) fees would be paid to schools. The board was empowered to frame regulations for and to conduct these examinations. A series of later Intermediate Acts increased the financial provision for and extended the powers of the board, e.g., the Act of 1900, which enabled them to appoint a number of inspectors, and to advance money to school managers for the provision of science and laboratory equipment and appliances. The most important of these Acts, however, was that of 1914 which provided for: (a) the setting up of a Register of Intermediate School Teachers under the supervision of a Registration Council, and (b) the payment to the board of a sum not exceeding £40,000, referred to in the Act as the 'Teachers' Salaries Grant'. The salaries grant was the first step in the improvement of the status of secondary teachers, as the setting up of the Registration Council was the first step towards the grading of their qualifications. In June 1923, the Intermediate Education Board was dissolved and its functions transferred to the Commissioners for Intermediate Education, who were in turn, under the provisions of the Ministers' and Secretaries' Act of 1924, replaced by the Minister for Education and his Department.

Meanwhile, a representative Commission on Secondary Education had been set up in 1921 and had furnished a

series of Recommendations in 1922. As a major step towards realizing these recommendations, the Intermediate Education (Amendment) Act, 1924, was introduced. This Act provided, *inter alia*, that the various grants hitherto payable to secondary schools should be replaced by one grant payable on a capitation basis in respect of all recognized pupils who followed an approved course of study and made a prescribed number of attendances during the school year. Up to that year, secondary teachers had not been paid by the State. The new system now introduced provided that a secondary school be required to employ a certain number of registered teachers in proportion to the number of its pupils, and that each of these teachers should be entitled to receive a prescribed minimum basic salary. In addition to such basic salary, it was provided that teachers would receive direct from the Department of Education increments based on the length of their approved teaching service. The present schemes of secondary schools' capitation and other grants and of secondary teachers' salaries, together with the programme and examination system, all derive from the 1924 Act and from the Recommendations of the Commission on Secondary Education referred to above.

Secondary (vocational) schools. The passing of the Technical Instruction Act by the British Parliament in 1889 marked the first real attempt to deal with the question of technical education on a comprehensive and organized basis. The Act empowered local authorities (in Ireland, the urban or rural sanitary authority) to formulate schemes of technical instruction and to raise a rate in aid of such instruction. It also empowered the local authority to appoint a committee to act on its behalf in the administration of the Act. However, the total moneys available (from grants and rateable contributions) were, outside the cities, entirely inadequate to finance the schemes of instruction envisaged. The City Corporations were the only bodies which could carry out the provisions of the Act to any extent. To remedy the situation the Agricultural and Technical Instruction Act (Ireland) was passed by the British Parliament in 1899 and came into operation in April 1900. A Department of Agricultural and Technical Instruction was established in Dublin with responsibility for the allocation of funds previously administered from London and an annual endowment of £55,000 was provided for the purpose of technical instruction.

Schemes were organized by the new Department for instruction in science, technology, and art in urban areas, and manual instruction, rural industries, and domestic science in rural areas. To administer these schemes statutory committees, consisting of members of the local rating authority and other selected persons, were set up in the different areas. Permanent technical schools were established in the cities and some larger urban areas (by 1927 there were 65 such schools), but in the rural areas instruction was provided mainly by itinerant teachers who gave short intensive courses in woodwork and domestic economy at temporary centres. Instruction, in the main, was confined to afternoon and evening classes, in both urban and rural areas. The schemes were financed by grants from the Department and local rate contributions.



Following the establishment of native Government in 1922, technical education was assigned to the Department of Education in 1924, and two years later the Minister for Education appointed a commission 'to inquire into and advise upon the system of technical education in relation to the requirements of trade and industry'. The principal recommendations made by this commission were embodied in the Vocational Education Act passed by Dáil Éireann in 1930. The Act was later amended to enable additional funds to be provided towards the extension of vocational education. In general, however, vocational and technical education continues to be administered in accordance with the provisions of the Vocational Act of 1930. The Act made provision for a new system of post-primary education known as 'continuation education'. This was defined as 'education to continue and supplement education provided in elementary schools and includes general and practical training in preparation for employment in trades, manufactures, agriculture, commerce, and other industrial pursuits and also general and practical training for improvement of young persons in the early stages of such employment'. The Act gave Vocational Education Committees, to which the immediate control and organization of vocational education was assigned, power to establish and maintain 'continuation schools'. The Act also made provision for the continuance and expansion of technical education, which it defined as 'education pertaining to

GLOSSARY

agricultural school: vocational training school of agriculture.
apprentice training: part-time trade training school.
continuation school: vocational secondary school with technical, rural, commercial or domestic science courses.
infant department: pre-primary classes attached to *national school.*
manual and trade teacher training school: specialized teacher training course for teachers in vocational schools of trades and industries.
national school: state-aided primary school with infant department and lower secondary top, covering period of compulsory schooling.
preparatory college: state general secondary school for pupils intending to become primary teachers.
school of art: vocational secondary school of fine arts with *preliminary course* leading to *teacher training and diploma course* at higher level.
school of domestic science: upper vocational secondary school of domestic science with course in *housecraft* followed by *teacher training.*
secondary school: general secondary school.
training college: teacher training college.

trades, manufactures, and other industrial pursuits (including the occupations of girls and women connected with the household) and in subjects bearing thereon or relating thereto and includes education in science, art, and physical training (and music in the County Boroughs of Dublin and Cork)'.

Vocational Education Committees were empowered to establish and maintain 'technical schools'. Increased finances were provided, both from central funds and local rates. At present there are 238 permanent secondary (vocational) schools in operation—together with 36 smaller buildings in which limited courses are provided. Approximately 100 of the schools erected are in rural areas. The number of pupils in attendance at day courses has increased from 2,600 in 1927 to 23,000 in 1958. The total number of teachers employed has increased from 822 in 1927 to 2,658 in 1958.

Since 1932 development has continued steadily in the regulation of apprenticeship training in secondary (vocational) schools. The application of the Apprenticeship Act of 1931 in the City of Dublin brought into operation, on a statutory basis, the system of 'day release training' which is now a common feature of many voluntary apprenticeship schemes. A new scheme of trade examinations instituted by the Department of Education in 1935 proved an important factor in the development of apprenticeship training schemes, the examinations themselves serving as qualifying trade tests. The building of new schools from 1930 onwards and the reconstruction of schools in larger urban centres has helped the development of apprenticeship training schemes, the expansion of trade and technological courses, the growth of technical instruction of a trade type in the smaller centres, including the rural areas, and the expansion of adult evening classes of a practical type.

It should be noted that a secondary (vocational) school is a dual purpose school in which continuation and technical education is provided.

The development which has taken place in technical education is best illustrated by the increase in the number of entries for the Department's technical examinations. In 1931 there were 6,305 individual entries for those examinations. In 1958 there were 25,347 such entries.

Gradually, since the coming into operation of the Vocational Education Act, a distinctive type of full-time day continuation course for the rural areas had evolved. Instruction in rural science forms an essential part of the day school course and the general curriculum of the school has a strong bias towards rural needs. Evening courses for adults are provided in woodwork, domestic science, rural science, and Irish. The school also serves as a centre for general adult educational activities, e.g. lectures, debates, discussion group meetings, etc. One hundred of the schools erected since 1930 are of a rural, or semi-rural, type and the schools remaining to be built (approximately 100 more) will be mostly of this pattern.

Legal basis

Secondary (grammar) schools. The principal laws are the Intermediate Education Acts 1878 to 1924, the substance of which has been given in the preceding section. The principal rules and regulations are: (a) Rules and Programme for Secondary Schools; (b) Rules for the Payment of Grants to Secondary Schools; (c) Rules for the Payment of Incremental Salary to Secondary Teachers; (d) Regulations for the Register of Intermediate School Teachers. The rules referred to in (a), (b) and (c) are made by the Minister for Education. The regulations referred to in (d) are made, subject to the approval of the Minister, by the Registration Council constituted under the Intermediate Education (Ireland) Act 1914.

Secondary (vocational) schools. The legal basis of the vocational education system is the Vocational Education Act 1930, reference to which has been made in the preceding section. All orders and regulations made by the Minister in relation to vocational education (continuation and technical) are made under the authority vested in him by the Act of 1930 or its subsequent amendments. The amending Acts deal chiefly with matters of finance.

Administration

Policy and control. Secondary (grammar) schools. The programme of instruction for these schools is prescribed by the Minister for Education. In the formulation of the programme, the Minister consults the various Secondary School Associations, eight in number, and the school authorities may be said to have had a large share in the preparation of the existing programmes in the various subjects of the curriculum. The Council of Education referred to above is at present engaged on a review of the existing secondary school curriculum.

These schools are all private institutions, owned and managed by religious, ecclesiastical or corporate bodies. The owners of a school are represented in the conduct of school affairs by the person who is recognized as manager for the time being. The appointment of the manager is a matter for the owners or conductors of the school.

Control by the Minister for Education is exercised through the four sets of regulations referred to under the section 'Legal basis' above, which serve also as the means of distribution of state aid for the advancement of secondary education.

The Rules and Programme for Secondary Schools and the Rules for the Payment of Grants to Secondary Schools specify the conditions for the recognition of such schools. The premises must be suitable as regards accommodation, equipment, lighting, heating and sanitation, and the Minister must be satisfied as to the suitability of the staffing and time-table arrangements. The staff of teachers must be sufficient in number and must be qualified to give instruction in those subjects of the programme which they teach. The school curriculum must include certain prescribed subjects and a reasonable proportion of the pupils must receive instruction in each of those subjects. The manager must permit the Department's inspectors to visit the school for the purpose of testing the efficiency of the instruction given and of ascertaining if the Department's regulations are being observed. The rules also provide for the withdrawal of recognition from a school in certain circumstances—where the attendance falls below 12 pupils or where the instruction given in the school is inefficient.

Secondary (vocational) schools. These schools are under the immediate control of 38 Vocational Education Committees composed of members of the local rating authority and other selected persons. The committee is appointed by the local rating authority and holds office for the same period as that authority; it is an independent statutory body and not a sub-committee of the rating authority. Committees can frame their own programmes within the general powers given them under the Act, subject to the approval of the Minister for Education. It is the duty of every committee to establish and maintain in its area a suitable system of continuation education, and to supply or aid the supply of technical education in its area.

For these purposes committees are empowered, *inter alia*, to establish and maintain schools and courses of instruction and are required to appoint teachers and such other staff as may be necessary. Committees in cities are also empowered to establish and maintain Day Technical Colleges to provide education 'in the general principles of science, commerce, or art suited to the requirements of persons employed in positions of control or responsibility in trade or industry'. The principal officer under each committee is the Chief Executive Officer, who acts as secretary and directs and supervises the educational scheme for the area.

Each committee prepares annually, and submits to the Minister for Education for approval, an educational scheme setting out the courses of continuation and technical instruction it is proposed to provide. The scheme, after examination by the Department, is usually approved by the Minister, sometimes with amendments. The scheme, when approved by the Minister, is put into operation by the committee and time-tables of all courses and classes are submitted in due course to the Department.

While the immediate control of vocational education is in the hands of the Vocational Education Committees the Minister exerts an overriding control through powers of sanction and approval, as well as through the direct powers specifically reserved to him under the Act.

In practice, a great deal of the actual control is in the hands of the Chief Executive Officer who supervises the administration of the scheme prescribed for the area and the day to day work of the committee. The headmaster has immediate control of the school of which he is in charge. Proposals for the appointment of teachers and headmasters are subject to the Minister's approval and the actual appointments must also be sanctioned by him. The Chief Executive Officer is appointed as a result of a competition held by a statutory board—the Local Appointments Commission—and in accordance with qualifications specified by the Minister for Education.

Supervision and inspection. The inspection of secondary schools, grammar and vocational, is conducted by the inspectorate of the Department of Education. The inspectors are recruited through a statutory board, the Civil Service Commissioners, and are university graduates with an honours degree or, for vocational school inspectors, an equivalent qualification, and a very good knowledge of the Irish language. A specified minimum period of teaching or industrial experience is usually required of the applicant as a condition of eligibility to compete for the post. An inspector is a specialist in his subject and is expected to keep himself fully abreast of all developments in his particular field of study subsequently.

The main functions of the inspectors are to examine and report on the work in the schools, the condition of the premises and the general staffing arrangements. They also advise teachers on syllabuses, work programmes and improved teaching methods. Secondary (grammar) school inspectors exercise general supervision over the Secondary School Entrance Examination, prepare question papers for the Intermediate and Leaving Certificate examinations and supervise the marking of the answer books.

Specialist inspectors of secondary (vocational) schools also act as co-examiners in the Department's examinations; they assist in the selection of teachers for training and conduct final qualifying tests for teachers. They assist in the organization of refresher courses for teachers and other special courses and they take part in interview boards dealing with the selection of candidates for special courses. District inspectors (vocational), in addition to the above duties carry out general inspection of all schools and classes in their districts; they consult with the Chief Executive Officer regarding the planning and organization of courses and examine and report on the annual educational and financial schemes. They inspect, and assist in the selection of school sites and advise on the accommodation required in schools proposed for building. When required, they attend meetings of Vocational Education Committees.

Finance. Secondary (grammar) schools. These schools are financed through: capitation and other grants paid to the manager by the Department of Education; incremental salary paid to the teachers by the Department of Education; students' fees and scholarships.

The fees charged vary according to circumstances and are fixed at the discretion of the schools concerned. The majority of pupils attend day schools, where the fees charged are well within the means of the average parent. Scholarships awarded on the results of a competitive examination and tenable in these schools or in secondary vocational schools, are awarded annually by the County and County Borough Councils to children of the lower income groups. These scholarships vary in value up to £85 per annum and are tenable for a period of 4 to 5 years. In addition a limited number of scholarships and prizes are awarded annually by the Department of Education on merit, without regard to income, on the results of a special examination and on the results of the Intermediate Certificate Examination.

Payment of teachers in these schools comprises two elements, basic salary paid by the school authorities (a minimum of £200 per annum for non-resident teachers) and incremental salary paid by the Department of Education. Scales of 'standard salary', i.e. incremental salary plus minimum basic salary of £200 per annum, are at present (1959) as follows: women and single men, £443–£806 (17 increments)—married men £486–£1,018 (18 increments). Children's allowances and rent allowances (non-pensionable) are paid in addition to the salary scales for married men. Allowances are also payable to all teachers for honours degrees and for teaching through the medium of Irish. There is a 5 per cent deduction from all pensionable emoluments for superannuation purposes.

No state aid is provided for the building and equipment of the schools. State grants are not available for welfare services in these schools.

Secondary (vocational) schools. Each Vocational Education Committee has a Vocational Education Fund, operated through a bank, out of which all expenditure is met. The annual income of committees is derived from three main sources, namely, grants from the Department of Education, a local contribution from the Rating Authority, and the balance (comparatively small) from tuition fees and miscellaneous sources. Subject to the approval of the Minister, committees may charge fees for attendance at courses of instruction except in the case of compulsory courses under Part V or Part VI of the Act of 1930; the fees charged range from 2/6 to £1 for evening classes and from 10/- to £3 for full-time continuation courses. Fees are frequently remitted in whole or in part in necessitous cases. Many committees award scholarships which cover tuition fees and class materials; a number of committees award travel-aid scholarships to students coming long distances to school. With the consent of the Minister for Education, committees may borrow money to meet capital expenditure and, with the consent of the Minister for Local Government, the rating authorities may also make grants to committees for the same purpose. The manner in which a committee proposes to spend its funds is shown in an annual financial scheme setting out the total estimated revenue and expenditure, which is subject to the approval of the Minister for Education. Where an increase in the annual local contribution is budgeted for, the proposed increase must be approved by a special estimates sub-committee, comprised of the members of the local rating authority (who are also members of the Vocational Education Committee). When the scheme has been finally approved by the Minister for Education and the prescribed certificate issued, the local authority must (unless the proposed increase exceeds 1d. in the £) pay on demand to the Vocational Education Committee the contribution specified in the certificate. Committees are allowed, subject to the sanction of the Minister, to proceed by yearly instalments—of not more than 2d. in any one year—to a maximum demand, on the local rating authority, of 1/3 in the £ (where the demand increase exceeds 1d. in the £ the rating authority must agree to the proposed excess). The average local contribution from the rating authorities to Vocational Education Committees is now (1959), approximately 1/- in the £.

The biggest item of expenditure is payment of teachers' salaries. Permanent full-time teachers are paid according to salary scales authorized by the Minister for Education. The present (1959) scales are as follows: women and single men, £450–£760 (15 increments), married men £526–£961 (16 increments). Allowances and deductions for superannuation purposes are as for secondary (grammar) school teachers.

Buildings and equipment are financed in either of two ways, namely, by borrowing by the Vocational Education Committee on the security of its own funds or by grants from the local rating authority. Schools vary in size from small three-roomed schools in rural areas to large technical institutes in cities. The average school has usually five classrooms for, respectively, woodwork, metalwork, science or rural science, domestic science, commerce and general subjects. Standards of space vary according to the nature of the classroom and range from 600 square feet for a science room to 880 square feet, with storage accommodation up to 250 square feet, for woodwork and metalwork rooms.

TYPES OF SECONDARY EDUCATION

When a pupil has completed his course of education in the national (primary) school at the age of 13–14 years he has the choice of proceeding to either a secondary (grammar) or secondary (vocational) school. The choice of school is not influenced by the Department of Education but is a matter for decision by the child's parents. The curriculum of the secondary (grammar) school is of the academic type; the secondary (vocational) school aims at continuing the pupil's education in Irish, English and mathematics and at the same time makes provision for practical subjects such as manual instruction, rural science, domestic science, commerce. The complete course of the secondary (vocational) school is generally of about 2 years' duration. Thus pupils whose parents do not wish them to continue at school beyond the age of about 16, as well as pupils who desire to follow later a technical course of study, will in most cases chose a secondary (vocational) school in preference to a secondary (grammar) school. In general the secondary (vocational) school may be regarded as having for its aim the improvement of young people who will engage in trades or other practical types of occupation, whereas the secondary (grammar) school will be expected to fit its students for posts secured through competitive examinations or to qualify them for admission to the universities or institutions of similar standing.

It should also be mentioned that managers of national (primary) schools may on certain conditions obtain recognition for courses of instruction in the secondary (grammar) school programme. For such recognition to be granted a high standard must be maintained in the work of the ordinary primary classes of the school and the staff in charge of the classes following the secondary programme must be adequate in numbers and qualifications. The accommodation must be suitable. It is a further condition for recognition of these courses in national schools that secondary education is not otherwise available to the pupils or within the means of their parents.

The school year for secondary (grammar) schools is from 1 August to 31 July; the actual period of operation is from about the first week of September to the middle of the following June. Vacation periods at Christmas and Easter are about 3 weeks and 2 weeks respectively. The school week extends from Monday to Saturday with a half-day free on Saturday and on one other day during the week. The school day usually begins at 9 a.m. and finishes at 3.30 p.m. with a break of 1 hour for lunch at 1 p.m. The usual duration of a class period is 45 minutes.

The school year in schools under Vocational Education Committees is from 1 September to 31 August. Full-time day continuation courses operate from about the first week in September to the end of June. Short vacation periods

are allowed at Christmas and Easter. The school week has a minimum of 25 hours. The majority of schools work from Monday to Friday, with a free day on Saturday. In city and some urban schools there is usually a free half-day during the week, with class for a half-day on Saturday. The school day is usually from 10 a.m. to 4 p.m. in rural schools, with a break of 1 hour for lunch at 1 p.m. In urban and city schools classes usually start at 9.30 a.m. and go on to 4.30 p.m. or sometimes 5 p.m.

General secondary schools

The curriculum of a secondary (grammar) school must include instruction in a syllabus approved by the Minister for Education in the following subjects: Irish, English, history and geography, mathematics, and science, or a language other than Irish or English, or commerce. It should also include provision for singing and physical training or organized athletic games, and domestic science in schools for girls.

A pupil may not be admitted to an approved course of study in a secondary (grammar) school unless he is sufficiently advanced in knowledge and intelligence to enable him to follow, with reasonable success, a course of secondary education. In order to test the pupils' capabilities in this respect the manager of the school must cause an entrance examination of new pupils to be held generally not later than 15 October each year. Pupils who have passed certain specified examinations conducted by the Department of Education based on the sixth and seventh standard programmes in the national (primary) schools may be exempted from the entrance examination, if the manager so desires.

The normal duration of the course is 5 to 6 years—3 or 4 years as a junior pupil following the course for the Intermediate Certificate examination and 2 years as a senior pupil following the course for the Leaving Certificate examination. The purpose of the Intermediate Certificate is to testify to the completion of a well-balanced course of general education suitable for pupils who leave school at about 16 years of age, and, alternatively, to the fitness of the pupils for entry on more advanced courses of study in a secondary (grammar) or secondary (vocational) school. The approved course for pupils for this certificate must include not less than 6 of a list of 21 specified subjects, 4 of which must be Irish, a second language, history and geography (1 subject) and mathematics. To pass the examination and qualify for the award of the certificate a pupil must, as a rule, pass in 5 subjects, which must include Irish and, in the case of boys, mathematics.

The aim of the Leaving Certificate is to testify to the completion of a good secondary education and to the fitness of a pupil to enter on a course of study at a university or an educational institution of similar standing. Senior pupils who have followed an approved course in Irish and 4 other subjects of a specified list of 23 subjects for 2 years are eligible for admission to the examination for the award of the certificate. The Leaving Certificate (pass) is awarded to a candidate who reaches the pass standard in Irish and in at least 4 other subjects or who obtains honours in 3 subjects and a pass in a fourth, Irish being 1 of the 4 subjects.

Candidates at both the Intermediate and Leaving Certificate examinations may be awarded honours in individual subjects and at the examination as a whole if they attain certain specified standards. The examination in any subject does not include an oral test at present but it is proposed to introduce such a test as part of the examination in the subject Irish at the Leaving Certificate stage as from 1960 onwards. The prescribed subjects for the certificate examinations are as follows: Irish, English, Latin, Greek, French, German, Italian, Spanish, Hebrew, history, geography, mathematics, science (including physics, chemistry, botany and physiology and hygiene), agricultural science, music, art and drawing, manual instruction and commerce.

Teaching staff. In order to become a registered teacher in a secondary (grammar) school an applicant must: (a) (i) hold a degree of a university in Ireland or Great Britain or of such other university as may be recognized for this purpose and a recognized qualification in training in teaching of such university obtained after attendance at a satisfactory course of training in the theory and practice of education accompanied by practice in teaching under supervision; or (ii) hold a recognized certificate or diploma in art or domestic science obtained after a satisfactory course of study in a school or college approved for the purpose or hold the Diploma in Music Teaching of University College, Dublin; (b) have at least one year's satisfactory experience as a teacher in a recognized secondary school under the Department of Education; and (c) pass a test of competency in oral Irish.

A teacher registered in accordance with the provisions of (a) (i) above must have spent at least 5 to 6 years of preliminary preparation subsequent to completion of his course as a student in a secondary school, i.e. 3 to 4 years' study for a university degree, 1 year at least at a course of training in the theory and practice of education accompanied by practice in teaching under supervision and a further one year's satisfactory experience as a teacher in a recognized secondary school. Non-graduate teachers registered in accordance with the provisions of (a) (ii) are eligible to teach only the subject in which they have acquired the particular recognized certificate or diploma. These certificates and diplomas are obtained as a result of the satisfactory completion of a course of specialized study in the subject concerned extending over a period of at least 3 years. In the case of domestic science, the courses accepted are in general those provided in residential training colleges recognized and grant-aided by the Department of Education. The qualification in art may be obtained as a result of satisfactory attendance at the National College of Art or at special courses organized by the Department. The Diploma in Music Teaching of University College, Dublin, can be obtained only as a result of satisfactory attendance at a prescribed course of study in that university.

Teachers may improve their competence in their particular subjects by attendance at special courses organized by the Department from time to time, such as courses in Irish, geography, mathematics, etc.

Vocational and technical schools

All the schools belonging to Vocational Education Committees and providing courses in accordance with the provisions of the Vocational Education Act 1930 are commonly called 'vocational schools'. Technical education as well as continuation education is given in these schools, the preponderance of the work of the schools (75 per cent of the total attendance hours at all types of courses) being, however, in the field of continuation education.

Reference has already been made to the definition of 'continuation education' contained in the Vocational Education Act 1930 and to its growth and development since the passing of the Act. The bulk of the work is done by means of full-time day courses in secondary (vocational) schools. For admission to these courses pupils must have attained the age of 14 years, or be over 13 years and have spent a full year in the sixth standard in a primary school. It is not the practice to insist upon any further qualification for entry, by way of educational attainment or otherwise, except as may occasionally be rendered necessary because of shortage of accommodation.

The curriculum for continuation education in these schools is not a uniform one applicable to boys and girls alike, in city, town and country. The general purpose of helping each pupil to secure his own ultimate good is universal; the immediate purpose of preparation for entry to employment is conditioned by a number of circumstances. Different types of courses are organized, the most typical being: junior technical course (boys); junior rural course (boys); junior domestic science course (girls); junior commercial course (girls, usually).

The general pattern of the weekly programme of 25–30 hours is somewhat as follows: practical subjects—one-third; semi-practical subjects—one-third; literary and general subjects—one-third. Examples of practical subjects are woodwork, metalwork, domestic science, typewriting. Semi-practical subjects comprise subjects such as science, rural science, technical drawing, book-keeping. The literary and general subjects constitute an extension of the work begun in the primary school and the aim is to maintain, and as far as is feasible to increase, the literary and general knowledge of the pupils. Subjects in this section include English, Irish, arithmetic, geography, civics. Religious instruction is included in all courses, and subjects such as art, physical education and choral singing are included wherever possible.

The junior rural course is a course to suit the requirements of boys and girls living in country districts. Rural science and domestic science are major subjects and in addition to the usual practical work in the classroom, kitchen, and school garden the pupils are encouraged to undertake home projects of an agricultural, horticultural, or (in the case of girls) domestic science type.

The duration of these full-time courses is 2 or 3 years, at the end of which time average pupils should have reached the standard of the Day Vocational Certificate. This certificate, which may be regarded as a type of school-leaving certificate, is awarded on the results of examinations conducted by the Department of Education. Basically it is a certificate of competence in a small group (2 to 4) of practical and semi-practical subjects, to which other subjects may be added as options. This certificate has considerable value when employment is being sought and it is essential for entry to certain occupations. There is no obligation on pupils to take these examinations.

Part V of the Act of 1930 contains provision for compulsory attendance at courses of continuation education in any area to which that part of the Act is applied by order of the Minister for Education. In any such area young persons between the ages of 14 and 16 years who are not attending some full-time school, whether in employment or not, are obliged to attend special courses provided by the Vocational Education Committee. As is laid down in the Act, a course consists of 180 hours of instruction per year and an employer must afford time and liberty to a young person to attend without any deduction from wages or any addition to the hours of employment. Part V of the Act is in operation in the cities of Cork, Limerick, and Waterford, and in each area the course is provided through 1 full day (5 hours) of instruction in each of 36 weeks. The courses are supplemented by voluntary evening classes in handicrafts, and other subjects and by a variety of activities of an educational, recreational, or cultural nature.

Reference has already been made to the definition of 'technical education'; as at present organized in schools under Vocational Education Committees it can be classified as follows: full-time technical and technological courses; technical education for apprentices; miscellaneous courses for adults.

Full-time technical and technological courses. For those who wish to secure some form of recognized qualification, such as graduateship of a professional institute, a small number of special full-time courses are available in the larger centres of population. Courses of this type at present in operation include architecture, art, mechanical engineering, surveying, industrial science, electrical engineering, marine engineering, radar maintenance, radio maintenance, radio engineering, radio officers, dietetics, hotel management, institutional management, hospital cooks, hotel cooks, dress designing. Full-time courses leading to the college diploma are also provided at the National College of Art, which is under the direct control of the Department of Education.

Technical education for apprentices. The greater part of the technical education for apprentices is provided by means of evening classes, where attendance is voluntary though in some instances employers encourage attendance and contribute towards the cost of tuition fees. In the cities and in a number of the larger towns, there are special classes confined to apprentices, but in the smaller centres the numbers belonging to particular trades would not justify this arrangement. In such cases apprentices are accommodated in the ordinary classes for adults.

The advantages of providing technical education for apprentices during normal working hours instead of in evening classes has become more widely recognized in recent years, and the principle is now accepted and being put into practice by a substantial number of employers, notably by large national concerns such as the Electricity Supply Board, Córas Iompair Éireann (transport), Bord na Móna (peat development), and Comhlucht Siúcra

Éireann (sugar manufacture). Many retail firms in the City of Dublin allow apprentices time off during working hours to attend courses in retail distribution in the technical schools.

These day courses for apprentices are organized either as day release courses, where the apprentices are released for a number of hours each week, or as 'sandwich courses', where attendance at classes is full-time for some continuous period.

Miscellaneous courses for adults. In all vocational education schemes provision is made for courses for adults, that is, for those who have completed full-time schooling and are as a rule in some occupation or other. These courses are usually conducted in the evening after ordinary working hours. Wherever there is an established vocational school the adult classes are held in that building, but classes are also held in other centres throughout the country in halls, libraries, etc.

In the cities and the larger towns, courses are provided in a wide variety of subjects and many of these are of a specialized nature for persons who wish to receive instruction and training which will be of assistance to them in their occupations. Examples are the courses in the various branches of commerce and business administration, engineering, science and technology, in the major technical institutes. Courses in handicrafts, domestic science subjects, art, music, Irish and other languages, physical education, etc., have a wider appeal.

In the smaller towns and in rural areas the programme of classes for adults is naturally more restricted in scope than in the centres referred to above. In the rural areas, there is a growing demand for courses especially related to actual practical needs and courses in such subjects as farm building and farm machinery are becoming regular features. Courses in rural science are also becoming more definite in aim than hitherto, instruction in fundamentals being supplemented by intensive study of some particular aspect of the subject, such as soil testing. Efforts are also being made with fair success to establish day courses of 1 or 2 days per week for young farmers. These developments are rendered possible by the fact that increasing numbers of young people in the rural areas have learnt the elements of these subjects by attending the junior rural course in a day vocational school.

In the case of courses for rural housewives, there is a tendency in recent years to depart from the usual evening course in some branch of domestic science and to develop courses which cater for all aspects of women's work in the rural homestead. Subjects such as home decoration, poultry-keeping, dairy management, gardening, home-nursing, are being introduced, with assistance from the instructors and officers of the other local authorities when subjects are outside the scope of the teachers attached to the vocational education committee. Other developments in this field include the experiment of conducting classes for small groups of housewives in a dwelling-house and the provision of a home advisory service.

In conjunction with the schemes of technical education which are in operation, the Department conducts examinations annually. These examinations, which are divided to conform as closely as possible with occupational requirements, involve practical, written, and oral tests appropriate to the various subjects and are arranged in stages to suit the different standards. Certificates are awarded to successful candidates.

Teaching staff. The principal types of teachers employed by Vocational Education Committees, their qualifications and training, and the nature of their teaching duties are as follows:

Manual instructors (woodwork) are selected from young men who have some trade experience and are qualified by means of a 2-year training course conducted by the Department of Education. They are recognized for the teaching of woodwork, mechanical drawing, and other allied subjects to both young boys attending the day vocational schools and adults attending evening classes. They are also recognized for the instruction of apprentices to the woodworking and building trades.

Manual instructors (metalwork). Selection, training and recognition are on the same lines as for the woodwork type, substituting metalwork and other engineering subjects for woodwork, etc.

Domestic science teachers are selected from girls who have a good general education to secondary school leaving standard, together with evidence of aptitude for domestic science work. The training course, conducted in two special state-aided colleges, is of 3 years' duration.

Teachers of commerce must hold as a minimum a university degree (B.Comm.). Recognition to teach shorthand or typewriting requires additional qualifications. They may also be recognized to teach general subjects.

Teachers of rural science must hold a university degree (B.Agr.Sc.) together with a certificate of satisfactory attendance at a short course in teaching methods, or they may be selected from young men with practical experience of agriculture who have completed a good course of secondary education and be qualified by means of a 2-year training course conducted by the Department of Education.

Teachers of science must hold a university degree (B.Sc.) or a diploma in science of a recognized technical college.

Teachers of art must hold the diploma of a college of art, together with a success in examinations relating to teaching methods or the Art Teachers' Certificate of the Department of Education. They are recognized for the teaching of all branches of art, including crafts of various kinds.

Teachers of general subjects are usually university graduates (B.A. and/or B.Comm.); for the teaching of Irish an additional qualification—Teastas Timire Gaeilge—is required.

Physical training teachers are required to hold the diploma of a recognized college or institute.

The qualifications for teachers not specified above are prescribed as required.

Other specialized schools

Schools of music (under the Vocational Education Committees) are in operation in Dublin and Cork. Instruction in instrumental and vocal music is provided at various levels. The instruction is mostly on an individual basis but choir and orchestral work is also undertaken. Pupils are

prepared for the different stage examinations of the recognized examining bodies, as well as for other musical competitions.

Art schools are in operation in Dublin, Cork and Waterford. The Cork and Waterford schools are under the respective Vocational Education Committees but the Dublin school—the National College of Art—is directly under the Department of Education. Instruction in the schools is provided at appropriate levels in the different art subjects and students are entered for the various stage examinations of the Department of Education, as well as for other recognized examinations. The National College of Art awards its own Diploma—the Associateship of the National College of Art (ANCA).

Out-of-class activities

Various out-of-class activities are organized by the school authorities and by the students, though the range of such activities varies considerably with the size of the school, whether it is a boarding school or day school, the distance its students have to travel to and from school each day, etc. Debates and concerts are conducted particularly in boarding schools, and out-of-door games are organized through amateur associations to which teams from the schools are affiliated. Many schools have associated past pupils' unions which help to maintain contact between the schools and outside interests and developments.

Out-of-class activities are well organized in most schools under Vocational Education Committees. Students' unions, which are in operation in quite a number of schools, do much to foster activities of this kind. Organized games include football and hurling for boys and camogie and basketball for girls. Interschool matches are played and school league competitions organized.

School drama is a very popular form of out-of-class activity. It is an activity in which day and evening (adult) students can co-operate. Plays are produced locally and at regional dramatic festivals. School debates are held and this is a form of activity which is growing in popularity, especially in the adult evening classes.

The organization of Macra na Tuaithe clubs based on the rural vocational schools has led to a big expansion in home project work, particularly in boys' classes. Most schools organize annual excursions and outings for the day pupils—usually towards the end of the school session.

TRENDS AND PROBLEMS

Secondary (grammar) schools. Recent years have seen a big expansion in the number of students attending secondary (grammar) schools and this interest in the provision of secondary education for their children still continues to grow among parents. New schools are accordingly being opened in more remote localities than formerly and existing schools have to be enlarged. The cost of erecting new schools or extending existing ones places school authorities under the strain of a financial debt which can be extinguished only over a number of years. At the same time standards of equipment have to be maintained or improved to meet the new demands of the more advanced methods of teaching the different subjects of the curriculum. The shortage of science teachers is not acute but it has shown itself in a modified form, while there is a general demand for an extension of the provision for the teaching of the subject in the schools. The standard reached in Irish in secondary schools is satisfactory but there is some disappointment that greater progress is not being made towards the goal of making it the everyday spoken language of the pupils. It is hoped that the introduction of an oral test as part of the examination in the subject at the Leaving Certificate examination from 1960 onwards will contribute to this end by causing greater emphasis to be laid on oral fluency and giving an impetus towards a more widespread use of Irish both inside and outside the school. A report from the Council of Education on the existing curriculum of the secondary school is awaited, and when it becomes available its recommendations as to what modifications or improvements should be made in the curriculum the better to suit it to present-day needs will be considered in consultation with the school associations.

Secondary (vocational) schools. More pupils are now remaining on for a third year in the day vocational schools and, consequently, it is likely that full-time day continuation courses will be organized in the future on a 3, rather than a 2, year basis. In anticipation of this development a new examination is being planned—to meet the needs of pupils who have completed a 3-year course.

The coming into force of new apprenticeship legislation (at present under consideration) is bound to lead to a big expansion of apprenticeship training schemes. More technical training for agriculture will also be required. At the present time the Departments of Agriculture and Education are co-operating in the organization of a special training scheme for young farmers, to be held during the winter months. The courses of instruction will be provided in the rural vocational schools.

Modern developments in agriculture, industry, and commerce are creating new demands for various types of technical education. The system of vocational education is sufficiently flexible to cope with these demands—through the provision of courses and types of instruction suited to modern needs. The future, therefore, would seem to presage a further development of the system in both the fields of continuation and technical education.

STATISTICS

Population (mid-year 1958 estimate): 2,853,000.
Area: 27,136 square miles; 70,283 square kilometres.
Population density: 105 per square mile; 41 per square kilometre.

Summary of school statistics, 1953–57. In 1957/58, total enrolment (not including adults taking part-time and evening courses) was nearly 620,000 pupils, being 21 per cent of the total population. Of these pupils, 81 per cent were in national (primary) schools, 12 per cent in general secondary schools, 4 per cent in vocational schools, 2 per cent in higher education and 1 per cent in special education. In primary and secondary schools, there were as many girls enrolled as boys, though in the teacher training institutions the proportion of girls was about two-thirds. At the university level, only 25 per cent of the students were girls. Of the total reported teaching staff numbering over 21,000 teachers, 54 per cent were women. In the primary schools the pupil-teacher ratio was 37 in 1957/58.

Between 1953 and 1958 primary school enrolment increased by 3 per cent. However the increase in general secondary schools was 21 per cent; in vocational schools, 14 per cent; in teacher training, 13 per cent; and in higher education, 15 per cent. (See Table 1.)

Enrolment trends in secondary education, 1930–57. Enrolment in general secondary schools doubled between 1930 and 1955, and continued to increase by about 5 per cent each year. During the period of 28 years, the proportion of girl pupils increased progressively from 41 to 48 per cent. However, in public vocational schools the trend of girls' enrolment seems to have been the reverse, at least since the period 1941–44. Total enrolment in these vocational schools nearly tripled between 1931 and 1957, and in the last 3 years the increase was also about 5 per cent each year. The number of pupils in teacher training (preparatory) colleges has increased slowly in recent years, after a substantial decline in the 1930s and the early 1940s. Taken altogether, the average total enrolment in secondary schools increased constantly for each 5-year period, and for 1955–57 it was twice as large as for 1930–34. With an apparent decrease in the estimated population 15–19 years old, the enrolment ratio for 1955–57 was more than twice as high as at the beginning of the period covered in Table 2.

Examination results in secondary education, 1953–57. The number of secondary school leaving certificates awarded each year increased by 18 per cent between 1953 and 1957 while the proportion of girls receiving these certificates remained at 52 per cent. The increase in the number of day vocational training certificates awarded between 1953 and 1957 was over 45 per cent. (See Table 3.)

Educational finance, 1957. In the fiscal year beginning in April 1957, total expenditure for education (from the central and local governments and from university funds) amounted to nearly 17 million pounds sterling, averaging about £6 per inhabitant. Recurring expenditure, being about 91 per cent of total expenditure, was distributed by level and type of education as shown in Table 4B.

ISRAEL

THE EDUCATIONAL SYSTEM

The Education Ordinance of 1933 organized education in Palestine in two main systems: the Arab Public System, maintained, administered and inspected by the Government of Palestine, acting through its Department of Education, and the Hebrew Public System, maintained, administered and inspected by the Va'ad Leumi (National Council) elected by the organized Jewish community, acting through its Department of Education, and controlled by the Government Department of Education. That Ordinance also recognized the various private schools existing in the country and provided for grants-in-aid to them out of public funds at the discretion of the Government. The Arab Public System was maintained by government funds from general taxation, though local authorities were allowed to subscribe out of their rates for the payment of additional teachers. The Hebrew Public System was maintained with funds from three main sources—a grant from the Government, contributions by local authorities from their general revenue and/or education rates, and fees paid by the parents.

There was no statutory law of compulsory education, nor was there any legal or administrative machinery for its enforcement.

After the establishment of the State of Israel in May 1948, the Compulsory Education Law, 1949, made attendance at school for the age group 5 to 13 + compulsory

and free. It also laid the responsibility for public education for that group on both the Central Government and the local authorities, and up to 1953 the Government paid part of the teachers' salaries in primary schools, while the local authorities paid the rest and also bore maintenance expenses. In 1953 the Government began paying the full salaries of the teachers in primary schools. In addition, the Government bears the maintenance expenses, fully or partly, of a fairly large number of schools for immigrants in poor localities. The Compulsory Education Law, 1949, also makes attendance compulsory at evening classes, at government cost and free of charge to the student, of youths between 14 and 17 who have not completed a primary school course. The State Education Law, 1953, made primary education a state function and banned outside influence, party or political, from state schools.

Local authorities normally appoint local education committees to deal with the maintenance of schools, registration of pupils, etc. Additional services, e.g. supply of books, food, medical attention, etc., may also be given either gratis if the local budget can afford it, or else a special rate approved in advance by the Minister of Education and Culture can be imposed on parents for the purpose.

A number of private agencies function in the field of education in Israel. Some of them are philanthropic, some are religious, while others are of a social character. Some confine themselves to supplying kindergarten education for children under the age of 5; others maintain systems of primary and sometimes secondary schools of a religious nature with or without government aid (this applies to both Jews and Christians); and still others, mainly labour voluntary bodies, supply education or services for children in public schools in certain localities. There are very few strictly private agencies functioning for the profit of the owners or partners.

The structure of the school system is shown in the diagram on page 703.

THE DEVELOPMENT OF SECONDARY EDUCATION

If secondary education is taken to mean (a) education beyond the primary school age, (b) study for its own sake, especially of the classical texts, and (c) an intermediate step towards higher or professional education, then this kind of education was normal in Jewish life for many centuries, though it applied only to boys and not to all social strata. From the second half of the nineteenth century onwards, with the introduction of modern ways of life and the emergence of Jewish nationalism, secondary education of the Jewish population in Palestine acquired two additional aims: the provision of vocational instruction in agriculture and in trades and industrial occupations, and the efficient and fruitful synthesis of traditional Jewish learning and modern arts and science. Five dates are of importance in this respect. In 1870, before Jewish immigration to Palestine started on an appreciable scale and before the establishment of the Zionist Organization, the Mikve Israel agricultural school was founded near Jaffa. In 1882 the Tora U-Melakha school was founded in Jerusalem for general and vocational training for boys. These two schools, which were at first partly primary and partly secondary, were founded by the Alliance Israélite Universelle of Paris. In 1904 a secondary school, with parallel sections for business and teacher training, was opened in Jerusalem and became in 1914 the well-known Hebrew Teachers' College. In 1906 the Gymnasia Ivrit (now the Gymnasia Herzlia secondary school in Tel Aviv) was established in Jaffa—the oldest secondary school in Israel. In 1913 a Women's Teachers' College was opened in Jaffa, giving 4 years of secondary education. Before the beginning of the first world war two more secondary schools were founded and plans laid for a religious secondary school.

Between 1919 and 1948 great progress was made in secondary education. With the growth of the Jewish population, the number of youths of secondary school age increased, the ideal of settling on the land gained momentum, and the need for further vocational training was felt. At the same time the ideal of education towards a 'Hebrew personality' took root, and so primary and secondary schools tended to became grouped in three main categories: general, *mizrahi* (religious) and labour. This division had no legal foundation, but was sustained by interested parties which worked within the framework of the Department of Education of the Va'ad Leumi (the elected body representative of nationalist Jewry under the Mandatory regime) and through it in the Department of Education of the Mandatory Government.

Non-Jewish secondary education was catered for partly by the Government of Palestine, which opened several secondary schools and added secondary classes to a number of primary schools, partly by Church and missionary bodies—some of their schools dating from Turkish times—and partly by the private enterprise of Muslim or Christian societies or individuals.

Jewish academic secondary education grew in the three main cities (Jerusalem, Tel Aviv and Haifa), in the old villages and in the new settlements. Private or co-operative schools were established. From 1930 onwards, municipal and local authorities started to open municipal secondary schools. Their income was mainly from fees, though to a lesser degree than in the other schools, but eventually small grants by the Va'ad Leumi and local councils were given in the form of scholarships. Moreover most schools agreed to accept free of charge or at reduced rates a small number of needy but promising pupils. Some of the schools had boards of governors and parents' committees which co-operated with the principals of the schools and teachers in educational matters and in seeking means for improvements. Until about 1935, the school course was of 12 years' duration, of which the first 4 years were primary and the rest secondary, following the old European system. This was then changed to 4 classes of secondary education added to the 8 primary grades. In the upper 2 grades (eleventh and twelfth) humanities and science sections were introduced. The continuation classes in the workers' settlements (*kibbutzim* and *moshavim*) began as classes added to primary schools and eventually became complete schools. Each settlement had its own school or a number of settlements had a common school; all these schools were boarding schools, intended to prepare young people for life in the agricultural settlements and therefore stressing natural sciences, especially biology, and practical work in agriculture.

Government Arab schools, private Christian and Muslim schools and some private Hebrew schools entered their pupils for the Palestine Matriculation Examination, held under the auspices of the Palestine Board of Higher Studies in which the Mandatory Government as well as the public used to be represented. This examination was purely external and won the recognition of many universities abroad.

Between the two world wars the Bagrût (Matriculation) examination of the Va'ad Leumi was introduced in the Hebrew schools in co-operation with representatives of the institutes of higher learning in the country and of the Mandatory Government. This examination was in two parts. The first or preliminary part was taken at the end of grade 10 (in Bible, Hebrew grammar and grammar of a foreign language) and was partly external. The second part was taken at the end of the twelfth year and consisted of six subjects—literary composition, Bible, English, mathematics and two additional subjects to be selected according to the branch of studies chosen by the student. This was normally an external examination, and the candidate had to get a 'pass' mark in all subjects except one, in which a lower mark was accepted. In the case of pupils from well-reputed schools, their school marks in grades 11 and 12 were taken into account in the award of the final marks. The Bagrût certificate was accepted for admission by all institutes of higher learning in the country without further examinations. In the 1940s, external examinations were introduced for candidates who, owing to war conditions and other reasons, did not attend secondary schools. This examination was of the same standard as the regular examination but candidates who did not have a certificate of 10 years' school attendance were required to pass preliminary examinations in a number of school subjects.

Non-Jewish vocational and agricultural education in Turkish times and under the British régime was on a small scale and restricted almost entirely to Christian missionary efforts, except for the Kadoorie agricultural school in Tulkam and the Technical School in Haifa Bay which were established and maintained by the Palestine Government.

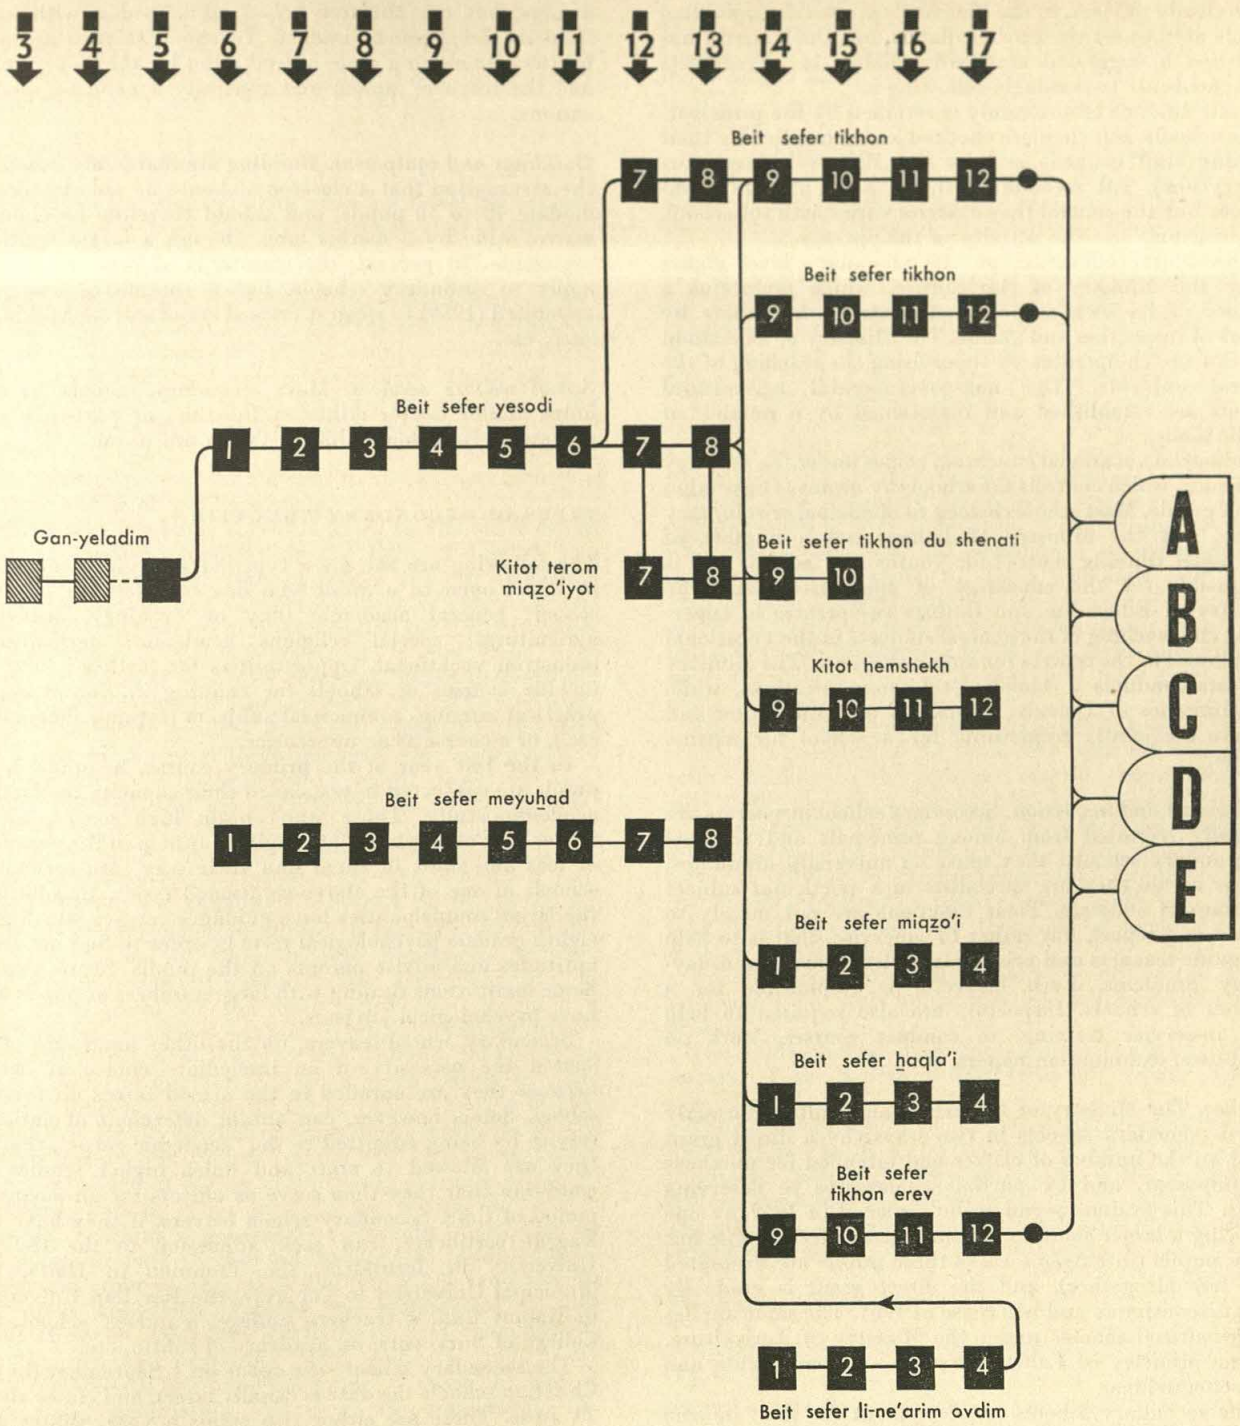
Legal basis

There is no special law governing secondary education in Israel. The State Education Law, 1953, though intended to regulate primary education deals also with teachers' colleges for primary schools. None the less, the Ministry of Education and Culture has laid down a number of regulations concerning the licensing of teachers in secondary schools, the Bagrût examinations, reduced school fees, etc.

Administration

Although there is no law on the subject (1959), secondary education is in fact the responsibility of the Ministry of Education and Culture, and the Ministry has a division of secondary education and a number of inspectors (supervisors) of secondary schools. The head of the division has regular meetings with these inspectors at which the progress of the schools is reviewed and ways and means of improving matters are discussed. When specific recommendations are agreed upon or matters of importance are met, they are referred either to the 'pedagogic secretariat' of the Ministry if they are mainly of an educational nature, or to the Director-General if they are of an administrative or more general character, and they may then be brought before the management board of the Ministry, and eventually before the Minister himself. The initiative for reforms and changes need not rest with the division of secondary education: it can and sometimes does begin with the Ministry, or the Knesset (Parliament), or the Director-General, or with other officers of the Ministry.

Curricula, notes on method, suggestions and regulations are published in the Director-General's circular. There is a unit in the Ministry for the approval of textbooks, and textbooks for secondary schools are dealt with by appropriate experts and committees. The syllabus of the Bagrût school-leaving examination is generally approved by a joint committee of representatives of the Ministry, the Hebrew University of Jerusalem, and the Technion (the Israel Institute of Technology) of Haifa, inasmuch as the Bagrût certificate grants admission to those institutions.



Control. The provision of secondary education is a function which the Government has not yet (1959) assumed. The control of secondary education is therefore left almost entirely to the owners of the schools, i.e., municipal and local authorities or public bodies or individuals. The licensing of teachers is in the hands of the Ministry, but they are appointed and dismissed by the owners, subject,

GLOSSARY

beit sefer haqla'i: vocational secondary school of agriculture.
beit sefer li-ne'ari'm ovdim (school for working youth): compulsory evening classes for 14 to 17-year-olds who have not completed primary school.
beit sefer meyuhad: school for handicapped and/or maladjusted children.
beit sefer miqzo'i: vocational secondary schools of industries and trades, and home economics.
beit sefer tikhon: general secondary school, sometimes including the two upper classes (7 and 8) of the primary course.
beit sefer tikhon du shenati: 2-year secondary school with pre-vocational training.
beit sefer tikhon erev: evening school providing general secondary education.
beit sefer yesodi: primary school.
gan-yeladim: pre-primary school, attendance being compulsory (and free) for 5-year-olds.
kitot hemshekh: secondary classes attached to rural primary schools in labour settlements and taking no examinations, referred to in the text as 'continuation classes'.
kitot terom miqzo'iyot: pre-vocational classes.

HIGHER EDUCATION

A. Universities: the Hebrew University, Jerusalem; the Municipal University, Tel Aviv; and the Bar-Ilan University, Ramat Gan.
B. Technion (the Israel Institute of Technology), Haifa.
C. Institutes for higher vocational education.
D. Teacher training colleges.
E. Academies of music, art, etc.

theoretically at least, to the Ministry's approval. Individual schools used to set their own syllabus, but the Ministry has published a suggested standard syllabus in all subjects and schools are increasingly following it.

A fair amount of autonomy is retained by the principals of the schools, but they are checked and controlled by their teaching staff councils and by the Ministry's inspectors (supervisors). All secondary schools have parents' committees but the control they exercise varies with the school, the principal, and the activity of the parents.

Agricultural education at the secondary level comes under the Ministry of Agriculture, which maintains a number of its own schools and controls the others by means of inspection and grants. The Ministry of Education and Culture co-operates by supervising the teaching of the general subjects. The non-governmental agricultural schools are established and maintained by a number of public bodies.

Industrial vocational education comes under the Ministry of Labour, which controls the schools by means of inspection and of grants. Most schools belong to municipal or voluntary bodies, but the Ministry of Labour has a number of vocational training centres for youths and adults, and is responsible for the education of apprentices, and the Ministry of Education and Culture co-operates in supervising the teaching of the general subjects in the vocational schools and in the centres for apprentices, etc. The Ministry of Posts conducts a school of telecommunications, while the Ministries of Defence, Transport and Education and Culture are jointly responsible for a school for marine officers.

Supervision and inspection. Secondary school inspectors are generally recruited from among principals and teachers of secondary schools; they must be university graduates, and as a rule they are specialists in a particular subject or group of subjects. Their functions are not merely to inspect and report, but rather to supervise, that is to help and guide teachers and principals in their general and day-to-day problems. Each inspector is responsible for a number of schools. Inspectors are also required to help with in-service training, to conduct courses, work on syllabuses, examination papers, etc.

Finance. The Ministry of Education and Culture formerly helped secondary schools in two ways: by a direct grant based on the number of classes and intended for purchase of equipment, and by partial scholarships to deserving pupils. This system began to be replaced in 1957 by one involving a larger share in the payment of fees of able but needy pupils (in extreme cases these pupils are exempted from fees altogether), and the direct grant is gradually being discontinued and will cease in 1961. The same applies to agricultural schools under the Ministry of Agriculture, but the Ministry of Labour continues to pay grants and give scholarships.

Thus secondary schools are dependent for their income on (a) fees and (b) allocations from their owners if they are public bodies such as municipalities, local councils, voluntary agencies, churches, etc. This accounts for the very small number of schools owned by private individuals for profit. Buildings and equipment are supplied by the owners, but the Ministry helps public bodies with loans from its development budget. Teachers' salaries are paid by the owners on a scale agreed upon by the Government and the teachers' union, and generally depend on qualifications.

Buildings and equipment. Building standards are based on the assumption that a classroom should be able to accommodate 40 to 50 pupils, and should therefore be about 7 metres wide by 8 metres long, though a larger width is preferable. In general, the standards of primary schools apply to secondary schools, but a committee has been appointed (1959) to suggest revised standards for buildings, sites, etc.

School welfare services. Most secondary schools have a nurse and/or doctor either in full-time or part-time employment. No other welfare services are usual.

TYPES OF SECONDARY EDUCATION

The following are the main types of secondary education in Israel open to a pupil who has completed a primary school: general academic (day or evening); academic agricultural; special religious academic; agricultural; industrial vocational. Opportunities for further education include courses or schools for training in, for example, practical nursing, commercial subjects (typing, shorthand, etc.), or a course as an apprentice.

In the last year of the primary course, in grade 8, all pupils are subjected to tests as to their capacity for further academic study. Those who obtain high marks, about 30 per cent of all pupils, are eligible for help in the payment of fees and most of them find their way into secondary schools of one of the above-mentioned types. In addition, the larger municipalities have guidance centres which give eighth graders psychological tests in order to find out their aptitudes and advise parents on the pupils' future career. Some institutions dealing with large numbers of pupils also have psychological advisers.

Secondary school leavers, on the other hand, are often spared the necessity of an immediate choice of career because they are enrolled in the armed forces on leaving school. Some, however, can obtain deferment of national service by being admitted to the 'academic corps', that is, they are allowed to start and finish higher studies on condition that they then serve as officers for an adequate period of time. Secondary school leavers, if they have the Bagrût certificate, can seek admission to the Hebrew University in Jerusalem, the Technion in Haifa, the Municipal University in Tel Aviv, the Bar Ilan University in Ramat Gan, a teachers' college, a nurses' school, the College of Surveyors, an academy of music, etc.

The secondary school year opens on 1 September (in the Christian schools the date is usually later), and closes about 23 June. There are either two terms a year, winter and summer, or three, with breaks in December (Hanuka for Jewish schools or Christmas for Christian schools) and March or April (Passover or Easter). Schools close on religious holidays, according to the religion of the school. The school week is of 6 days with a break on Saturday in Jewish schools,

and of 5 or 6 days in non-Jewish schools with a break usually on Friday and Saturday or Friday and/or Sunday. The school day in Jewish schools is normally from 8 a.m. to 2 p.m. in one shift, and in non-Jewish schools generally 8 a.m. to 12 noon and 1.30 p.m. to 3.30 p.m.

General secondary schools

The Hebrew general secondary school in Israel has evolved a number of types: the 4-year school after 8 primary years, the 6-year secondary after 6 years' primary, the so-called 'continuation classes' and 'educational institutions' of labour settlements, the religious academic 4-year schools, the recently established 2-year schools after 8 primary grades, and the academic agricultural semi-comprehensive schools.

The Arab municipal general secondary school offers a 4-year course based on 8 years' primary schooling, while the Christian secondary schools differ according to their country of origin and generally give an 11-year primary-plus-secondary course as opposed to the 12-year course in Hebrew and Arab public schools.

The 4-year academic school is based on the old Western European pattern modified in the light of English and American usage. This type of school aims at imparting general education and the development of character and personality, and serves as a preparation for further studies at institutions of higher learning. As a rule, there is no special selection of pupils on admittance, and theoretically every primary school leaver can enrol. With the increasing number of eighth graders who have qualified in the tests for scholarships and reduced fees, and the inadequacy of accommodation, schools prefer to accept those who have passed the test and are eligible for aid. A fair number of pupils used to leave in mid-course, i.e., after grade 10, but the tendency towards selection and the newly established 2-year course schools may remedy this defect. Differentiation by aptitude is effected by means of the branches of specialization offered in the different sections in grades 11 and 12. These include: humanities, biology, mathematics-science, Oriental studies, agriculture, etc.; in Israel it is usual for the more gifted pupil to select a mathematics or science section. In religious schools greater emphasis is given to study of the Talmud. The subjects taught and the number of lessons given weekly in some of these branches are shown in the table. The first foreign language is usually English or sometimes French; the second foreign language is French (or English), Arabic or Latin. The level aimed at is that of university entrance of a high standard, and in some subjects an advanced level is possible. Teaching is generally on 'Socratic' lines, that is, the pupils prepare themselves through the study of textbooks and other sources while the role of the teacher is to test their knowledge, correct and supplement it, and guide them on. Oral and written tests and examinations are the rule and promotion from grade to grade is on achievement. All the pupils in grade 12 enter the Bagrût final state examination, and those who pass obtain the Bagrût certificate, qualifying for entry to a university. A school leaving certificate has recently been introduced which schools may award to all pupils on finishing grade 12 but which does not entitle them to admission to higher studies.

A 6-year secondary school is similar to the 4-year school except that grades 7 and 8 are attached to it, and there is thus a fuller syllabus, making it possible to expand the scope and/or depth of the syllabus of grades 9 to 12. The number of schools which follow this pattern is still very restricted.

The 'continuation classes' or 'educational institution' type of 4-year school is to be found only in labour settlements of the *kibbutz* or *moshav* type and is intended for the children of *kibbutzim* or *moshavim*, though outsiders are accepted. In these schools there are no examinations and the pupils are not entered for the Bagrût examination, but individuals or groups sometimes take it as external candidates. Each school may have its own syllabus, and as a rule stress is laid on science and also on art. A fair amount of time is given to practical agriculture.

The special religious academic 4-year schools are few in number and are intended to give a religious education of a high order coupled with a formal academic secondary education. They are all situated in agricultural settlements.

The 2-year secondary school with vocational or agricultural training is an innovation (1959) meant for pupils who, *prima facie*, will not complete a 4-year course. In particular it is intended for those who have had a pre-vocational or pre-agricultural intensive course in grades 7 and 8, and who will thus on completion of this school have had 4 years of training in a trade or in agriculture and will have a chance of working in their field for 2 years before being called up for military service.

The academic agricultural semi-comprehensive 4-year school is a compromise for those who want a full academic course leading to the ordinary Bagrût examination and also a full agricultural theoretical and practical training as a preparation for life on the land. A small number of 4-year agricultural schools have therefore adapted themselves to offering an enriched curriculum and entering for the Bagrût examination those of their pupils who wish to take it. These schools may therefore be considered in a sense as comprehensive.

Evening secondary schools are generally of the 4-year academic type, with humanities and mathematics-science branches.

The tables below show the subjects taken in various sections of the 4-year general secondary school and the time allotted.

The teaching staff are required to be university graduates, with at least an M.A. for teachers of grades 11 and 12. In practice, however, a large proportion of the teachers are still not graduates but are retained because of long service. The situation is expected to improve with the increasing output of graduates from the universities.

Vocational and technical schools

Vocational and technical education towards a career is not regulated by law, although the Apprenticeship Law, 1953, provides that no youth under 18 shall be accepted in certain trades to be named by the Minister of Labour except as an apprentice unless he has completed vocational school. The trades so far named are printing, carpentry and metalwork.

Schools are mainly of the 3 or 4-year type, with a smaller

number of 2 or 1-year schools, and in addition there are part-time courses. As mentioned above, agricultural and fishery schools and courses are under the Ministry of Agriculture, while other vocational and technical schools and courses (with a few exceptions such as the school of telecommunications) are under the Ministry of Labour.

Part-time courses are intended for youths already in employment or preparing for immediate employment. The 'sandwich' system of alternating full-time schooling with work is not followed in Israel. In agricultural and vocational 3- and 4-year schools the pupils normally give half a day to classwork and half a day to shop or field work, while in the 1- or 2-year schools most of the time is given to practical work and technical subjects.

Agricultural schools. The principal aim of agricultural education and agricultural schools is to encourage and train youths, and urban youths in particular, to settle on the land. The 'Return to the Land' motto has been one of the great ideals of Jewish education for the last three generations. The scope for hired agricultural labour in Israel is very limited because most of the settlements are either communal or co-operative, or based on small farms worked by the settler and his family. The main aim of agricultural education is therefore to train skilled members of such settlements and also instructors for new settlers, and for this purpose the 3-year school is sufficient. An increasing number of youths wish, however, to go on to the faculty of agriculture of the Hebrew University, and for this purpose the 4-year school has been evolved so that the fourth year pupils sit for the special agricultural Bagrût examination for admission to that faculty. There are some 2-year schools for more restricted specialization, such as horticulture. There is also a 3-year school of fishery.

Recruitment of pupils is sometimes made on the result of the advice of vocational guidance agencies, and otherwise on the results of the parents' wishes, or the youth's own inclination, or as a result of the campaign made in grade 8 on behalf of agricultural education.

TIME-TABLE FOR AGRICULTURAL SCHOOLS (4-YEAR COURSE)

(in periods per week. This instruction takes half a day; the other half is devoted to various kinds of farm work)

Domestic science and vocational schools for girls. The aim of domestic science and vocational education for girls is to train them for life on the land in settlements, for home crafts and industries, for work in shops and factories, and as instructors to new settlers. There are a number of 2- and 3-year schools, and also 3- and 4-year schools at the end of which some of the girls may take the general Bagrût

examination. The programme in a 3-year domestic science school is shown in the accompanying table. The vocational schools give courses in sewing, embroidery, weaving, carpet-making, metalwork, applied art, hairdressing, etc. Commercial subjects are also offered in some schools.

Technical and industrial schools. More than 80 per cent of the pupils attend 3- or 4-year schools, and less than 20 per cent attend 1- or 2-year schools. Most schools teach a number of related trades. The most popular are metalwork (fitting, lathework, smithing), electricity (including radio and electronics), mechanical trades, woodwork, ceramics, etc.

The pupils are sometimes selected on the advice of vocational guidance centres and the like, but mostly they are recruited from among youth who, either on economic grounds or because of their experience in the primary school, have come to the conclusion that they should not try the general secondary school.

The following table shows subjects and time-allotments in a 4-year course for automotive mechanics.

The practical teaching in the workshops is as a rule done by means of job sheets and blueprints which allow the pupil to prove his individual ability and work at his own pace.

Nurses' schools. Nurses' schools accept girls with 10 years' schooling for 3 years, and thus their first 2 years are within the secondary education stage. These schools are attached to hospitals and are under the Ministry of Health. The girls receive theoretical and practical teaching and training from the start. There are shorter courses in practical nursing for boys and girls who have finished primary school.

Out-of-class activities

The degree of participation of pupils in school government and social life varies with the individual school. In some, particularly those in the labour settlements, it is more developed than in others. The same applies to social life: in most schools the pupils meet outside school hours and often have social evenings, etc. School cultural clubs exist in a number of schools, for subjects taught in school, e.g., biology, physics, literature, the Bible, etc., or for other subjects such as music, painting, etc.

There are numerous youth movements, such as scouting, which absorb the interest and spare time of many secondary school boys and girls who act as leaders for their juniors in the primary schools or in the lower secondary classes. An important movement started some years ago and called 'Youth for Youth' is composed of secondary school pupils who devote a few afternoons or evenings a week to visiting poor quarters or settlements. They organize games and entertainments for underprivileged children or help them to prepare lessons, to understand school work, to learn the language, to learn health and hygiene principles, etc.

TRENDS AND PROBLEMS

Apart from some specific difficulties mentioned above, there are a number of more general problems in secondary education.

The need is keenly felt of a general law of education which would lay down the stages of schooling and the division between primary and post-primary education. Such a law would contribute to a better integration of secondary education and to its more rational distribution according to the need and ability of the pupils. It would be desirable for such law to extend compulsory education to

the beginning of age 15, so that after the 6-year system of secondary education has been introduced it can be divided into two cycles and the lower 3 years added to compulsory education.

More attention is now naturally given to students who are below average. More should be done for gifted children by way of free education and grants to their parents, if necessary, until they complete their secondary education.

More should be known about the requirements of manpower over a number of years in advance, so that students may be more effectively advised in their choice of the various kinds of secondary education and so that the geographic distribution of schools may be planned more adequately.

There is a great need of adequate budgets for building and equipment and of proper development funds to meet the requirements of both old and new schools. The establishment of boarding facilities in some central schools is highly desirable, as well as the provision of gymnasiums and reading and recreation rooms.

Ways and means have to be found for attracting gifted young persons, properly trained, to the teaching profession. Proper arrangements for in-service training are desirable.

More attention must be paid to the planning of, and personnel responsible for, extra-curricular activities in secondary education. Special emphasis ought to be given to such activities during vacations. The aims and methods of art education in extra-curricular activities need to be clarified.

There is need for a systematic following up of the way in which the official syllabus is carried out, so that *ad hoc* changes may be made as required and more fundamental changes after some years of experience.

The Ministry of Education and Culture, in co-operation with the Hebrew University, has begun a process of checking on the humanities and science branches of the academic secondary schools. The quantitative aspect of teaching has often been criticized, and should be adapted to modern requirements. A better correlation between the various subjects in both branches should be aimed at and this should be done in co-operation with the teachers themselves. Agricultural and vocational education should be planned in co-operation with the leaders of industry. Considerable thought should be given to the problem of how theoretical and practical subjects can be made interdependent.

In teaching, the method of individual work and preparation by the pupils should be stressed and teachers should be trained accordingly. Textbooks should be written with this in view.

Experience has shown that 4 years is insufficient to cover adequately the required curriculum in the evening secondary schools and their course should consequently be extended to 5 years.

A thorough revision of examination requirements has lately been undertaken, as regards content, form and evaluation. One of the important improvements which have lately been introduced is to exempt a student from examination in one subject if he submits a paper prepared by him on that subject and approved by the supervisor. It is also proposed to exempt from examination in one subject pupils from certain schools in recognition of the educational level and achievements of these schools. This should greatly help schools doing experimental and research work.

Co-operation with parents is developing on approved lines. New impetus should be given to this co-operation by holding special seminars for the parents of children attending the same classes. An educational publication in which parents took part would be of great help in this connexion.

A special agency for planning educational research and its application should be set up and should publish the results for the public at large.

STATISTICS

Population (mid-year 1958 estimate): 1,997,000.
Area: 7,992 square miles; 20,700 square kilometres.
Population density: 250 per square mile; 96 per square kilometre.

Summary of school statistics, 1953–57. In 1957/58, total enrolment (not including adult education courses and schools for working youth) reached nearly 480,000 pupils, representing about one-fourth of the total population. Of these pupils, 16 per cent were enrolled in kindergartens, 72 per cent in primary schools, 8 per cent in secondary and vocational schools, and 3 per cent in higher education. The proportion of girls was 46 per cent in primary schools, 53 per cent in secondary schools, 29 per cent in vocational schools, and 86 per cent in teacher training colleges. The average number of pupils per teacher in primary schools was 24, counting both full-time and part-time teachers; this ratio was 10 in secondary schools and 12 in vocational schools. Between 1953 and 1957, primary school enrolment increased by 43 per cent; secondary general education by 25 per cent; vocational education by 61 per cent; teacher training by 53 per cent; other types of higher education by 59 per cent. The number of pupils receiving special education more than doubled in the same period. (See Table 2.)

Enrolment trends in secondary education, 1930–57. Figures shown in Table 3 are not comparable between the period 1930–46, which refers to Jewish education in Palestine, and the period since 1947, referring to Hebrew and Arab education in the State of Israel. As a result of rapid expansion between 1947 and 1957 the average total enrolment for the period 1955–57 was more than three times that for 1947–49. For the more recent period, the average total enrolment represented about 25 per cent of the estimated population 15–19 years old.

Examination results in secondary education, 1954–57. From 1954 to 1957, the annual numbers of persons who passed the Special Matriculation Examination were as follows: (1954/55) 2,558; (1955/56) 2,819; (1956/57) 2,981; (1957/58) 2,758.

Educational finance, 1957/58. For the year 1957/58, total recurring expenditure of the Central Government for education amounted to 73 million Israeli pounds, being an average of 37 pounds per inhabitant. (See Table 1.)

Source. Israel: Central Bureau of Statistics, reply to Unesco questionnaire.

1. EDUCATIONAL FINANCE, 1957/58 (in Israeli pounds)[1]

ITALY

THE EDUCATIONAL SYSTEM

The fundamental principles which underly the Italian educational system are defined in Articles 9, 33, 34, 117 and 118 of the Constitution of the Italian Republic. The main purpose of these principles is to promote the free development of the child's personality and to guarantee freedom of education subject to respect for the law.

Schools are open to all, without distinction as to sex, race or religion, and education is compulsory and free of charge for all children up to the age of 14 years. The rights of linguistic minorities are protected by the establishment of special schools where members of these minorities are taught their mother tongue in addition to Italian.

'Private groups and individuals have the right to establish schools and educational institutes without state support.' The State ensures to private schools which meet the requirements prescribed by the law, equality in studies, complete freedom of teaching, and scholastic treatment equivalent to that of pupils of state schools by means of state examinations on the termination of the various study cycles.

The Ministry of Education, which traces its origin to the office of the Royal Secretary of State for Public Instruction, established in 1847 in the Kingdom of Sardinia, is responsible for the administration, co-ordination and supervision of all activities of which education, culture and the arts are the ultimate purpose. The Ministry is responsible, among its other functions, for the moral and physical instruction and the school welfare of the children and youth of the country by establishing schools of all types and at all levels; it is also responsible for the supervision of private schools and the provision of educational assistance by the granting of scholarships, prizes and accommodation free of charge in boarding-schools to poor and deserving pupils.

In the provinces school administration is carried out by the *provveditorati agli studi* (offices of the provincial superintendents of education which exist in all provincial capitals). Each of these offices is headed by a *provveditore agli studi* (provincial superintendent), who is subordinate to the Ministry of Education; he supervises secondary education throughout the province, ensures the application of the laws and regulations, co-ordinates the various measures and provisions adopted with a view to increasing the efficiency of teaching, appoints all temporary teachers with the exception of technical school teachers in charge of technical subjects, peruses reports on the administration of school funds, authorizes the acceptance of gifts and bequests to these funds, appoints boards of examiners for school entrance and leaving examinations, sends *commissari* (inspectors) to private schools for the *scrutini* (awarding of marks for the year's work) and the examinations. He also supervises the careers of teachers in so far as he attends to the matter of salary increments, inflicts disciplinary sanctions, keeps the teachers' register up to date, etc.

The local, communal and provincial authorities do not exercise any control over state schools, but facilitate their operation by providing premises, furnishings, secretarial and general service staff, electric power, water supply, etc.; they may, however, manage officially recognized or private schools.

The following bodies, also, carry out specific activities in secondary education: Consorzi Provinciali per l'Istruzione Tecnica (Provincial Unions for Technical Education), the Ente Nazionale per l'Educazione Marinara (National Organization for Maritime Education) and Centri Didattici Nazionali (National Teaching Centres).

The purpose of the provincial unions for technical education, established by Act No. 7 of 7 January 1929 and reorganized by Royal Legislative Decree No. 1946 of 26 September 1935, is to promote the development and improvement of technical education within each province. With this in view the unions take, support and co-ordinate measures for the establishment of institutes, schools and free courses; they suggest the steps to be taken having regard to local economic needs, and make proposals concerning the revision, co-ordination and adaptation of the curricula so that they will correspond to local economic requirements.

The National Organization for Maritime Education administers the vocational schools which train staff for the lower grades of the mercantile marine and specialized staff for enrolment in the *corpo degli equipaggi marittimi* (state naval forces).

The National Teaching Centres are bodies established by Act No. 1545 of 30 January 1942, to carry out studies, research and teaching experiments under the supervision of the Ministry of Education, but each operates independently under the direction of a council. Each centre concerns itself with questions relating to a particular branch of school organization (pre-primary, primary, lower general secondary, classical, technical and vocational), or with such general questions inherent in educational activities as physical instruction, relations between the school and the pupils' parents, study and documentation. The activities of these centres usually take the form of seminars and in-service training courses for teachers, experimental classes, the application of new methods, the provision of educational documentation and information.

The National Teaching Centres already established and in operation are situated in Florence, Brescia and Rome.

The oldest-established of these centres is the Research and Documentation Centre in Florence, which controls the Biblioteca Pedagogica Nazionale (National Educational Library) and the Museo Nazionale della Scuola (National School Museum).

A committee, presided over by the Minister of Education and consisting of three members, is responsible for co-ordinating and controlling the activities of the National Teaching Centres.

Lastly, Article 117 of the Italian Constitution empowers the regions to promulgate legislation with regard to vocational and artisan instruction, and the constitutions of the autonomous regions give them wide powers in matters of public education. The administrations of the four regions already constituted as autonomous bodies (Sicily, Sardinia, Val d'Aosta and Trentino-Alto Adige) have already exercised such powers and promulgated regulations on vocational education.

The structure of the Italian school system is shown in the diagram on page 715.

THE DEVELOPMENT OF SECONDARY EDUCATION

The first modern school regulations in Italy can be traced back to 1859, when the State of Piedmont was faced with the task of educating the young.

Under the Casati Law, so-called after the Minister who studied and prepared the reforms, the entire educational system was organized in three branches: higher education, secondary classical education, and thirdly, technical and primary education. The third branch also comprised the teacher training schools, which were reorganized in 1896.

Secondary classical education was intended to give pupils the necessary instruction in literature and philosophy so as to qualify them for admission to the university, and was divided into two successive stages: the *ginnasio* and the *liceo*. At the *ginnasio* the course lasted 5 years and at the *liceo* 3 years. Subsequently, the *ginnasio* was divided into the lower *ginnasio* with a 3-year course and the upper with a 2-year course.

Technical instruction was intended to provide pupils with both general and special education which would fit them for certain branches of the public service, industry, commerce and management in agriculture. Technical education, also, was in two stages: lower (technical schools with a 3-year course) and upper (technical institutes with, firstly, a 3-year, and, subsequently, a 4-year course).

At the technical institutes, which comprised special sections (accountancy, physics and mathematics, land-surveying, nautical science and industry), vocational training was provided in addition to a general education.

The task of the teacher training schools where the course lasted 3 years was to train primary school teachers. A complementary school (*scuola complementare*), with a 3-year course, a kindergarten (*giardino d'infanzia*) and a complete course of elementary classes for apprenticeship training were successively attached to the teacher training schools.

This law was later extended to the other three regions when they became part of the Kingdom.

Subsequently, the curricula and time-tables for every type of school and institute were fixed; the provisions concerning the *scrutini* and the examinations were amended from time to time, but the structure of the educational system as established by the Casati Law was to remain unchanged until 1923.

This educational system was criticized on the ground that the teaching given was of an excessively piecemeal nature and placed the main stress on the training of the pupil's memory; it was consequently dull and seemed to have no other object than to teach pupils a limited number of ideas, without taking any interest in their general intellectual training.

In 1923, the educational system was reformed by Gentile, then Minister of Education. The reform proposed was far-reaching, affecting both the organization and the content of schooling. It was designed mainly to place less emphasis on memorization of facts and more on the process of reasoning from knowledge acquired.

The system of annual promotion on the basis of the pupil's average school marks was replaced by a system which endeavoured to test the pupil's intellectual maturity, by means of a state examination at the end of every study cycle. The structure of the *ginnasio* and the *liceo* remained unchanged. The teacher training schools were replaced by the teacher training institute (*istituto magistrale*), lower and upper.

The structure of the technical institute was completely transformed; the 3-year technical school course was abolished and a lower 4-year course of a general humanistic nature, common to all types of technical institutes, was introduced. Studies at the technical institutes were divided into two cycles of 2 years each; the first continued and completed the general educational preparation acquired in the lower course mentioned above, and the second was devoted exclusively to vocational training.

Lastly, a new type of school was established: the *liceo scientifico* (upper general secondary school, the curriculum including mathematics and the sciences), which provided training for pupils intending to study at a faculty of science.

Parallel with these institutions, towards the end of the nineteenth century and at the beginning of the twentieth century, commercial, agricultural and industrial schools and institutions were set up by private persons here and there wherever economic conditions rendered them necessary; they were designed exclusively to train managing staff and specialized workers for local industries.

These schools were placed under the supervision of the competent ministries, and the curricula and time-tables varied according to economic requirements, until in 1923 they were all reorganized on a common basis.

In 1928, they came under the control of the Ministry of Education and, in 1931, were reorganized on their present basis as technical schools and technical institutes.

Almost at the same time, the *scuole complementari* (complementary schools) the *scuole tecniche* (technical schools) and the *scuole di avviamento al lavoro* (pre-vocational training schools), provided for under previous legislation were reorganized by Act No. 490 of 22 April 1932 as *scuole secondarie di avviamento professionale* (general secondary pre-vocational training schools) and entrusted with the task of providing compulsory post-primary education for pupils up to the age of 14 years as well as preparatory training for the various trades, for practical agricultural work and for executive posts.

These schools, also, still maintain the form which they were given by the above-mentioned Act.

The existence, however, of lower courses which varied from one type of school to another obliged pupils to make a premature choice when they had hardly left elementary school.

In order to obviate these inconveniences, the lower

courses of the technical institute, the teacher training institute and the *ginnasio* were unified by Act No. 899 of 1 July 1940 in the *scuola media* (lower general secondary school).

This school by giving its pupils a grounding in the humanities as well as practical training, tests their inclinations and develops their abilities; in co-operation with their parents, it helps them to choose their future careers for which it gives them the necessary preparation.

Legal basis

The following are some of the principal laws and decrees relating to secondary education:

Royal Decree No. 1054 of 6 May 1923, concerning the organization of secondary education and national boarding schools.

Royal Decree No. 965 of 30 April 1924, relating to the internal organization of the committees and Royal Institutes of Secondary Education.

Act No. 899 of 15 June 1931 to reorganize secondary technical education.

Act No. 490 of 22 April 1932, to convert Royal Legislative Decree of 6 October 1930, concerning the *scuola secondaria di avviamento al lavoro* (secondary pre-vocational training school), into in Act.

Royal Decree Law No. 1946 of 26 September 1935, to reorganize the *Consorzi Provinciali per l'Istruzione Tecnica* (Provincial Unions for Technical Education).

Royal Legislative Decree No. 2038 of 21 September 1938, relating to the establishment and abolition of technical institutes, and their conversion into state establishments.

Act No. 899 of 1 July 1940, concerning the establishment of the *scuola media* (lower general secondary school).

The Vice-Regent's Legislative Decree No. 816 of 7 September 1945, to modify the organization of the *scuola media*, to establish classes linking up with the *liceo scientifico*, the *istituto magistrale* (teacher training institute) and the technical institutes, and to make provision for the managing and teaching staff.

Legislative Decree No. 690 of the Provisional Head of the State dated 20 May 1947, providing for the promotion of technical education.

Legislative Decree No. 1277 of the Provisional Head of the State, dated 7 May 1948, to revise the legal and financial status of the technical staff of technical schools and institutes.

Legislative Decree No. 1278 of Provisional Head of the State dated 7 May 1948, to revise the legal and financial status of the technical staff of the *scuole secondarie di avviamento professionale* (lower secondary pre-vocational training schools).

GLOSSARY

conservatorio di musica e liceo musicale: vocational training school of music.

ginnasio e liceo classico: upper general secondary school with curriculum emphasizing literary studies and including Greek; course comprises lower stage (*ginnasio*) and upper stage (*liceo classico*).

istituto d'arte: vocational training school of art with course for training specialist teachers (*magistero*).

istituto magistrale: teacher training school.

istituto tecnico agrario: vocational secondary school of agriculture.

istituto tecnico commerciale e per geometri: vocational secondary school of commerce and surveying.

istituto tecnico industriale: vocational secondary school of industry, often specializing in one field of study (mining, textiles, metallurgy, etc.).

istituto tecnico nautico: vocational secondary school of nautical studies (navigation, marine engineering and shipbuilding).

liceo artistico: upper general secondary school with curriculum emphasizing fine arts.

liceo scientifico: upper general secondary school with curriculum emphasizing mathematics and sciences and including a modern language.

magistero: see *istituto d'arte.*

scuola d'arte: vocational training school of art.

scuola di avviamento professionale: pre-vocational training school.

scuola di magistero professionale (femminile): specialized teacher-training school for teachers in vocational schools for girls.

scuola elementare: primary school.

scuola materna (del grado preparatorio): pre-primary school.

scuola media: lower general secondary school.

scuola professionale femminile: vocational training school for girls.

scuola tecnica agraria: vocational training school of agriculture.

scuola tecnica commerciale: vocational training school of commerce.

scuola tecnica industriale: vocational training school of industry.

Ministerial Decree of 1 December 1952, relating to school time-tables and duties.

Act No. 645 of 9 August 1954, containing extraordinary provisions to encourage school building as well as the new rates of fees for secondary schools (lower, classical, scientific, teacher training and technical) and provisions relating to exemption from the payment of such fees and the institution of scholarships.

Act No. 1440 of 15 December 1955, to lay down new rules for state qualifying examinations for the lower secondary school teachers.

Decree No. 537 of the President of the Republic dated 12 June 1955, concerning the classification and transformation of schools of art in accordance with Act No. 651 of 9 August 1954.

Decree No. 766 of the President of the Republic, dated 30 June 1956, relating to administrative decentralization.

Act No. 782 of 8 July 1956, to transform the *scuola di magistero professionale per la donna* (girls' vocational teacher training school) and the annexed girls' vocational training schools into *istituti tecnici femminili* (girls' technical institutes).

Decree No. 3 of the President of the Republic dated 10 January 1957, containing the codified text of the provisions concerning the status of state employees.

Act No. 88 of 7 February 1958, relating to physical education.

Act No. 165 of 13 March 1958, concerning the careers and salaries of the managing and teaching staff of primary and secondary schools and schools of art, and concerning the careers of school inspectors of the Ministry of Education.

Act No. 184 of 6 March 1958, relating to the *scrutini* (awarding of marks for the year's work) and examinations at secondary schools and schools of art.

Administration

As already indicated the administration, co-ordination and supervision of schools fall within the competence of the Ministry of Education which, within the general framework of the Italian Administration, is an organ of the State exercising the functions assigned to it by the law through general directorates as well as through inspectorates and other services, each of which is placed in charge of a particular school sector.

The responsibility for the administration and supervision of secondary schools is distributed among the following directorates-general and inspectorates: (a) Inspectorates for lower secondary education, with respect to the administration and operation of the *scuole medie* (lower general secondary schools) and the *scuole secondarie di avviamento professionale* (general secondary pre-vocational training schools); (b) Inspectorate for the teaching of art, with respect to the administration and operation of secondary schools of art; (c) Directorate-General of classical and scientific education and teacher training, with respect to schools providing a humanistic education and institutes for the training of primary school teachers; (d) Directorate-General of technical education, with respect to technical and vocational schools of the first and second cycles; (e) Inspectorate for private lower secondary schools, which exercises supervision and disciplinary control over all private schools governed by Act No. 86 of 19 January 1942.

The Higher Council of Public Education, consisting of 60 members in addition to its chairman (the Minister of Education), is the advisory body. It comprises three sections; one for university education, one for secondary education and one for primary education. The section for secondary education not only gives advice on all questions concerning this branch of education, but hears appeals against transfers, establishes the procedure for disciplining or dismissing heads and teachers of state secondary schools and institutes as well the procedure for disciplining heads and teachers of recognized secondary schools and institutes. This section also comprises a committee of three members, which advises on the transfer, owing to the necessities of the service, of heads and teachers of secondary state schools and institutes.

The organization of general school education, the duration of the courses, the time-tables and curricula are normally established by a decree of the President of the Republic or by a legislative decree prepared by the Minister of Education.

There are no regulations concerning the choice of teaching methods, which are left entirely to the teacher's discretion; but, thanks to the activities of the Ministry of Education's inspectors, the work of the teaching centres and the organization of in-service training courses for teachers, more modern teaching methods are disseminated among the latter. The choice of textbooks is left to the teachers' board of each school or institute.

Control. State schools are administered by the State as public institutions and each of them possesses the following officials and organs responsible for its operation: the head (*preside* or *direttore*), the school board (*consiglio di presidenza*), the teachers' board (*collegio dei professori*) and the class committee (*consiglio di classe*).

The head is responsible for the efficient conduct of the school, from the teaching, educational and administrative standpoints; ensures the application of the relevant legal rules and regulations; corresponds with the Ministry of Education through the provincial superintendent; remains in contact with the pupils' parents and sees that the teachers perform their duties scrupulously.

The school board acts as an advisory body to the school head. In addition to the latter, who is its chairman, it consists of from two to four teachers elected at the beginning of the school year by the teachers' board. The latter, which is composed of all the teachers on the school's staff, takes all important decisions with regard to the conduct of the school. This board deals not only with all the questions entrusted to it by the laws and regulations but also with all matters concerning the school's general, educational or disciplinary policy.

The teachers' board also chooses textbooks, decides whether the most serious disciplinary measures should be taken against pupils, etc. At the beginning of the school year, it also decides upon the general trend to be given to the school's teaching and educational policy.

The class committee is composed of all the teachers who teach in each class. It is responsible for ensuring the co-ordination of the curricula of the various subjects; at the

end of each term, and at the time of the final *scrutinio*, it appraises each pupil's conduct and progress; it adopts certain disciplinary measures against pupils, decides whether new pupils may be enrolled in the class during the school year, etc.

Financially independent technical institutions have a board of administration, appointed by the Ministry of Education and composed of a chairman, the head of the school or institute concerned, who acts as its secretary, and representatives of the local authorities, of the Ministry of Education and of all other bodies or persons making an important contribution to the maintenance of such schools.

The board of administration is responsible for administering the resources of the school as well as contributions from the Ministry of Education. It therefore makes decisions concerning the purchase and sale of material, the granting of special allowances to staff members, the acceptance of bequests, gifts, etc., and directly appoints the regular and temporary teachers of technical subjects.

Supervision and inspection. The Ministry of Education exercises two kinds of supervision over schools: administrative control over the general conduct of the institutions in order to ensure that the funds allocated to them are properly administered and that all the relevant laws and regulations are observed; and a technical-didactic supervision of the teaching staff.

Officials attached to the regional offices are responsible for the administrative control; the technical-didactic supervision, on the other hand, is carried out by central inspectors, who are appointed subject to a competitive examination of their qualifications from among school heads and teachers and high officials of the Ministry of Education of considerable seniority in the service.

In addition to their supervisory functions, all inspectors, both technical and administrative, carry out inquiries and research into school organization, from the teaching and legislative standpoints.

There are no legislative provisions concerning the supervision of school education by private bodies, such as parents' committees. Relations between parents and schools are left entirely to the discretion and understanding of the school heads who, through meetings and publications, endeavour to interest parents in the school and its problems, emphasizing all school and out-of-school activities undertaken with a view to improving the pupils' civic mindedness and cultural development.

Finance. School expenditure is financed partly by the Ministry of Education and partly by the local, communal and provincial authorities.

The following expenses are borne by the Ministry: salaries of teachers of all types of schools, cost of the equipment and of the material necessary for practical work in the *scuole medie* and the *scuole secondarie di avviamento professionale*, expenditure for the purchase of technical, scientific and teaching material and publications.

The Ministry also makes contributions and grants with a view to promoting all activities likely to improve the efficiency of school teaching.

The following procedure is followed for the financing of schools and institutes: direct orders for payment are sent in the case of technical schools and institutes which are corporate bodies enjoying administrative independence (industrial, agricultural, nautical and girls' technical institutes; technical schools of all kinds; vocational training schools, girls' teacher training schools, and the recently established commercial and surveyors' technical institutes), and credit accounts are opened in the case of all other schools which are not administratively independent (*scuole secondarie di avviamento professionale*, *scuole medie*, classical and scientific lyceums, teacher training institutes and most of the commercial and surveyors' technical institutes).

On the other hand, the expenses relating to the provision of premises and furnishings, heating, lighting, water supply and electricity, and the salaries of the secretarial and general service staff are borne by the communal or provincial authorities according to the type of school. The communes are responsible for the costs of the *scuole medie*, the *licei*, teacher training institutes, nautical institutes, *scuole secondarie di avviamento professionale* and technical schools of all kinds and the provinces for those of the scientific *licei* and technical institutes. The provinces must also provide agricultural schools with the farms necessary for practical work.

At present, under Act No. 645 of 9 August 1954, the State is providing an annual sum of 1,500,000,000 lire, for the years 1955–64, in order to help the local authorities to defray the expenditure for the construction, completion, extension, repairing and main furnishings of the *scuole di avviamento*.

As already indicated, teachers' salaries are paid entirely from the Ministry of Education's budget, of which they constitute the most important item. In fact, it may be maintained that three-quarters of the budgetary appropriation for education are used for the remuneration of teachers. In addition to their salaries, calculated in accordance with coefficients based on length of service, teachers receive allowances and fees for examination work, as well as a special allowance 'for additional teaching services', instituted by Act No. 165 of 13 March 1958.

Pupils attending schools are required to pay the following fees: for the first enrolment (*immatriculazione*) at a particular type of school; for attendance; for examinations; for diploma. The amount of the school fees is fixed by Act No. 645 of 9 August 1954. The *scuola secondaria di avviamento professionale* is free of charge.

In addition to school fees, pupils must pay a contribution for school reports, for insurance against accidents during physical instruction lessons, and for the various school welfare services. Pupils of technical schools and institutes must also pay contributions for the use of material during practical work.

The first concrete form of school aid to parents of needy pupils is the exemption of the latter from the payment of school fees; this exemption is gradually being extended to other categories of pupils.

This exemption is total or partial and is accorded on the basis of merit or because of the particular situation of the pupil or of his parents. In fact, in addition to pupils who obtain high marks for their progress or conduct, the following are exempted from the payment of school fees: persons disabled by the war or as a consequence of the war,

state service or their employment; their children; orphans of persons who died on the field of battle or as a consequence of the war, state service or their employment; children of those missing as a consequence of the war; children of large families; children of Italian citizens residing abroad; foreign students.

In addition to the exemption from the payment of school fees, deserving pupils in straitened circumstances can be accommodated free of charge in national boarding-schools until the end of their secondary education.

Scholarships, prizes, grants, etc. constitute another form of school assistance. Apart from the considerable number of scholarships which are granted by private persons or by bodies other than state organizations and which are limited, being restricted to pupils of a particular category or country, mention may be made of the scholarships instituted by Legislative Decree No. 690 of 29 May 1947 of the Provisional Head of the State for the benefit of pupils of the technical schools attached to the Provincial Unions for Technical Education; the scholarships established by Act No. 645 of 9 August 1954 to the amount of 500,000,000 liras; and, lastly, the scholarships awarded to the orphans of those who were killed in the war or as a consequence of the war or during the struggle for the liberation of the country, which amount to 100,000,000 liras (Act No. 402 of 3 May 1956).

Finally, the most direct form of assistance, designed to meet the pupils' most urgent needs, is given by the School Fund (*Cassa scolastica*), established, in every school, in accordance with Article 101 of Royal Decree No. 965 of 30 April 1924, by a grant of funds.

Buildings and equipment. Although, as already indicated, the local authorities are exclusively responsible for providing premises, the plans of school buildings must, before being executed be sent to the Ministry of Education's Central Service for the Building and Equipment of Schools, which is responsible for ascertaining whether the plans satisfy the standards established for school buildings.

In accordance with these standards, the school building must be erected preferably on an open site, so that it will possess a large area of free space and receive light and sun on all sides; the soil must be dry and not liable to cave in and must meet hygienic requirements in every way. In addition to a certain number of classrooms for technical and cultural lessons—the number of such rooms being proportionate to the number of pupils—every school building must have laboratories for the teaching of scientific subjects (physics and chemistry), specially equipped for experimental work by the pupils and provided with a work-room and study for the teachers; a large hall for meetings, lectures, concerts, etc.; a gymnasium for physical instruction; a teachers' room; offices for the secretarial staff and for the school head and school board, and a number of rooms for hygienic and sanitary purposes, e.g. a dressing-room, showers, etc.

Technical and vocational training schools must also be provided with suitable rooms for practical work. When productive enterprises are attached to these schools, the school buildings must be planned and constructed in such a way that the design is dictated by the nature of the working environment. Special criteria are prescribed for the construction, situation and lighting of such premises, according to the particular purpose for which they are designed. Each classroom must be large enough to accommodate some thirty pupils. Each pupil is entitled to 16 square feet and from 176½ to 353 cubic feet of space, according to his age, while the proportion between the width and length must be such that the former represents two-thirds of the latter.

Each classroom must be adequately ventilated and lighted, and heated internally so that the temperature never falls below 15 °C. and never exceeds 18 °C.

School welfare services. There are still no special legal provisions concerning health assistance for pupils. Nevertheless, for some time now, school heads most alive to modern social and pedagogical ideas have emphasized the need for a scientific approach to the physical and psychical problems confronting children before and at the age of puberty by means of co-operation between the schools and the medical profession.

On the basis of certain legal provisions relating to the observance of the most elementary hygienic rules and the prevention of infectious diseases in schools, these school heads have recruited the services of school medical advisers who, in addition to their normal duties—medical supervision, preventive treatment and first aid—also perform other tasks, which may be summed up as follows: a periodical medical examination; a report to parents on any abnormalities observed in the child's state of health; a report to teachers on any deficiencies noted in the child, so that they will possess the necessary knowledge for an appraisal of the child's personality and capacity to learn.

As this measure corresponds to an urgently felt need, it may reasonably be anticipated that it will be continued and that an appropriate organization will be set up by law.

Health assistance for teachers is provided by the Ente Nazionale per l'Assistenza al Personale Statale (ENPAS) (National Welfare Organization for State Employees), which looks after the welfare of all state officials and employees, and by the Istituto Kirner, a body corporate under public law, which looks after the welfare of the managing and teaching staff of all secondary schools.

TYPES OF SECONDARY EDUCATION

Secondary education comprises two main cycles.

The first cycle, which is for children between the ages of 10 and 13 years and covers two main types of school comprises (a) *scuola media* (lower secondary school), of which there is only one kind; and (b) *scuola secondaria di avviamento professionale* (lower secondary pre-vocational training school), of which there are various kinds—commercial, agricultural, industrial, nautical and girls' industrial schools.

There are also a number of technical schools which conclude this cycle; their task is to enable pupils who do not intend to enter higher educational establishments to specialize in a particular trade or profession. These schools include (a) technical schools (agricultural, commercial, nautical), providing a 2-year course; (b) various vocational training institutes (agricultural, commercial,

industrial, nautical)—the length of the course varies according to the specialization; (c) girls' vocational training schools.

The second cycle, which is for young persons between the ages of 14 and 18 years. The schools of this cycle are divided according to their purpose and the nature of the instruction given, into academic schools, where instruction is predominantly in the humanities, and technical schools.

The academic schools include the *liceo classico* (upper secondary schools with predominantly classical instruction), with a 5-year course, the *liceo scientifico* (upper secondary schools with predominantly scientific instruction), also with a 5-year course, and the *istituto magistrale* (teacher training institute), with a 4-year course.

The technical schools are as follows. Firstly the *istituti tecnici* (technical institutes), with various sections (agricultural, industrial, commercial, surveying, nautical, girls'), each section containing a number of sub-sections corresponding to different branches of specialized training; the technical institute's course lasts 5 years. Secondly the *scuole di magistero professionale per la donna* (girls' vocational teacher training schools) which provide a 2-year course.

Thus, children who have completed their primary education can choose between two types of schools where, up to the age of 14, they can conclude the period of compulsory education prescribed by the law: the *scuole secondarie di avviamento professionale* (providing a 3-year course), and the *scuole medie* (also providing a 3-year course). The *scuola di avviamento* is open to pupils who obtain the primary school leaving certificate (*licenza elementare*) at the end of the 5-year primary course, whereas those wishing to enter the *scuola media* must pass a special entrance examination.

The pupil's choice between the two types of schools depends on his parents' wishes and not on examinations designed to ascertain his aptitudes. Special vocational guidance centres were recently set up by the Provincial Unions for Technical Education, but they are concerned mainly with the child's physical possibilities. Their opinions are not regarded as binding, both owing to the respect due to the human personality, and to the fact that it is well known that enthusiasm and will-power can outweigh initial disadvantages caused by physical defects.

Broadly, students who intend to continue their studies until they obtain a university degree, or at least a diploma of a higher educational establishment, enter the *scuola media*, whereas those who intend to limit their studies to lower secondary education and to obtain a diploma qualifying them for a particular trade enter the *scuola secondaria di avviamento professionale.*

After completing the first cycle of secondary education, pupils who have obtained the leaving certificate of the *scuola media* can continue their studies in the *liceo classico*, the *liceo scientifico* (both pre-university schools), the *istituto magistrale* (teacher training institute) or the *istituto tecnico* (technical institute).

Pupils who have obtained the leaving certificate of the general secondary pre-vocational training school *diploma di licenza della scuola secondaria di avviamento professionale* can continue their studies:

1. Without passing an entrance examination, in the vocational training institutes (providing a 3-year or 4-year course according to the subject chosen) or in the technical schools (2-year course).

   Pupils who obtain the technical school leaving certificate can, after passing an entrance examination, attend the second class of the corresponding technical institutes.

   On the other hand, girls wishing to complete their studies for girls' careers can enter the vocational training school (3-year course) and then the girls' vocational teacher training school.
2. After passing an entrance examination, in the technical institutes (industrial, agricultural or girls' institute) and in the mechanics sections of the technical institutes for nautical studies.

The school year extends from 1 October to 30 September. The opening and closing dates are fixed every year by an ordinance of the Minister of Education. Usually, the courses last from the beginning of October to the end of May. This period is divided into terms. The courses are followed by the *esame di ammissione* (entrance examination), the *esame di idoneità* (examination for promotion from one class to another), the *esame di maturità* (in many ways equivalent to a matriculation or university entrance examination) and the *esame di abilitazione* (examination for a diploma certifying that the student is qualified to perform certain work). These examinations take place during the months of June and July, and again in September for those failing to pass them the first time. In August, activity in the school is limited to the functioning of the school secretariat and to administrative work relating to the pupils. Thus, for pupils not required to sit for the examination, the long vacation lasts from June to October. There is also a week's vacation at Christmas.

General secondary schools

The *scuola media* (lower general secondary school) was established only recently, in 1940, as the result of the unification of three types of lower secondary schools: the lower 3-year courses of the *ginnasio*, the lower 4-year course of the teacher training institute and the lower 4-year course of the technical institute. These types of schools resembled one another to such a degree that it was quite easy for pupils to pass from one to another, i.e., quite easy under the law of which the purpose was to promote the most appropriate guidance of children between 10 and 14 years of age, but pupils hardly ever did so because the various courses gradually and almost automatically became specialized owing to their inclusion in the curricula of particular types of schools; thus, in fact, pupils of the lower *ginnasio* arrived prepared for instruction at the *liceo;* those following the lower course of the teacher training institute were trained for the upper course of the same institute, and, lastly, most of those of the lower technical institute were prepared for the commercial technical institute. This pre-established direction given to studies was in contradiction with the principles of the 1923 reform.

Thus, the *scuola media* emerged in 1940 from the fusion of the three above-mentioned types of lower secondary school as a preparation for higher secondary education.

As stated in the 1944 study plans, the reason for this was 'to avoid beginning prematurely the child's cultural specialization and to give a common basis to the general lower secondary education of all sections of the population, so that the child's specialization will depend on his own aptitudes and not on the situation of his family'.

The *scuola media* is open to pupils who have completed their primary education and pass the special entrance examination; it offers a 3-year course.

TIME-TABLE AND CURRICULA OF THE 'SCUOLA MEDIA'

Subject	Year of study		
	I	II	III
Religion	1	1	1
Italian, Latin, history, geography and civics	16	15	15
Mathematics	3	3	3
Foreign language	—	2	2
Drawing	2	2	2
Physical instruction	2	2	2
Domestic science for girls	2	2	2
Music and singing (optional)	1	1	1

On completing his studies at the *scuola media*, the pupil sits for a school-leaving examination (*esame di licenza*), which gives access to all types of higher secondary schools, including those providing technical instruction. The board of examiners, in addition to deciding whether the pupil's examination results are satisfactory, is also required to express an advisory opinion concerning the most appropriate orientation of the pupil's future studies.

This brief description of the *scuola media* may be concluded with a reference to the wide-scale reform of teaching and educational methods now being carried out in the form of experiments under the guidance of the Centro Didattico Nazionale per la Scuola Secondaria (National Teaching Centre for Secondary Education).

The *liceo classico* (upper general secondary school placing emphasis on instruction in the classics) is the school most deeply rooted in Italian traditions; it is the school that at one time almost exclusively trained the nation's ruling class, and still does so today to a considerable extent. The 1923 reform, while promoting the renewal of the methods and spirit of this school, did not alter its structure, which was solid. The complete course of studies—suitably inter-related—lasted 8 years. The school as a whole comprised the *ginnasio* (lower and upper) and the *liceo*, and was therefore known as the *liceo-ginnasio*. The 3-year course of the lower *ginnasio*, during which the pupil received a grounding in the humanities and began the study of Latin and other subjects, was followed by the 2-year course of the upper *ginnasio*, where the pupil began to learn Greek while continuing the study of Latin. During the 3-year course of the *liceo* properly so-called, the study of classical languages took the form of a study of classical letters (or literature). The pupil continued the study of Italian literature, history, geography and mathematics, already begun at the *ginnasio*, and to these were added philosophy, the history of art, physics and science. He thus acquired a rich fund of knowledge. 'The aim of classical education is to prepare the pupil for university and higher studies.' This was laid down in the 1923 Act and is still applicable. It means that classical education is not an end in itself, but a preparation for further studies, and gives access to all university faculties. There is one exception, the Faculta di Magistero (Faculty of Teaching), which is open to those who have attended a secondary teacher training school and received training for primary school teaching, subject to their passing a special entrance examination.

Following on the establishment of the *scuola media*, which, as already indicated, took place in 1940, the lower 3-year course of specialized training of the *liceo-ginnasio* was abolished and the latter now comprises two classes of the upper *ginnasio* and three classes of the *liceo*. Thus, the course now lasts 5 years; but, as it recruits its pupils among those who have completed the 3-year course of the *scuola media*, its own study plan remains unchanged.

During the first 2 years, which completely correspond to the former 2-year course of the upper *ginnasio*, pupils study Italian, Greek, history and geography, mathematics, a foreign language (French, English, German or Spanish) already begun at the *scuola media*, and physical instruction; the curricula also provide for religous instruction, from which pupils are exempted at their request. The class teacher, who gives instruction in a whole series of subjects (Italian, Latin, Greek, history and geography), ensures real uniformity of teaching at this school.

Except for the foreign language all these subjects continue to be taught during the 3-year course of the *liceo* proper, but they are taught in seperate classes and by different teachers (two of the latter share the task of teaching literature in the three classes), and the pupils also study philosophy, natural sciences and chemistry, physics and the history of art.

The reason for dropping the foreign language at the beginning of the 3-year *liceo* course, was the fear that it would place an undue burden on the pupils. This is unfortunate, and today the lack of such teaching is particularly felt.

The syllabuses drawn up in 1944 contain instructions for the teaching of the different subjects in each class but leave the teachers considerable discretion with regard to the direction to be followed, and consequently with regard to the choice of textbooks and reading matter.

For selection purposes an examination is held for those wishing to follow the course of the *liceo* proper after completing the 2-year course of the *ginnasio*. It is an entrance and not a leaving examination and the board of examiners therefore consists mainly of teachers of the *liceo*, i.e., teachers in charge of the course which pupils wish to follow. Thus, it is an examination by means of written and oral tests designed essentially to ascertain the pupil's aptitude for classical studies. At the end of the *liceo* course, the pupil sits for the *esame di maturità classica* (an examination equivalent to a university entrance examination, with emphasis on classical studies).

The 'national inquiry for the reform of school education', announced in 1947, showed that, with the exception of very slight modifications, it was not thought advisable nor was it recommended that any changes should be introduced into the organization of this type of school. Confirmation of this is to be found in the report on the

proposed reform: 'The *liceo classico* has its own particular structure which should not be altered; it is simply desired that the instruction given be of a more classical nature, so that its high tradition shall not become a mere memory but shall be maintained as a living reality.' The same report suggested that the classical *liceo* should continue to give access to all university faculties, that is, that it should keep its character of superior training for higher education.

The *liceo scientifico* (upper general secondary school with emphasis on science) was established by the 1923 reform. Long before that reform, however, there had been a tendency to modernize the study of the humanities. In 1911, for instance, modern sections had been attached to the *liceo-ginnasio* in various towns. The instructions concerning the curricula indicated that the object of these sections was to 'train the citizen, develop his moral character, strengthen and refine his physical and spiritual activities for the greater welfare of the nation and mankind. The purpose was not to achieve immediate practical and utilitarian aims and there was no direct reference to the profession and kind of activity which the pupil will choose subsequently'. The directives also contained the following definition: 'The modern *liceo-ginnasio* maintains a temperate but living contact with our classical and Italic traditions—a contact which absorbs less of the pupils' time than at the *liceo classico*, but on the other hand it takes full advantage of the languages and literature of other countries and a deeper knowledge of the sciences so as to open the minds of the young to the renovating and livelier ideals of the modern spirit.' These definitions are also applicable to the *liceo scientifico*. At the modern *liceo*—as later at the *liceo scientifico*—pupils continued the study of Latin (but no longer Greek), and also received instruction in modern languages with more time for scientific subjects. At the same time, however, scientific instruction was provided at another type of school, namely in the physics and mathematics sections of the technical institutes. After the abolition of the modern sections of the *licei* and the physics and mathematics sections of the technical institutes, the scientific *licei* were established in 1923.

The scientific *liceo* was organized on a 4-year basis and therefore lacked a lower preparatory course. It was voluntarily attended by pupils from the lower teacher training institutes, lower technical institutes and the four classes of the *ginnasio*. The diversified origins of the school population was a disadvantage for the *liceo scientifico*. The pupils required some time to adapt themselves and become a homogeneous group, and the teaching suffered thereby, at least during the first year.

According to the law establishing the scientific *liceo*, the object of the latter is 'to develop and render more thorough the studies of pupils who wish to continue their education at the university faculties of science, medicine or surgery, with special emphasis on scientific work'. Changes gradually introduced into the organization of university education offered ever wider possibilities to pupils from the scientific *liceo*, to such an extent that today they can even enrol at other faculties, such as the faculties of engineering, statistical and actuarial sciences, economic and commercial sciences, chemistry, pharmacy, architecture, etc.

As the normal preparation for the scientific *liceo* was given at the lower technical institute or at the lower teacher training institute (4-year course), the complete course of a pupil, from the beginning of his secondary studies until their conclusion at the scientific *liceo*, lasted 8 years. On the abolition of the two above-mentioned lower courses and their replacement by the *scuola media* (3-year course), the complete course would have been reduced by a year if a class had not been added to the *liceo* so as to organize it on a 5-year instead of on a 4-year basis. This was done in 1945, immediately after the war, by the institution of a connecting class (*classe di collegamento*) between the *scuola media* and the scientific *liceo*. It was included provisionally in the structure of the *liceo* pending an organic reform of the educational system. This class still possesses the characteristics of those of the lower courses for which it was substituted. Italian, Latin, history and geography are taught by one and the same teacher. Pupils continue their study of a foreign language, begun at the *scuola media;* they are also taught mathematics, drawing, religion, and physical training.

In the other classes, pupils are taught Italian and Latin literature, a foreign language, history and philosophy, mathematics and physics, the natural sciences, chemistry, geography, drawing and physical training. The curricula also include religious instruction, subject to exemption on request. A comparision with the classical *liceo* shows that, apart from the teaching of a foreign language instead of Greek and drawing instead of the history of art, there is practically no difference between the two *licei*. At the *liceo scientifico* less time is devoted to literary studies—authors and periods of lesser importance being dealt with synoptically—and more time to purely scientific studies.

Teaching methods and classification of pupils. As already mentioned, the choice of teaching methods is left entirely to the teacher who, on his own responsibility, uses what he considers to be the most appropriate instruments for teaching the pupils entrusted to him.

At the end of each term, teachers of the same class meet together in order to form an opinion on the school progress of each pupil. They award from 1 to 10 marks for every subject. In order to be promoted from one class to another, a pupil must obtain 6 marks for every subject and 8 marks for behaviour. Pupils failing to obtain the requisite number of marks are entitled to sit for examinations specially organized for them in the autumn. At the end of each study cycle, there is a state examination for the corresponding diploma. At the end of each school year, in addition to awarding marks, teachers draw up a short report on each pupil; this report forms part of the school's records, but it is not of a binding nature and does not determine the orientation of the pupil's future studies, the choice of which is left entirely to his parents.

Recruitment, career and training of teachers. In general, registered teachers (*professori di ruolo*) are recruited competitively, on the basis of qualifications and an examination, from among holders of a university degree (*laurea*). The qualifications show the extent of the candidate's cultural and scientific training, whereas the examination is designed to ascertain his aptitude for teaching.

The successful candidate, when appointed, is known as a *professore straordinario;* after a 2-year probationary period, during which he must show his aptitude for teaching, he is given the status of a *professore ordinario.* The teacher's career is in accordance with an established roster of seniority, or in other words as soon as a teacher has acquired the prescribed length of service he is automatically entitled to promotion.

Unfilled registered teachers' posts as well as posts for unregistered teachers are provisionally assigned to persons with the necessary qualifications, who act as temporary teachers or as substitutes for permanent teachers temporarily absent.

Temporary teachers' posts are assigned by the provincial superintendents (*provveditori agli studi*) for the duration of a school year, after a competitive selection on the basis of qualifications.

The career and recruitment of teachers are governed by regulations which are identical for all types of schools, both classical and technical.

Vocational and technical schools

The various types of vocational and technical schools and institutes constitute the second of the two groups of secondary schools.

This branch of education is all the more complex and interesting as it aims, through the vocational training of the workers and the training of the experts necessary for the various branches of production, to improve and increase the rate of production and the economic welfare of the nation; it therefore represents one of the most important social and economic tasks of the modern state.

Vocational and technical education naturally covers all sectors of production and economy—from agriculture to industry, handicrafts, commerce, tourism, trade, navigation and social welfare. It is provided at schools and institutes which were, in the past, subordinate to various Ministries according to their particular economic sectors and the purposes they had in view, but which, from 1928 on, gradually came under the direction and control of the Directorate-General of Technical Education of the Ministry of Education and were organized according to a uniform system by two fundamental laws: Act No. 889 of 15 June 1931, and Act No. 490 of 22 April 1932 together with Royal Legislative Decree No. 2038 of 21 September 1938.

The following schools and institutes are subordinate to the Directorate-General of Technical Education: *scuole secondarie di avviamento professionale* (lower secondary prevocational training schools); *scuole tecniche* (technical schools) and *istituti professionali* (vocational training institutes); *scuole professionali femminili* (girls' vocational training schools); *istituti tecnici* (technical institutes); *scuole di magistero professionale per la donna* (girls' vocational teacher training schools); schools and institutes having a special organization.

The education given at these schools and institutes comprises pre-vocational, vocational, and technical education.

Pre-vocational education is given at the *scuole di avviamento professionale.* The latter are free and compulsory post-primary schools open to pupils between 11 and 14 years of age. The course lasts 3 years and is intended to train boys and girls in agriculture, industry, commerce and seamanship. Two or more types of school can be combined in the same institute.

The *scuole di avviamento professionale* provide cultural and technical instruction and practical training in the various branches of economic activity with which they are concerned. The technical and practical training can be adapted to local economic needs; this enables the schools to play a more important role in the national economic life, in harmony with the local environment and traditions.

The *scuole di avviamento* of the industrial type usually provide specialized training in one or more of the following: mechanics and carpentry, building, textiles, mining, graphic arts, decorative painting, etc.

The *scuole di avviamento* of the commercial type may be of a general or specialized character and train for the hotel trade or the corresponding services on ships.

Those of the maritime type provide specialized training in one or more of the following: navigation, mechanics, building.

Mixed pre-vocational schools of an agricultural and industrial type, i.e., for pupils of both sexes, provide separate instruction for the girl pupils when there are more than 10. Thus, girls' industrial pre-vocational schools have been established as annexes; they provide general cultural training, like the corresponding boys' schools, but they differ from the latter in that the technical and practical training relates to women's careers, domestic science, household accounting and housekeeping in general. Separate girls' industrial schools have also been established.

The following general subjects are taught in all types of pre-vocational schools and courses: Italian, history and geography, mathematics, the fundamental principles of physics and the natural sciences, elementary hygiene, drawing, a foreign language, choral singing, religion, civics. The instruction in technical subjects, although of an elementary and pre-vocational character, is already differentiated from school to school, with a view to specialized trade training at the next stage.

In order to be able to achieve their ends, the *scuole secondarie di avviamento professionale* must possess a farm, workroom or model office for practical work, according to the purpose in view.

Vocational education is designed to complete the practical preparation of pupils leaving the *scuole secondarie di avviamento professionale* and to train workers for the various economic sectors. It is therefore intended for manual workers and office employees.

Vocational training is given at technical schools, girls' vocational schools, and vocational institutes; it comprises general education, theoretical and technical instruction and practical work.

The technical schools provide a 2-year course for any of the following branches of production and economy: agriculture, industry, handicrafts, commerce.

The task of the agricultural technical school is to train small farmers; it confers the title of *agente rurale* (rural agent). The latter is more like a technician than an ordinary

worker, as he possesses the necessary qualifications for managing a small landed estate. In general, however, school pupils become small farmers or *métayers* or lessees. According to local economic needs, the agricultural school provides specialized training in viticulture and wine-making, horticulture, stock-breeding, cheese-making, olive-growing and the manufacture of olive-oil. The curriculum includes Italian, history, geography, mathematics, elementary agricultural physics, economics and rural accountancy, agricultural industries, agriculture, draughtsmanship for agricultural purposes, stock-breeding, rural legislation, religion. Other subjects or wider and more detailed programmes are taught according to the various specializations. At present, however, apart from the S. Ilario agricultural technical school in Genoa, which specializes in horticulture, all other schools of this type provide training of a general nature.

The task of the industrial and artisans' technical school is to train workers for the various industries and handicrafts. In general, such schools provide training for one or more of the following groups: electricians, chemical research workers, agricultural mechanics, motor fitters, mechanics for food industries (mills, paste factories and bakeries), radio-electricians, radio fitters, etc. Other specialized training courses are given according to local needs. At the end of the course, the pupil sits for the school-leaving examination and, if successful, obtains the technician's or artisan's diploma according to the subject in which he has specialized. The curriculum includes Italian, history, geography, mathematics, elementary physics, chemistry and electrotechnics, mechanics, machinery engineering, technology, occupational draughtmanship, religion. Other subjects are taught according to the occupation in view.

The commercial technical school provides training for those intending to occupy minor executive posts in offices and commercial enterprises. This school confers the diploma of *computista commerciale* (commercial accountant). The curriculum includes Italian, history, geography, mathematics, a first foreign language, accountancy, mercantile computation, book-keeping, commercial institutions, commercial practice, the preparation of commercial products, the natural sciences, physics, a second foreign language, handwriting, typewriting, shorthand, religion. Instruction is also given in subjects connected with the hotel industry.

The girls' vocational training school prepares pupils for girls' careers and housekeeping. The curriculum includes Italian, history, geography, mathematics, elementary accountancy, the natural sciences, the preparation of commercial products, drawing, the elements of the history of art, domestic science, hygiene, women's occupations, a foreign language and religion. At the end of the course, successful pupils obtain a diploma which qualifies them for admission to the girls' vocational teacher training schools.

The above-mentioned vocational and technical schools must possess the installations and equipment needed for practical work. Thus, for instance, agricultural schools need a sufficiently large farm of at least 20 to 25 acres, equipped with tools, farm buildings, model sheds and adequate head of cattle, agricultural machinery, etc. The industrial schools must be supplied with adequately equipped installations, workshops and laboratories; the commercial schools with a model office, typewriters, calculating machines, etc.; and girls' vocational training schools must possess workrooms equipped either for women's occupations (tailoring, laundering, embroidery, darning and lace-work, knitting, etc.) or for domestic science (model kitchen, dining-room, etc.).

Vocational training is given not only at the technical schools and the girls' vocational training schools, but also at the vocational institutes. These institutions train skilled workers, specialized craftsmen, artisans and employees below executive rank. They qualify their pupils for posts in the various branches of industry, agriculture, handicrafts, commerce, the tourist trade, traffic, navigation, etc.; the regular training course can be completed by special courses, refresher courses and courses covering related trades.

Vocational institutes therefore offer practical training rather than general education, although they do not completely ignore the pupil's cultural development. They teach the fundamental principles of citizenship, which help to develop the worker's sense of moral and social responsibility, and the cultural, theoretical and technical ideas which are indispensable for the exercise of the various trades. Pupils are also required to do practical work.

These schools do not apply rigid curricula, but *profili professionali* (vocational training schedules), containing a brief but complete definition of all the operations which constitute any particular trade, together with an enumeration and analysis of the working tools and an indication of the various degrees of technical skill required for the different operations.

The vocational training institutes are open to pupils who have attained the age of 14 years, but there is no maximum age-limit. One of the functions of these institutes is to provide people who are already employed with an opportunity to acquire a sound theoretical knowledge of their trades and obtain the corresponding specialist's diploma. This diploma represents the official recognition of their skill and will subsequently, it is hoped, enjoy full legal protection through the awarding of regular trade certificates.

Owing to the different kinds of pupils admitted to the vocational training institutes, the latter, although pursuing the same aims, can operate in two different ways: firstly, as day schools providing complete training—theoretical, technical and practical—for post-primary-school pupils or persons who are not engaged in any work; and secondly as complementary schools, i.e. schools designed to complete —usually in the evenings—the practical training received by the pupils at the enterprises or farms where they are employed, by providing them with theoretical and technical knowledge.

Owing to the varied range and complexity of workers' occupations, the duration of the various training courses for the qualified or specialized workers' diplomas for the different branches of industry and economy and for the corresponding trades naturally varies.

Another characteristic of the vocational training institutes is the fact that they are open not only to pupils holding the leaving certificate of the *scuola media* or that of the *scuola di avviamento*, but also to pupils without any certificate or diploma, except that the latter must pass an entrance examination. With a view to facilitating their preparation for this examination, preparatory courses are organized at the institutes themselves.

Technical education aims at preparing pupils for the exercise of technical and practical occupations on a higher level than that of purely executive work, which is intended to be directed and controlled by those acquiring technical skill.

This technical education is given at the technical institutes and at the girls' vocational teacher training schools.

The technical institutes provide a 5-year course. They are classified as agricultural technical institutes, commercial technical institutes, surveyors' technical institutes, industrial technical institutes, nautical technical institutes and girls' technical institutes. Like the technical schools, the institutes must have the installations and equipment needed for thorough practical training.

Agricultural technical institutes have specialized courses in viticulture and wine-making, stock-breeding and cheese-making, olive-growing and the manufacture of olive-oil, horticulture, fruit-growing and gardening, colonial agriculture, mountain economy. (The agricultural technical institutes alone provide a further special course, lasting a year, at the end of the regular 5-year course.)

The curriculum covers Italian literature, history, geography, mathematics, physics, agriculture, economics and rural valuation, agricultural accountancy, stock-breeding, the natural sciences, plant pathology, general organic and inorganic chemistry, agricultural chemistry, agricultural industry, agricultural mechanics, the first principles of rural constructions, designs of constructions, elementary topography and topographical maps, the fundamental principles of agricultural law, religion. Other courses are given according to the specialization required. The agricultural technical institute confers the title of *perito agrario* (agricultural expert), indicating the expert's special subjects.

Maritime institutes have different courses for master mariners, engineers and shipbuilders.

In addition to the above-mentioned courses, others have been and can still be instituted according to local industrial and economic needs.

Industrial technical institutes offer courses in mechanical and electrical engineering, mining, textiles, dyeing, building, radiotechnics. The curriculum comprises Italian, history, a foreign language, mathematics, mechanics, machinery engineering, chemistry, the natural sciences, geography, physics, the fundamental principles of industrial law, draughtsmanship, technology, religion and the technical subjects relating to the various fields of specialization. The industrial technical institute confers the title of *perito industriale* (industrial expert), indicating the expert's special subjects.

Commercial technical institutes teach Italian, history, mathematics, physics, the natural sciences, chemistry, the science of commercial products, general and economic geography, accountancy, book-keeping, law institutions, a knowledge of commercial banking, customs and transport, a first foreign language and a second foreign language, political economy, the elements of finance, statistics, handwriting, shorthand, typewriting, religion. Other subjects are taught if the institute provides specialized training, e.g., special courses in foreign trade. The commercial technical institute confers the title of *ragioniere* (accountant).

The surveyors' technical institutes prepare pupils for land surveying, providing them with technical, theoretical and practical knowledge of agriculture, building and topography. The curriculum includes Italian, history, mathematics, physics, chemistry, the natural sciences, geography, elementary agronomy, economics, and rural technology, cadastral surveying, accountancy relating to rural work, constructions and designs for constructions, topography, topographical maps, architectural and ornamental draughtsmanship, the fundamental principles of civil law, religion. This institute confers the title of *geometra* (surveyor); the latter finds wide opportunities for employment in regions where farm properties are divided into small lots; his services are required for various operations relating to landed property, the parcelling out of lands, the planning of farmhouses, etc.

Nautical technical institutes train pupils for the master's certificate in the merchant marine or as marine engineers or as shipbuilders. There is a basic 2-year course common to all three sections, followed by a 3-year specialized course for each section. Instruction is provided in Italian, history, geography, physics, elementary chemistry, mathematics, mechanics, machinery engineering, a first foreign language, a second foreign language, drawing, the various kinds of rigging, as well as all the relevant technical subjects for each section, and religion. This institute confers, in respect of each of its sections—the merchant marine, marine engineering and shipbuilding—the diploma of *aspirante* (candidate) for the post of master mariner in the merchant marine, the post of chief engineer in the merchant marine or a professional post in shipbuilding.

Technical training for girls is given at the girls' vocational teacher training schools and at the girls' technical institutes. These institutes differ not only with respect to the length of their courses (2 years for the former, 5 years for the technical institutes), but also with respect to their aims. While the main purpose of the technical institutes is to prepare pupils for the technical and practical trades, and only indirectly to give the training necessary for those wishing to become *insegnanti tecnico-pratici* (teachers of technical and practical work), the task of the girls' teacher training school, as provided in Article 8 of Act No. 889 of 15 June 1931, is simply to train students who wish to become specialized teachers of women's trade and domestic science in the schools where they were educated.

Teachers of technical and vocational schools. All the various types of technical and vocational schools provide not only theoretical and cultural instruction but also practical training. The staff engaged in this practical training constitutes the category of teachers called the *insegnanti tecnico-pratici.* The career and legal status of these teachers, appointed on a competitive basis among persons holding a technical teacher's diploma, are different from those of teachers, properly so-called. Annual scholarships for refresher courses in Italy and abroad for *insegnanti tecnico-pratici* were instituted by Legislative Decree No. 690 of 29 May 1947 of the Provisional Head of the State, and the A. Pacinotti Teacher Training School was established in Pisa expressly for the purpose of training teachers of this category.

Teacher training schools

The *istituto magistrale* (teacher training institute) provides training for primary school teachers. Before 1940, i.e., before the establishment of the *scuola media*, the teacher training institute as indicated in the preceding paragraphs, provided a 4-year lower course, which gave pupils access, subject to their passing an entrance examination, to the 3-year upper course. After the lower course had been replaced by the *scuola media*, it was the leaving certificate of the latter school which gave access to the teacher training institute. In order not to reduce the entire study cycle by 1 year, a class was added to the teacher training institute—just as a class was added to the *liceo scientifico*—namely, a connecting class between the *scuola media* and the teacher training institute; the duration of the entire study cycle (7 years) thus remained unchanged. This connecting class, which will be given final shape by the proposed educational reform, still maintains to some extent, although provisionally only, the general features of the class (the last class of the lower course) from which it derives. It is characterized by having one and the same teacher for Italian, Latin, history and geography; one might say that the teaching is of a general nature as compared with the specialized training given in the classes of the teacher training institute proper.

The following is a complete list of the subjects taught in the latter classes: religion (students are exempted on request), pedagogy, philosophy and psychology, Italian and Latin literature, history, civic education, a foreign language in the second class (completing the study begun at the *scuola media* and continued in the connecting class), mathematics and physics, the natural sciences, chemistry, geography, drawing and the history of art, music and singing, physical instruction.

Any student who requests may be taught to play a musical instrument; it is optional. Students must also practise teaching in local primary schools, under the supervision of the teacher of pedagogy and the qualified teachers of the primary school concerned.

A certain number of these institutes also teach agriculture, so that students who intend to teach in rural schools will have some knowledge of the subject.

Every teacher training institute has a kindergarten annexed to it, i.e., a school for infants between 3 and 6 years of age. The institute's students, while studying for teaching in the primary school, which follows on the kindergarten, observe what takes place in the latter and the methods employed.

It must be pointed out that the teacher training institute, established by the 1923 reform, radically modified the curricula and methods of the pre-existing primary teacher training schools, which, owing to the technical nature of the training and practice teaching by students, gave little attention to general education.

The 'study plans' drawn up immediately after the war declare in a rather polemical tone that 'the crisis of the *istituto magistrale* is due mainly to the failure to give an appropriate direction to the future teacher's cultural training, as well as to the failure to assign to the teaching of pedagogy the task of orientating all other branches of learning and indicating the ends to be achieved'; they also state that 'the research carried out by philosophers, pedagogues and psychologists are by no means abstract lucubrations unrelated to historical realities or to moral, social and economic problems'.

A new direction was thus given to the teacher training institute, and this had an impact on all the branches of instruction given in the institute; the study of psychology and apprenticeship in teaching, which were formerly lacking, were added to the curriculum.

Both the 'national inquiry for the reform of school education' and the corresponding bill subsequently drawn up accentuate this orientation. The bill provides that the institute's course shall last 5 instead of 4 years as at present, the last year being reserved exclusively or chiefly for practice teaching; and, in order to facilitate this apprenticeship to teaching, a primary school, providing a complete course of education, must be placed at the disposal of every teacher training institute.

Other specialized schools

The following schools and institutes of art constitute a special sector of secondary education:

Scuole d'arte (schools of art), which train their pupils in artistic work and artistic production, according to the traditions, industries and raw materials of the region concerned. The course, which lasts 5 years, is followed by a leaving examination qualifying for the corresponding diploma. Those holding the diploma of the schools of art have access to innumerable craftsman's posts in various branches of the artistic handicrafts.

Istituti d'arte (institutes of art) providing two 3-year courses: a lower course corresponding to that of the *scuola d'arte*, and an upper course for pupils who, having already learnt how to execute designs in the work room, are trained in creative work in applied art and acquire the culture necessary for the training of master artisans. Special 2-year courses are attached to the principal institutes to train art teachers for the institutes and for the schools of art. Every institute or school of art comprises one or more sections given over to the most important artistic handicrafts; they include, in particular, sections for pictorial decoration, plastic decoration, artistic metal work and wood, ceramics, glass, the graphic arts, etc.

New courses were recently established, e.g., that devoted to animated cartoons, at the Urbino Institute for the Decoration and Illustration of Books; an upper course in advertising art at the Florence Institute of Art; and the course at the Trieste Institute of Naval Decorative Art.

A fundamental feature of all these schools is the work-room, where there is complete co-operation between art and working methods. Even the cultural training is directed towards the pupil's vocational and artistic education.

Licei artistici (upper secondary schools of the fine arts). These were established for the purpose of teaching art to all pupils with a genuine vocation.

The *licei artistici* comprise two sections: the first prepares pupils for the study of painting, sculpture, decoration and scenography in the schools of the Academy of Fine Arts; the second prepares pupils for the study of architecture in the higher schools. Each section has a 4-year course, the

first 2 years being common to both sections. Admission to the first class is subject to prescribed artistic and educational tests. For pupils holding the leaving certificate of the *scuola media*, this examination is limited to artistic tests. At the end of the course, pupils sit for the *esame di maturità artistica* (art qualifying examination). The first section gives access to the Academy of Fine Arts, and the second to the Faculty of Architecture.

Other important institutes devoted to the teaching of art are the Silvio d'Amico Institute of Dramatic Art, in Rome, and the National Academy of Dancing, also in Rome. The former trains actors and producers, and the latter trains ensemble and solo dancers, teachers and choreographers.

Lastly as regards instruction in the arts, mention must be made of the *conservatori di musica* (academies of music) which train or complete the training of pupils with a particular aptitude for music.

The *conservatori* provide main courses and complementary courses. The main courses are known as schools and are devoted to studies which qualify for a diploma. The instruction given in the individual schools is divided into two or three stages (lower and upper, or lower, middle and upper); the duration of the course varies from school to school, ranging from a minimum of 5 years (schools of singing) to a maximum of 10 years (for those wishing to obtain the diploma of composer, pianist or violinist).

The musical instruction is completed by complementary courses of cultural instruction.

Mention must be made of the steps taken by the Ministry of Education, in agreement with the Commissariato Nazionale della Gioventù Italiana (National Office for Italian Youth), for the establishment in Rome, of a college of music, which will be as residential institution. The ancient tradition of colleges of music, formerly attached to certain *conservatori*, has thus been revived.

Out-of-class activities

The participation of pupils in the internal organization and social life of the school is not provided for or regulated by any specific provisions, but is left to the initiative of the pupils and the school heads, who give their support and guidance.

Nearly all schools possess football, swimming and atheltic teams which take part in inter-school competititions and tournaments. Educational excursions for teachers and pupils as well as visits to museums and galleries are organized, and concerts and recitals are given for charitable purposes.

Pupils make themselves heard through lively and sometimes caustic articles in the small school magazines, in which, alongside of innocent caricatures of teachers and fellow pupils, questions relating to culture and school government are discussed.

In addition ot these local activities, mention may be made of two national organizations the C.I.V.I.S. and the A.GI.MUS.

The C.I.V.I.S. (Centro Italiano Viaggi Istruzione Studenti) (Italian Centre for Students' Study Tours), established by Act No. 1127 of 25 July 1952, is a body corporate in public law under the supervision of the Minister of Education and assisted by the Ministry of Foreign Affairs and the Ministry of Finance. Its headquarters are in Rome (Michelangelo Caetani, 32). Its task is to organize and promote individual and group exchanges between Italian and foreign students, organize tours abroad by Italian students—such tours being offered as prizes or in return for payment—and receive groups of foreign students visiting Italy for educational purposes.

The A.GI.MUS. (Associazione Giovanile Musicale) (Association of Musical Youth) is an organization devoted to music; it was established in 1949 for the purpose of enabling secondary school pupils to hear suitably adapted programmes of music (symphony, choral, chamber and operatic), usually preceded by illustrated lectures on the compositions and composers concerned. This association enjoys the patronage of the Ministry of Education and carries out its activities in numerous Italian towns.

TRENDS AND PROBLEMS

It may be maintained that, despite the various modifications it has undergone, the structure of the Italian secondary school is still fundamentally the same as it was when established by the Casati Law of 1859.

That is to say, it comprises, on the one hand, classical schools and institutes designed to train the national leaders, and, on the other hand, technical and vocational schools and institutes which are still unable to meet the ever increasing needs of modern techniques; both these sectors of education lack a school providing a uniform basic training.

Thus, the two most urgent problems confronting secondary education are as follows:

1. The establishment of a school for children between 11 and 14 years of age, for the purpose of providing them with a basic training, without involving a premature distinction between pupils who are and those who are not fit to continue their studies.

   This school, intended for all children who are still at an age when they have not yet clearly revealed their aptitudes, must not have strongly marked technical, scientific or literary trends, but must be such as to facilitate the transition from one to another of the various branches of instruction which it will provide. The subjects taught must not be of a specialized nature, and emphasis should be placed on the two groups of subjects which correspond to a school of basic training: the literary and historical group (Italian, history, geography and civic culture) and the scientific, mathematical and technical group.

   Its fundamental structure should take into account the optional subjects, which should not in any case begin until the second or third year of the cycle.
2. The gradual extension, through an increasingly greater network of vocational training institutes and the improvement of the technical institutes, of the range of vocational training and technical specialization. For that purpose, a legislative measure—already approved by the Council of Ministers—was drawn up with a view to the establishment on a permanent basis of the existing vocational training institutes, which have been operating

on an experimental basis for the last 8 years. As regards higher secondary education, the *licei* and technical institutes, the only questions for the time being concern adaptation rather than transformation.

Two bills, Nos. 377 and 378, deal with this question; they fix the duration of the institute's complete course—divided into a lower 2-year course of general training and an upper 3-year course of specialized training—as well as the conditions which must be satisfied to enable pupils to accede from the lower to the higher course. Lastly, mention must be made of the bill for a 10-year plan for educational development during the years 1959–69. Its aim is not a general reform of education, but the adaptation of the school to modern needs, due partly to the increase of the school population and partly to continued technical and scientific progress.

The 10-year plan proposes: (a) the adaptation of school buildings to the needs of schools of all kinds and at all levels; (b) the development of the lower secondary school for pupils between 11 and 14 years of age, so that compulsory schooling until the child reaches 14—as prescribed by the Constitution—shall become a reality for all children; (c) the adaptation of teaching and scientific materials to the needs of each type of school; (d) the increase of the budget appropriations for scholarships and school welfare services.

For that purpose, a financial plan has been drawn up, providing that the annual budgets for the period extending from the financial year 1959–60 to the financial year 1968–69 should include, in addition to the present funds for education, further appropriations for the same purpose, increasing from 57,905 million lire for the first financial year to 219,990 million lire for the last financial year, i.e., a total sum of 1,385,609 thousand million lire for the 10-year period.

STATISTICS

Population (mid-year 1958 estimate): 48,735,000.
Area: 116,304 square miles; 301,226 square kilometres.
Population density: 419 per square mile; 162 per square kilometre.

Summary of school statistics, 1953–56. Total enrolment at all levels of education was 7½ million students in 1956 representing about 16 per cent of the total population. There were in addition some 300,000 people attending adult education courses. Of the total enrolment, 14 per cent were pupils in pre-primary schools, 63 per cent in primary, 10 per cent each in general and technical secondary schools respectively, about 1.5 per cent in secondary teacher training courses and just under two per cent in universities and colleges. Girls made up just under half the enrolment in pre-primary and primary schools, 41 per cent in general secondary schools, 86 per cent in secondary teacher training courses and 28 per cent in universities.

The teaching staff in all schools at primary and secondary levels numbered 348,493 in 1956, of whom over 68 per cent were women. The average pupil-teacher ratios in 1956 were 36 in pre-primary, 26 in primary, 12 in general secondary, 12 in technical and 10 in secondary teacher training colleges. Compared with 1953, enrolment increased at all levels of education and in particular by 5 per cent in primary schools, 14 per cent in general secondary schools, 17 per cent in vocational institutions, 8 per cent in secondary teacher training schools and by 5 per cent in universities. (See Table 3.)

Enrolment trends in secondary education, 1930–56. From 1930 to 1941 average secondary enrolment more than doubled whilst the school age population showed some decline. The proportion of girls to total enrolment increased from 31 per cent in 1930 to 39 per cent in 1941. Since 1945, average enrolment in all secondary schools has steadily

increased, especially in vocational education. The ratio of secondary enrolment to the age group 15–19 years rose from 24 to 39 between 1945 and 1956. (See Table 4.)

Examination results in secondary education, 1953–56. In 1956/57 some 315,000 diplomas were awarded by general technical and teacher training institutions at the secondary level, representing an increase of about 15 per cent on the numbers passing the same examinations in 1953/54. Girls made up about 40 per cent of total successful candidates. Students passing the final examination of upper general secondary schools (*Esame di maturità*) increased by 44 per cent during this period and the number of teaching certificates granted increased by 27 per cent. All types of vocational diplomas awarded increased steadily, reflecting the rise in enrolment in institutions for vocational education. (See Table 2.)

Educational finance, 1957. Total receipts for education in 1957 amounted to 461,875 million lire representing about 9,527 lire per inhabitant. Of total receipts, 82 per cent were derived from the Central Government, 2 per cent from provincial governments and 16 per cent from local authorities (see Table 4). A partial breakdown of expenditure by the Central Government only is given in Table 1B.

1. For year 1930–41 separate figures for general, vocational and teacher training are not available.

2. Figures for 1955 and 1956 differ slightly in coverage from those for earlier years.

The most urgent educational and social problem in Somaliland, with the exception of the literacy campaign, has been and still is that of training the specialists required for the future social and economic development of the country. For this purpose the various schools and institutions shown in the diagram on page 733 have been established. All the schools at secondary level are at Mogadiscio, except the Agricultural School, which is at Genale.

Plans for the next few years include the opening of two further branches of the lower secondary school, at Calcaio (Mudugh) and at Baidoa (Alto Giuba), and of a higher commercial institute, and the extension of the courses of the Technical Training School, the Teacher Training Institute and the Agricultural School from 3 to 4 years.

The constitutional or statutory basis of the educational system as a whole has been established entirely by the Ministry of Social Affairs, which has full legislative powers with regard to the organization of education. The decrees providing for the various schools were promulgated after approval by the Council of Ministers and consultation with the Central Council for Education, which acts as an advisory body.

The most serious obstacle to the development of education lies in the fact that there is no written Somali language. All textbooks are in Italian or Arabic. A further difficulty in specifically scientific or geographical subjects is that certain local beliefs, deriving from the religious convictions of the people, have tended to slow down education and have sometime led to clashes, though these have all, in fact, been easily overcome. In the social field, however, educational organization has gained the upper hand, and has succeeded in improving the way of life, customs and general cultural background of the population.

There is no legislation or regulation concerning compulsory education.

THE DEVELOPMENT OF SECONDARY EDUCATION

The inception of secondary education dates to all intents and purposes from 1950, when Italy became the Administering Authority. The present schools were all founded in the period 1950–54. In subsequent years their position has been consolidated; they have shown themselves from the very first to be of vital importance to Somaliland.

Administration

All schools, whether primary or secondary, are established by the Ministry of Social Affairs, which submits its proposals to the Council of Ministers for approval, after consulting the Central Council for Education. The plans for the organization of a school and its curriculum are occasionally discussed and drawn up by a special committee, with the Minister as its chairman. Here again the Central Council for Education is consulted and the final provisions are submitted to the Council of Ministers.

In addition to the Ministry, which has general jurisdiction, regulations affecting secondary education are issued by the Department of Public Education and the Inspectorate of Secondary Education.

There are no regional or provincial organizations, as all secondary educational institutions except the Agricultural School are at Mogadiscio. Apart from the education authorities, the only office concerned with schools is the Department of Labour, which is also responsible to the Ministry of Social Affairs in respect of the aid provided by the International Labour Office for the Technical School. Relations with the International Labour Office are maintained through the Cabinet and the Secretariat of the Italian Trusteeship Administration.

The Inspector of Secondary Education is appointed by the Ministry of Social Affairs from among members of the education service with a university degree and a rank not lower than Class 5. The duty of the Inspector is to supervise the running and operation of all secondary schools and vocational schools in the Territory.

There are no other supervisory bodies, but plans are being drawn up for the establishment of a vocational training centre for industry and handicrafts, to assist the Inspector and head teachers in supervising the development of vocational and industrial schools.

Finance. The state budget constitutes the only source of funds. Funds for schools are allocated by the Ministry of Social Affairs, on the basis of annual expenditure, to the various educational services, which administer them through the appropriate offices. The cost of equipping schools is borne by the Ministry of Social Affairs and the cost of building them by the Ministry of Public Works.

Italian teachers, either established or on local contracts, are paid by the Italian Trusteeship Administration of Somaliland. Other Italian personnel recruited are paid from the budget of the Somali Government. All Somali personnel, whether established or not, are paid from the budget of the Somali Government.

Pupils pay no enrolment or tuition fees. Moreover, the Government frequently helps them with scholarships, grants for the purchase of stationery and books, provision of free boarding accommodation, etc.

Buildings and equipment. The existing standards for school buildings are similar to those prevailing in Italy, with a few slight variations required by the climate, and are to be found in *Istruzioni Tecniche del Ministero della Pubblica Istruzione* (Rome, 1925). This sets forth standards concerning choice of site, lighting, ventilation and exposure to sunlight, dimensions of classrooms, washrooms and lavatories, premises and open-air facilities for gymnastics and recreation. The regulations lay down that the maximum

number of pupils per classroom shall be 30 pupils, that the minimum area allowed per person must be 1.25 square metres, and the minimum cubic space per person 4 to 5 cubic metres. A room must not be more than 8 to 10 metres in length; the height must be 4 metres.

School welfare services. A medical and welfare service is organized in co-operation with the Health Department for the medical side, and with the Cassa Scolastica and the special school welfare institution for assistance to the needy. Vitamin tablets and milk are provided by Unicef. Teaching staff also benefit from the free health services provided by infirmaries and clinics.

TYPES OF SECONDARY EDUCATION

The school year begins on 1 July and ends on 28 February: first term, 1 July to 30 September; second term, 1 October to 31 December; third term, 1 January to 28 February. Holidays during the school year are as follows: weekly holiday on Sundays; shorter school day on Fridays; annual vacation from 1 March to 30 June; holidays for various religious festivals, Christian and Muslim. The length of the school day varies according to the type of school, the average being 5½ hours, with the exception of Fridays, when the hours are reduced to enable Muslim pupils to observe their day of prayer. The technical, marine and agricultural vocational training schools have longer hours to allow time for practical work.

General secondary schools

Other than the Italian lower secondary school and *liceo scientifico*, which are modelled on the corresponding types of institution in Italy, the schools or courses whose essential purpose is to provide general education rather than technical training include the lower and upper secondary schools, the School of Islamic Studies, the Domestic Science School for Girls, and evening courses for adults.

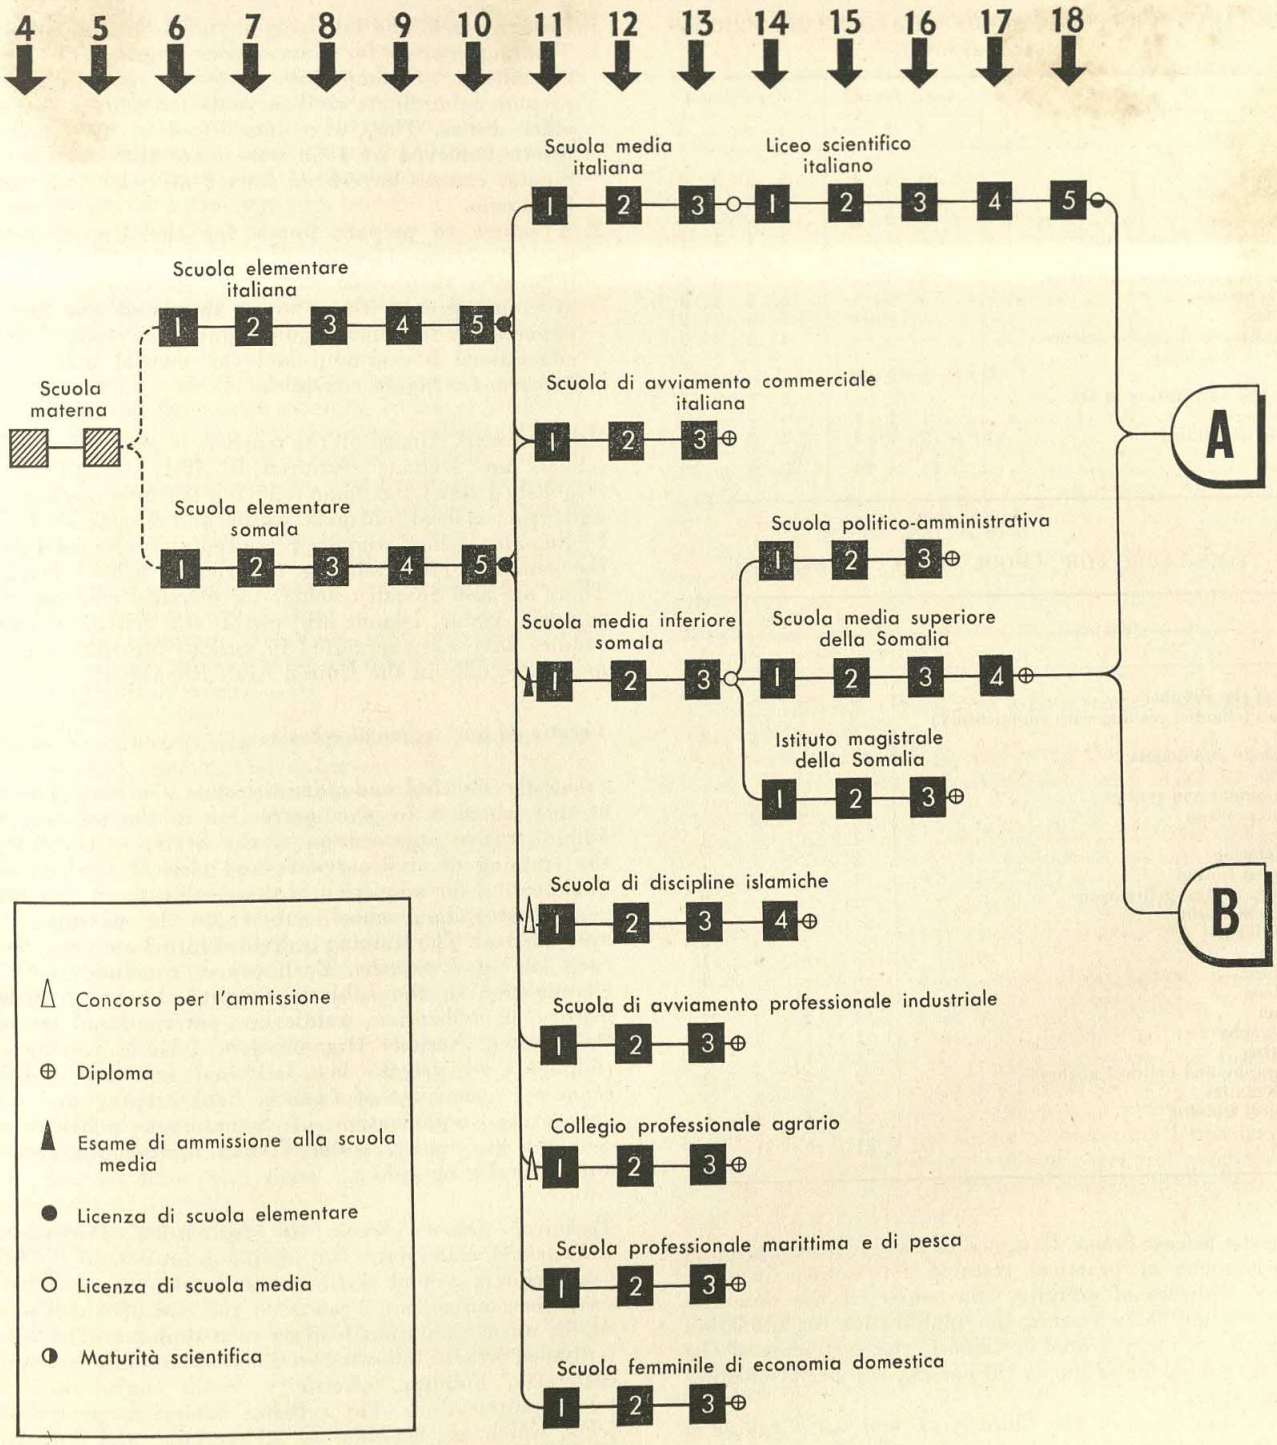
Lower and upper secondary schools. Admission to the 3-year Lower Secondary School (*Scuola media inferiore della Somalia*) is by an examination reserved for holders of the fifth-year primary school certificate. The course, which is the same for all pupils, concludes with a certificate examination, success in which admits to the 4-year Upper Secondary School (*Scuola media superiore della Somalia*), the School of Political and Administrative Training or the Teacher Training Institute. The time-table is given on p. 734.

School of Islamic Studies. This school provides a 4-year course divided into two 2-year stages, in the first of which general education—the same for all pupils—is given, while the second is sub-divided into two sections: (a) legal, for those who wish to become Shari'a (Muslim) lawyers; (b) religious, for theologians.

Admission to the school is on the basis of an examination taken by holders of the fifth-year primary school certificate. At the end of the fourth year pupils take a certificate examination. The time-table is given on p. 734.

GLOSSARY

NOTE. The 'Italian' schools (*liceo scientifico italiano*, etc.) are so called because they are exactly equivalent to schools of the same name in Italy. They are, however, open to all children on equal conditions, i.e. without distinction of race, sex or religion. The 'Somali' schools (*istituto magistrale della Somalia*, etc.) and all other schools in the diagram have been organized so as to provide an education specially adapted to the requirements of the territory and people. These schools, too, are open to all children on equal terms.



collegio professionale agrario: vocational training school of agriculture.
istituto magistrale della Somalia: Somali teacher training school.
liceo scientifico italiano: upper general secondary school of Italian type, with curriculum emphasizing mathematics and sciences, and including a modern language.
scuola di avviamento commerciale italiana: lower secondary school of Italian type, with curriculum emphasizing commercial subjects.
scuola di avviamento professionale industriale: vocational training school preparing for entry into trade and industry.
scuola di discipline islamiche: specialized lower secondary school of Islamic studies.
scuola elementare: primary school of Italian type (*italiana*) or Somali (*somala*).
scuola femminile di economia domestica: vocational training school of home economics.
scuola materna: pre-primary school.
scuola media inferiore somala: lower general secondary school of Somali type.
scuola media italiana: lower general secondary school of Italian type.
scuola media superiore della Somalia: upper general secondary school of Somali type.
scuola politico-amministrativa: upper vocational secondary school with curriculum preparing for careers in the administrative services of the territory.
scuola professionale marittima e di pesca: vocational training school for seamen and fishermen.

HIGHER EDUCATION

A. Universities education abroad.
B. *Istituto Superiore di Discipline Giuridiche, Economiche e Sociale:* Higher Institute of Legal, Economic and Social Studies.

EXAMINATIONS

Concorso per l'ammissione: competitive entrance examination.
Diploma: diploma.
Esame di ammissione alla scuola media: lower secondary school entrance examination.
Licenza di scuola elementare: primary leaving certificate.
Licenza di scuola media: lower secondary leaving certificate.
Maturità scientifica: 'maturity' examination completing upper secondary studies and leading to higher education.

Domestic Science School. Designed to provide for the gradual improvement of practical training for women in their various spheres of activity, the course at the domestic science school lasts 3 years, the qualification for admission being the primary school certificate, the certificate of the primary school for adults, or the passing of a special entrance examination.

On completion of the third year and after taking a special examination, pupils receive a diploma equivalent to that of the lower general secondary school. The principal subjects taught are Italian, general culture, Arabic, mathematics, drawing, hygiene and child care, housework, domestic economy and practical activities, and physical education.

Evening courses. The following should be mentioned:

1. Training courses for Government employees, whether established or temporary. These were instituted to prepare subordinate civil servants for more responsible office duties. They were introduced in 1956 and the results achieved by 1958 were more than satisfactory. Similar courses have been started at Belet Uen and at Chisimaio.
2. A course to prepare pupils for the Upper General Secondary School Certificate examination. This has made it possible to provide secondary schooling for a group of young people who, though they had not had the opportunity to follow regular courses of study, had the educational background and the mental maturity to fit them for higher education.

Teaching staff. Almost all the teachers in general secondary schools are Italians recruited in Italy (especially the established staff), but some relieving teachers are recruited under special local contracts. Arabic and religion are taught by Somali teachers who are recruited and organized under the ordinary rules relating to primary school teachers. There are also Somali teachers for physical training. Staff to teach Arabic, Islamic law, etc. at the School of Islamic Studies have been recruited in various Muslim countries, more especially in the United Arab Republic.

Vocational and technical schools

School for Political and Administrative Training. The aim of this school is to give instruction in the political and administrative organization of the State, specifically for the training of civil servants and clerical workers. The qualification for admission is the certificate of the lower general secondary school, subject to the passing of an aptitude test. The training is divided into 3 annual courses, each lasting 7 months. Each course concludes with an examination in the subjects taught; the latter include history of civilization, public law, international law and the United Nations Organization, Islamic institutions, rudiments of private law, criminal law and political economy, principles of finance, book-keeping and state accounting, organization of Somaliland, political and economic geography, Arabic, Italian, mathematics, science and general geography.

Technical School (*Scuola di Avviamento Professionale Industriale*). Candidates for admission must hold the fifth-year primary school certificate and take a psychological test. The course lasts 3 years, at the end of which pupils sit for an examination leading to a diploma. The school is divided into the following sections: automobile mechanics, carpentry, building, electricity, radio engineering, and telecommunications. The syllabus comprises general subjects, which are common to all sections, and vocational subjects.

This school is assisted by the International Labour Office and maintains close working relations with various industrial firms in the country through the Mogadiscio Chamber of Commerce. New curricula are now being tried out.

Commercial School. Candidates for admission must hold the primary school certificate. The course lasts 3 years, the subjects being religion, Italian, history and civics, geography, English, Arabic, mathematics, science and hygiene, commercial products, shorthand and typing, drawing and calligraphy, book-keeping and accountancy, physical training. At the end of the course students take an examination for a diploma.

Marine and Fishery School. The school is divided into an apprentice masters' section and an apprentice ship's carpenters' section, each of which offers a 3-year course open to boys not less than 12 years old holding the fifth-year primary school certificate. There is also a 1-year fisheries course for those who have passed the final examinations of the apprentice masters' section.

The curriculum for the 3-year courses includes general subjects (Italian and civics, English, Arabic, history, geography, mathematics, physics and drawing) as well as technical and vocational subjects. The subjects taught in the fisheries course, with the number of hours per week in brackets, are marine biology (2), technology of fishing (5), ships' engines (2), legal, economic and social aspects of fisheries (3), practical fishing (16).

This school maintains relations with private fishing firms, the majority of which are established on the coast of Nijertini (Gulf of Aden).

Agricultural School (*Collegio professionale agrario*). Like the school for seamen and fishermen, the agricultural training school is of particular importance to Somaliland, in view of the preponderantly agricultural character of the country's economy. The activity of this school has increased enormously since its transfer to Genale and consequent closer contact with the Agricultural Centre there.

The school provides three 1-year courses, promotion from one course to the next depending on the year's class marks. At the conclusion of the third year's study, pupils take an examination for the award of the Agricultural Expert's Diploma. Pupils are not left to their own resources during the holiday period, but spend part of the time at the experimental centres established by the Inspectorate of Agriculture and Zootechnics. Graduates can take refresher courses at the same school or at the various specialized centres or institutes in the Territory. In recent years two special courses have also been held for students from Arab countries.

A scheme for the revision of the school's curriculum and the establishment of a fourth year's course is at present under study. The present time-table is given opposite.

Teaching staff, whether Italian or Somali, are recruited for all the above vocational training schools in the same manner as for the secondary schools already described.

Teacher training school

The fundamental problem of primary and secondary schooling in Somaliland has been that of teacher training. For the first few years teachers had to be trained by means of intensive courses of short duration. But by 1957 the Teacher Training Institute was getting into its stride, and it now provides a 3-year course, at the conclusion of which students are required to take a regular examination to obtain their diplomas.

The requirement for admission to the institute is the Lower Secondary School Certificate, and students live in a residential college where they are given an allowance, board, lodging and clothing. Promotion from one class to another depends on marks at the end of the first year but on an examination at the end of the second year.

Although, as already stated, the institute is now operating normally, plans are being made to extend the length of the course to 4 years.

The teachers at the institute are all thoroughly qualified, with varying but adequate experience of teaching.

The subjects taught and the number of periods per week in each year of the 3-year course are as follows: Italian, 3; Arabic, 3; religion and Islamic law, 1; history, geography and civics, 3; education, psychology and practice teaching, 6 (7 in the third year); mathematics, 3; sciences (physics, chemistry, biology, general geography, agriculture), 4 (3 in the third year); drawing, 3; hygiene, 2; physical training, 2; total, 30.

Out-of-class activities

Pupils take a keen interest in school organization, and co-operate in a spirit of friendly understanding with the teachers. Although they have no official channel for putting forward their views, these are frequently taken into account in the measures adopted by the teachers and the higher authorities. In addition to physical training, students go in for a number of sports and games, such as volley-ball, basketball, athletics, etc., and annual matches are arranged between schools.

Students are now covered by a special Somali Student Organization, which has welfare, cultural and educational

functions. It has arranged a number of events which have all been highly successful and have helped to draw the attention of the general public to schools and student life.

TRENDS AND PROBLEMS

The progress of the secondary schools was delayed and sometimes frustrated because of inadequate basic education. But once the first formative period was over the schools settled down and have continued to develop on the characteristic lines of secondary schools.

Evidence of the range and soundness of the studies is provided, for instance, by the fact that diplomas issued by the Somali Upper General Secondary School are recognized as equivalent to those of the Italian *liceo*, so that young people holding diplomas from that school can enrol in the various faculties of the Italian universities without further formality. Scores of young Somalis are, indeed, attending different faculties, from law to engineering and from economics and commerce to medicine, nearly always with satisfactory results. The same may be said of the great number of pupils who have graduated from the various Italian vocational schools. They constitute a large and growing body of specialists who have taken over a number of responsible posts from Italian staff.

The chief problem with which the secondary schools now have to contend, however, is that of ensuring an adequate supply of teachers. In the primary schools the problem has been to some extent solved, first by providing intensive courses for teachers, and then by means of the ordinary courses given at the Teacher Training Institute; but in the secondary schools the problem is still almost as serious as ever. Hopes for the near future are based on the students now in Italy.

Certain reforms are contemplated with regard to the length of courses and the curricula of some of the schools. These relate essentially to the extension of the courses provided by the Teacher Training Institute and the technical and agricultural training schools.

Another serious problem is the shortage of textbooks; the solution of this problem is closely related to the question of a written Somali language.

It is safe to say, however, that from 1950 until the present day considerable progress has been made on reliable and well-organized lines, which will lead on satisfactorily to the end of the Trusteeship in 1960.

[*Text prepared by the Italian National Commission for Unesco in September 1959.*]

STATISTICS

Population (mid-year 1958 estimate): 1,320,000.
Area: 178,201 square miles; 461,541 square kilometres.
Population density: 7 per square mile; 3 per square kilometre.

Summary of school statistics, 1953–57. Total enrolment in all Somali educational institutions was nearly 34,000 in 1957/58, including 17,741 adults attending elementary schools. Approximately 2.6 per cent of the indigenous population were therefore receiving some form of education. Of the school-going population, excluding adult pupils, nearly 4 per cent were in kindergartens, 90 per cent in primary schools, over 2 per cent in general secondary schools, 0.3 per cent in teacher training and 1.5 per cent at the Higher Institute of Legal, Economic and Social Studies. In 1957/58, girls made up 23 per cent of enrolment at primary schools, against 17 per cent in 1953/54; there were 12 girls in general secondary schools compared with only 2 at the beginning of the period under review, and 62 girls were attending a domestic science course against 22 four years previously. There were, however, no girls training to be teachers in 1957/58 and none attending a higher educational institution. In adult education, women formed 10 per cent of enrolment in 1957/58 compared with only 4 per cent in 1953/54. The teaching staff at all full-time educational institutions numbered 864 in 1957/58, of whom 22 per cent were women. Compared with 1953/54, the teaching staff increased by over 160 per cent and the number of women teachers nearly doubled. The pupil-teacher ratio at primary schools was 20 in 1957/58 against 26 in 1953/54, and in general secondary schools 14 compared with 8 at the beginning of the period. With the notable exception of teacher training, enrolment made rapid progress at all levels of education. Compared with 1953/54, enrolment increased by 98 per cent in primary schools, by 159 per cent in general secondary schools, by 108 per cent in technical schools and by 67 per cent in adult education classes. Since its foundation in 1954, enrolment at the Institute of Higher Studies increased from 11 to 246 students. The teacher training school rapidly grew from 14 students in 1953/54 to 196 in 1955/56, but owing perhaps to re-organization of the courses on which information is not available, the enrolment declined to 33 students only in 1957/58. (See Table 1.)

Examination results in secondary education 1953–57. The figures on examination results shown in Table 2 reflect the rapid progress made in secondary education over the period under review.

Educational finance 1957. For the year 1957, total recurring expenditure for education amounted to 9,357,000 somalos, representing approximately 7 somalos per inhabitant. Details of expenditure by level and type of education are not available. (Official exchange rate: 1 somalo = 0.14 U.S. dollar.)

THE EDUCATIONAL SYSTEM

Education in Japan is governed by constitutional and statutory laws, which are implemented by Cabinet orders. The Constitution lays down basic educational policies and guarantees the right of all to receive an education corresponding to their ability. The Fundamental Law of Education, enacted in 1947, sets forth aims and principles in more detail, dealing specifically with equality of opportunity, compulsory education, school education, social (i.e. adult and youth) education, the prohibition of partisan political or sectarian religious education in the public schools, the proper control of education, etc. It forbids any discrimination on account of race, creed, sex, social status, economic position or family origin. This Fundamental Law was followed by a series of statutes, including the School Education Law, dealing with the organization and management of the school system.

Schools are recognized as providing a public service so that apart from the national government and local authorities only such bodies, having juridical personality, as are authorized by law are entitled to establish them.

The structure of the school system is shown in the diagram on page 741.

THE DEVELOPMENT OF SECONDARY EDUCATION

From the beginnings of the modern system to World War II. The history of modern education in Japan begins in 1872. In the field of secondary schooling the Education Order of that year prescribed the establishment of: (a) 6-year middle schools (*chūgakkō*) providing general education; (b) secondary vocational schools (*jitsugyō-gakkō*) providing agricultural, commercial, technical or other vocational training; and (c) part-time people's schools (*shomin-gakkō*) providing general and vocational education for young people in employment; all three types of school were for pupils who had completed 8 years of primary education. However, few vocational schools were established at that time, and the Order of 1872 was subsequently amended so as to establish agricultural, commercial, technical or other vocational courses in middle schools as well as the general education course. Thus middle schools provided both preparatory courses for higher education and vocational training at secondary level.

The development of secondary education from 1872 to 1900 was not so rapid as that of primary education, but by the end of the nineteenth century industrial and economic development created a great demand for technicians with secondary level training, and this stimulated the organization of a vocational secondary school system. In 1899, the aim of the middle school was clarified in the Middle School Order as being 'to provide advanced general education for boys', and the Vocational School Order laid down the requirements for agricultural, commercial, technical, mercantile marine and other vocational schools. At the same time, the Girls' High School Order set up high schools in which girls received general secondary education of the same level as that provided in the middle school for boys.

By the Orders of 1899, all secondary schools, both general and vocational, were single-sex institutions. Pupils who completed a 6-year course in primary schools were qualified to enter general secondary schools, which offered a course of 5 years for boys and 4 years (5 years rarely) for girls. Vocational secondary schools offered 3-year courses for those who had finished an 8-year course (6-year course rarely) in primary schools. The curricula for middle schools and girls' high schools (*kōtōjogakkō*) were prescribed in detail by the Ministry of Education. Vocational secondary schools, however, were permitted to arrange their own vocational programmes to fit in with local trades and industries. In vocational schools, ethics and some other general subjects were required.

This dual-track system of secondary education continued until the educational reform after World War II. Besides secondary schools, there was an upper elementary school which was attended by the majority of those who did not transfer to secondary schools. The Order of 1900 had provided that public primary education should be free, but for all secondary education tuition fees were payable. In 1947, the first 3 years of secondary education were to be made compulsory, and in public schools free. In the decade from 1900 to 1910 secondary education, both general and vocational, showed a marked development, the number of schools and pupils increasing by about 150 per cent. Especially noteworthy was the progress of girls' high schools and vocational schools. This expansion was partly caused by the prolongation of the compulsory education period from 4 to 6 years. The expansion of industry and the improvement of living standards after the Russo-Japanese War (1904–5) also had a great influence.

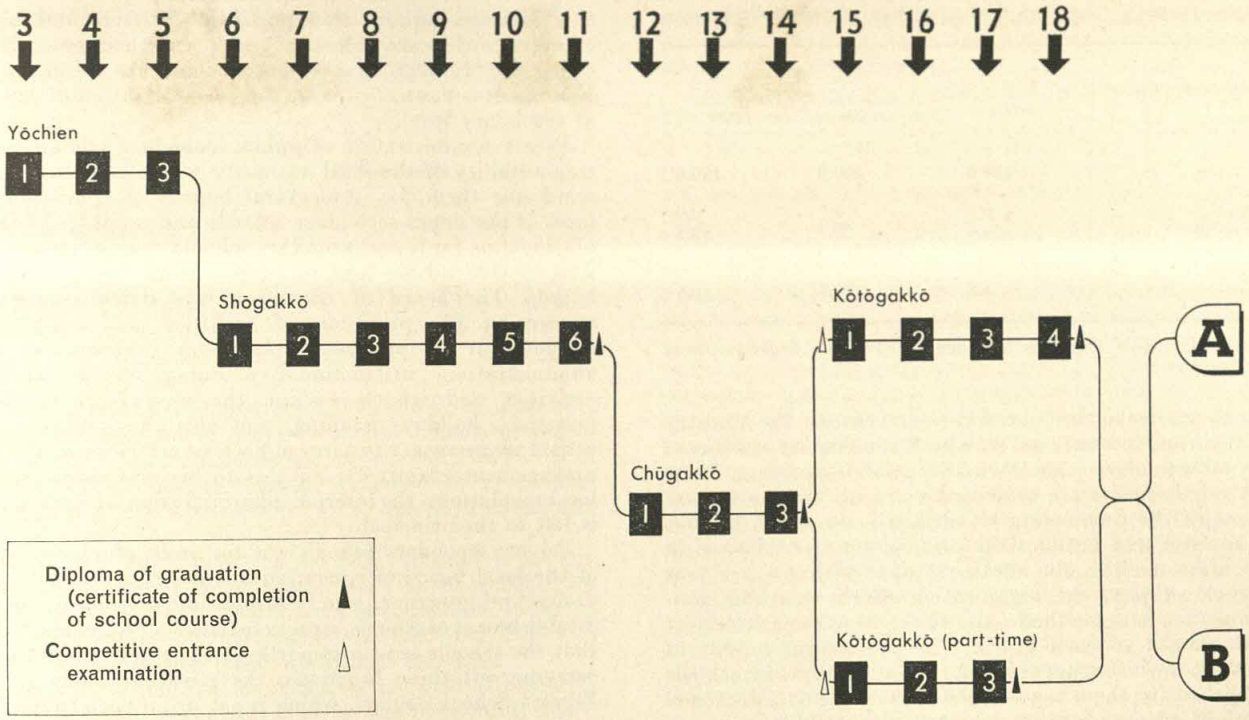
Between World War I and World War II there was another period of great progress in secondary education. In 1919, a revision of the Middle School Order stressed moral training, introduced experimental work in physics and chemistry, and gave more emphasis to practice in vocational subjects. Secondary education became more widespread. In 1931 the fifth (final) grade of middle school was divided into two courses, one giving general preparatory training for students entering upon a business career after their graduation, the other preparing for study at higher educational institutions. The former course emphasized natural science and vocational subjects, and the latter mathematics and foreign languages. This reorganization took into account the fact that two-thirds of middle school graduates proceeded to higher educational institutions and that one-third went directly into employment.

Girls' high school education was also modified: the

cultivation of a moral sense was stressed; more elective subjects were provided; the ordinary course was prolonged by 1 year (5-year course); to provide women students with an opportunity for higher education a 2-year advanced course was added.

In the vocational secondary school also a partial reform was carried out. The range of elective subjects was broadened so as to meet local needs and the number of classroom hours was reduced with a view to permitting more practical and experimental activity.

These reforms in the secondary school system after World War I were caused by the increasing demand for higher education. With the resulting expansion of secondary school enrolment, the social origins of the secondary school pupils were much more diversified and this brought about a change in the aims, organization and content of secondary education.



From 1941 to 1943 there was a revision of the entire educational system, on the basis of a proposal made by the Central Council for Education. This provided for the extension of the compulsory education period from 6 to 8 years. The three kinds of secondary school were brought into one system; the new secondary schools were still divided into middle schools, girls' middle schools (formerly girls' high schools) and vocational schools, but in order to simplify the system the division of the final year of middle school into two courses and the system of practical courses in girls' middle schools were abolished. There was provision for rearrangement and simplification of subject syllabuses in secondary education and for the establishment of evening courses in middle schools. However, owing to the war the prolongation of the period of compulsory education was not enforced, and as an emergency measure the middle school course was shortened to 4 years.

Educational reforms since World War II. Reforms beginning in 1947 introduced great changes in Japanese education, in particular a single-track in place of the traditional multi-track system. Those affecting secondary education, embodied in the School Education Law 1947 and the Course of Study 1949, revised in 1951, 1956 and 1958, included the following:

1. Secondary education was divided into two school levels: *chūgakkō* (lower secondary school) for the first 3 years, and *kōtōgakkō* (upper secondary school) for the second 3 years. The 3 years of lower secondary schooling became part of the 9-year period of free compulsory education.
2. Nine years' schooling was made compulsory not only for normal children but also for the blind or deaf and dumb.
3. Under the old school system, general and vocational education were conducted in different types of middle school. The reform provided that the first 3 years of secondary education should be in one kind of school, and that the second 3 years should offer various kinds of courses, general and technical, some institutions offering one course, others two or more.
4. Opportunities for upper secondary education were increased by the creation of part-time (4-year) schools in addition to full-time (3-year) institutions, and of correspondence schools. Students who attained the prescribed credits in part-time or correspondence schools could now obtain the same qualifications as graduates of full-time schools. In pre-war days, only 20 per cent of those who finished compulsory education went on to schools at secondary level, but over 50 per cent of the lower secondary graduates now receive upper secondary education.
5. In pre-war days, all secondary schools were single-sex institutions except for a very few vocational schools. Higher schools (*kōtōgakkō*), which were preparatory schools for universities under the old system, admitted only the graduates of middle schools (boys). Girls who wanted to receive higher education had to enter women's colleges, from which only a very small number of graduates were admitted to universities. In the new educational system, the principle of co-education in public lower secondary and upper secondary schools has been established, thus providing more opportunities for women to have access to higher education and to take up administrative or professional careers.
6. New curricula and courses of study. In lower secondary schools the main changes from pre-war days were the integration of history, geography and civics as one subject (social studies), the dropping of the separate subject of morals, and the inclusion of 'individual study', an elective subject, in the regular time-table.
7. The former normal schools (whose status had been raised in 1941 from secondary to higher education level) and the higher normal schools were abolished. Since 1947 all teacher training has been conducted exclusively in universities.

Although there have been minor amendments, the fundamental characteristics of the new system as described above have not much changed since 1947. Among measures taken to improve lower secondary education under the new 6–3–3 school system is the considerable increase in the national subsidies for the construction expenses of compulsory schools; formerly, these expenses had been borne by the municipalities. Increased national subsidies have also been made available for research in science and technical education, and the training of science teachers. There has been a small practical change affecting upper secondary schools which have general and vocational courses; to meet the demands of particular communities, the number of upper secondary schools with one specialized course is increasing in some cities.

To meet changing needs and demands the Course of Study has been revised several times since the 1947 reforms, the latest revision of the lower secondary school curriculum having taken place in 1958. The special features of this revision include increased emphasis on two basic subjects, Japanese and mathematics, and on scientific and technical education. The elective subject, vocational training and home-making, has been divided into special subjects such as agriculture, industry, commerce, etc., and in general the scope of elective subjects has been widened in order to give students more effective preparatory training for their future careers or occupations. Moral education, which was previously given through the teaching of social studies and some other subjects, has been made a separate subject and allotted 1 hour per week in all grades of the compulsory school course.

GLOSSARY

NOTE. In addition to the schools shown in the diagrams there are 'miscellaneous schools' which belong to the upper secondary or higher education level. These are mostly private vocational and trade schools, preparatory coaching schools, etc. Miscellaneous schools are not yet included in the regular school system.

chūgakkō: lower general secondary school, completing period of compulsory education. Private schools of this type are often combined with upper secondary schools and require pupils to take an entrance examination.

kōtōgakkō: upper secondary school; full-time school has 3-year course, and part-time, 4-year. Both provide general and vocational curriculum. Vocational courses include agriculture, commerce, fishery, home-making, industry, etc.

shōgakkō: primary school.

yōchien (kindergarten): pre-primary school.

HIGHER EDUCATION

A. *Daigaku:* university. All faculties award bachelor's, master's and doctor's degrees and are organized as follows: medical and dental—6-year course for bachelor's degree followed by 1 year as intern; teacher training—4-year course for bachelor's degree or in some cases 2-year course for second-class teacher's certificate; other faculties—4-year course for bachelor's degree.

B. *Tanki-daigaku:* junior college; provides 2- or 3-year course, mainly vocational in nature, leading to diploma.

Legal basis

The basic principle governing secondary education is set forth in the School Education Law enacted in 1947. Other laws and regulations which have some bearing on secondary education include those which deal with the organization and functions of local educational administration, the employment and certification of teachers, the responsibility of local authorities for salaries of staff in municipal schools, the national Treasury's share of the cost of constructing public schools, the enforcement of the School Education Law, standards for the establishment of upper secondary schools, the publication of textbooks, vocational education, science education, upper secondary part-time and correspondence education, private schools, etc.

Administration

The country is divided into prefectures and the prefectures into cities, towns and villages. Lower secondary schools are part of the compulsory education system and their establishment and maintenance are the responsibility of the municipality (city, town or village). In exceptional cases, private bodies may establish and maintain lower secondary schools. Upper secondary schools are usually established and maintained by the prefectural authorities, but there are also a considerable number of private upper secondary schools and a few run by municipalities.

The table on the next page shows the percentage distribution of secondary schools maintained by the various public authorities and by private agencies, as at 1 May 1959.

ADMINISTRATIVE STATUS OF SECONDARY SCHOOLS, 1959

Administrative status	Secondary schools		
	Lower	Full-time upper	Part-time upper
	%	%	%
Total	**100.0**	**100.0**	**100.0**
National[1]	0.6	0.7	0.0
Local public	94.8	70.2	93.4
Prefectural	0.0	64.5	76.2
Municipal	94.8	5.7	17.2
Private	4.6	29.1	6.6

1. National schools are those attached to education departments of universities.

As to curricula, the Central Government, i.e. the Ministry of Education, sets national standards which must be adhered to by all secondary schools whether public or private. These basic requirements are in accordance with the recommendations of the Curriculum Council, a body which advises the Minister and outlines the principles to be followed in curriculum making, the allotment of total hours per year for each subject, the organization of the teaching programme, teaching methods, and the content of each subject to be taught in each grade. The prefectural boards of education must see that the curriculum in individual schools established by them meets these requirements. Municipal boards of education have the same responsibility towards schools established by municipalities which include almost all of the lower secondary schools, being advised in these matters by the prefectural boards of education. Each school organizes its own curriculum with the guidance of the board of education or educational research institutes attached to the board, within the basic framework outlined by the Ministry of Education in its official curricula and courses of study. The daily schedule of school work is drawn up by the principal.

The authorization of textbooks is the responsibility of the Minister. To obtain this authorization, either the author or publisher applies to the Minister, who consults the Textbook Authorization and Research Council and bases his decision on the council's recommendation. Lists of authorized textbooks are published and sent to each school through the prefectural boards of education, which also hold 'textbook exhibitions' for the convenience of teachers in selecting books for local adoption. On the basis of proposals made by teachers, the prefectural boards decide which textbooks should be adopted for upper secondary schools; municipal boards perform the same function for the lower secondary schools. In the case of national and private secondary schools, principals make the final decision.

As an exception to this procedure, textbooks for some fields of vocational education in upper secondary schools are compiled and published by the Ministry of Education itself, commercial publishers being unwilling to make the necessary investment in view of the small market.

Control. The Ministry of Education supervises, advises, and allocates financial aid to local boards of education, and requires from them reports upon the secondary education activities under their jurisdiction. As occasion demands, the Ministry inquires into particular matters and issues whatever orders are necessary to improve them or set them right. No central agency other than the Ministry of Education is concerned with the administration of schools at secondary level.

Direct administration of public secondary schools is the responsibility of the local authority which establishes and maintains them, i.e. prefectural boards of education for most of the upper secondary schools and municipal boards of education for lower secondary schools; municipal authorities receive advice and assistance from the prefectural boards. The board of education lays down regulations concerning the provision of facilities and equipment, employment of personnel, classroom organization and administration, instructional planning, extra-curricular activities and schools events, the use of instructional materials, holidays, staffing, and also the guidance and assistance necessary to carry out school activities and school management effectively. Subject to his observance of the local regulations, the internal administration of each school is left to the principal.

Private secondary schools are not under the jurisdiction of the local board of education but are supervised by the prefectural governor, who is responsible for approving the establishment of schools, issuing teachers' certificates, seeing that the schools send in reports on their activities, etc. In carrying out these functions, the governor refers to the Private School Council, which is set up in each prefecture as an advisory organ.

Supervision. In order to give proper and sufficient guidance to secondary schools, the Ministry of Education has supervisors, and prefectural and municipal boards of education have teachers' consultants. Ministry supervisors are mostly appointed from among university professors and prefectural superintendents, and teachers' consultants from among experienced teachers. There were over 2,200 teachers' consultants in 1958, including those for primary education.

Finance. Expenditure on public lower secondary schools is met from municipal funds, prefectural subsidies and national subsidies. In addition to public funds, private donations, e.g. from parent-teacher associations, also contribute to the support of lower secondary education. Money spent on public upper secondary schools comes mostly from prefectural funds, but partly also from national subsidies or private donations, except in those cases where upper secondary schools have been established by municipalities, when the expenditure is borne mainly by municipal funds.

The table on the following page shows the percentage distribution of expenditure by source of revenue on lower and upper secondary schools in 1957–58.

The principal source of income of the local authorities is taxation. In addition, revenues from miscellaneous sources such as rents, fees, etc., contribute to the support of educational activities. These revenues are credited to the general funds of government. There are no education taxes in Japan.

The construction of secondary schools is normally paid for by the local bodies responsible for their establishment and operation. However, since the war national subsidies have been provided to assist in school building. The rates

of national subsidies offered are half to one-third of the cost of new construction of lower secondary schools or reconstruction of war-damaged secondary schools, two-thirds of the cost of rebuilding schools damaged in a national calamity (e.g. earthquake), and up to one-third of the cost in other cases.

The cost of equipment for secondary schools is usually borne by whatever local public body is responsible for the establishment and maintenance of the school. In recent years, national subsidies for these have been increased with a view to encouraging local educational activities.

Secondary school teachers' salaries are paid as a rule by their appointing authority, that is, the prefectural board of education except in the case of municipal upper secondary schools. But half the salaries of lower secondary school teachers are met by the Government, and the salaries of teachers in municipal part-time upper secondary schools are paid by the prefecture.

In public lower secondary schools no fees are charged, in accordance with the principle of free compulsory education. Moreover, to secure universal attendance at lower secondary schools, various measures are taken to assist pupils from needy families, such as free distribution of textbooks and free school lunches. In public upper secondary schools, pupils pay tuition fees amounting on an average to about 600 yen per month; the amount varies among the prefectures. Able pupils are helped by a system of scholarships which has been expanded in recent years.

Buildings. The Central Government has established the following standards for school buildings: a minimum of 3.6 square metres space per pupil and 0.7 square metres for gymnasiums and halls in lower secondary schools, and 4.8 square metres and 0.8 square metres respectively for pupils of upper secondary schools. Standards for heating, lighting and sanitation are not fixed by law.

School welfare services. The school health and medical service includes health consultation, physical examination, tuberculin test, BCG vaccine, chest X-ray, dental examinations, etc. Almost all secondary schools are served by one or more school doctors and dentists, and about 50 per cent of the lower secondary schools and 90 per cent of the upper secondary schools have rooms for this service.

School lunches are provided in many lower and upper secondary schools in urban areas. There is also a special law under which national subsidies are paid to part-time upper secondary schools operating school lunch programmes, so as to encourage the attendance of young people in employment.

Assistance to needy families has been mentioned under the section Finance above.

TYPES OF SECONDARY EDUCATION

There are two levels of secondary education, lower and upper. All children who complete elementary school (6 years' primary schooling) enter the 3-year lower secondary schools which come within the 9-year period of compulsory education and are the only type of school provided for children in the corresponding age group (ages 12, 13 and 14). Upper secondary schools cater for pupils who wish to continue their general studies or intend to enter institutions of higher education and also for those desiring vocational or technical training. Students who have completed either a general or a vocational course are able to advance to higher education. Actually, however, most of those who do so have taken the general course; those who graduate from a vocational course usually seek employment. There are also a number of 'miscellaneous schools' at upper secondary or post-secondary level, most of which provide specialized trade training. Institutions of higher education which absorb upper secondary school graduates are of two kinds: universities and junior colleges.

The school year begins on 1 April and ends on 31 March. Lower secondary schools divide the year into three terms, while upper secondary schools adopt either a two-semester or three-term year. Prefectural boards of education fix the dates of terms and holidays. Schools in agricultural areas may be granted special holidays when the children are required to work in the fields, the number of such holidays and the times at which they are given varying in different parts of the country. All schools must, however, keep open for the minimum number of school hours per year prescribed by the Central Government in the standard courses of study or curricula.

Lower secondary schools

The School Education Law states that the aim of the lower secondary school is to provide general education appropriate to the stage of physical and mental development of the pupils and based on the education given at the primary school. To realize this aim the lower secondary school endeavours to cultivate in the pupils the qualities they will need in order to play their part as members of society and the State; provide them with the fundamental knowledge and basic vocational skills required in society; encourage respect for labour; help pupils to select the future course that is best suited to their individual talents and aptitudes; promote their social activities in and out of school; guide their emotional development along healthy lines and foster sound judgement. Any pupil who has completed primary education can enter a lower secondary school established by the municipality in which he or she lives, without any examination.

Pupils in lower secondary schools are divided into groups according to grades and classes. But there is no educational

discrimination, i.e. streaming by course or ability; all pupils are on an equal footing and receive a uniform type of general education which must achieve the same standard throughout the country.

The curriculum in lower secondary schools consists of required subjects, elective subjects, moral education and extra-curricular activities. Details are shown in the following table. (Figures show the required total of class periods per year and, in parenthesis, the number of periods per week. A class period is of 50 minutes' duration and is referred to as a 'school hour'.)

CURRICULUM IN LOWER SECONDARY SCHOOLS

In addition to laying down the amount of time to be devoted to the various subjects, the course of study describes the aims and content of each subject in detail and gives general directions concerning the lines along which the teaching should be conducted.

Individual pupil records are kept. The Ministry of Education requires that these should cover scholastic achievement, health, daily attendance and behaviour. Scholastic achievement is expressed by grades of from 1 to 5. Various kinds of educational tests are used, the choice being left to each school authority or to the class teacher. As to examinations, the law lays down no special standards, nor does the Ministry of Education make any particular indication.

Teachers in lower secondary schools hold a certificate in their respective subjects. These certificates are conferred, as a rule, on students who have attended college or university for at least 2 years and who have acquired a prescribed number of credits. They must also have had professional teacher training or training in education faculties of universities. Although public lower secondary schools are established by towns and villages, the appointment of teachers in these schools and the payment of their salaries are the responsibility of the prefectural authorities.

Upper secondary schools

The courses offered in upper secondary schools fall into two main types: general, and vocational or technical. The latter group covers agriculture (including general agriculture, forestry, sericulture, gardening, stock raising, horticulture, agricultural civil engineering), commerce, domestic arts, fishery, science, technology (including mechanical, electrical and civil engineering, communication, shipbuilding, chemical industry, construction, metallurgy, mining, textiles, ceramics), etc. Upper secondary schools are of three types: (a) those which provide only the general course; (b) those which offer vocational courses in one or more areas (as will be explained below, all vocational courses include a required minimum of general education); (c) composite schools providing both general and vocational courses. Upper secondary education is available in full-time schools with a 3-year course, or in part-time schools where the lessons are so organized that they can be given in the evening or at other stated times and the course extends to 4 years. There are also correspondence courses at this level, although for some subjects which require practical work, pupils are required to attend schools for certain days. The same qualification is given to graduates of all three types of school: full-time, part-time or correspondence.

Graduates of lower secondary schools are permitted to enrol in the general or vocational course of their own choice, subject to enrolment limitations and to their passing the required entrance examinations.

The principal of an upper secondary school is responsible for the admission of students to the school. As the number of applicants always exceeds the fixed number of pupils to be admitted, selection is necessary. In public upper secondary schools, which make up more than 70 per cent of all upper secondary schools in Japan, the selection is made on the basis of reports submitted by the lower secondary school, and the results of an examination conducted by the board of education which maintains the upper secondary school. This is a common examination held simultaneously for all candidates within a prefecture.

The upper secondary school course is organized on the system of awarding credits for work accomplished. Thirty-five school hours per year in a subject is the minimum required for one credit. A school hour is defined as a 50-minute class period, and a school year consists of at least 35 weeks of 6 days per week. The minimum number of credits required for graduation is 85, i.e. the total number of school hours is at least 2,975. Since the number of credits obtainable may differ from one subject to another and sometimes within the same subject, and since the various courses permit numerous combinations of elective subjects, the number of school hours required ranges from 2,975 to 3,885, these being spread as evenly as possible over the 3-year (full-time) or 4-year (part-time) period of study.

The following table, which takes account of the latest revision (1956) of the upper secondary curricula, shows the

areas of study, the subjects in each area, and the number of credits which the student can obtain in each subject. Thus the subject Japanese language 'A' is either a 9-credit or a 10-credit course, while credits obtainable for Japanese language 'B' range from a minimum of 2 to a maximum of 6. Credits are taken in varying patterns, e.g., students taking Japanese language 'B' take not less than 2 or more than 3 credits per year in this subject.

AREAS, SUBJECTS AND CREDITS IN UPPER SECONDARY SCHOOLS

Area	Subject	Number of credits
Japanese language	Japanese language 'A'	9, 10
	Japanese language 'B'	[1] 2–6
	Chinese classics	[1] 2–6
Social studies	Civics	3–5
	Japanese history	3–5
	World history	3–5
	Cultural geography	3–5
Mathematics	Mathematics I	6, 9
	Mathematics II	[2] 3
	Mathematics III	[3] 3, 5
	Applied mathematics	[4] 3, 5
Science	Physics	3, 5
	Chemistry	3, 5
	Biology	3, 5
	Geology	3, 5
Physical training and health	Physical training, Health	[5] 9–11
Arts and music	Music	[6] 2–6
	Fine arts	[6] 2–6
	Handicrafts	[6] 2–6
	Calligraphy	[6] 2–6
Foreign language	Foreign language I	3–15
	Foreign language II	2–4
Domestic arts	General home-making and 23 other subjects	For 1 subject, 2–4 (min.) 6–8 (max.)
Agriculture	General agriculture and 39 other subjects	For 1 subject, 2–4 (min.) 12–36 (max.)
Technology	Machine practice and 136 other subjects	For 1 subject, 2–4 (min.) 8–25 (max.)
Commerce	General commerce and 19 other subjects	For 1 subject, 2–4 (min.) 2–8 (max.)
Fishery science	General fishery and 28 other subjects	For 1 subject, 2–5 (min.) 2–20 (max.)

1. The number of credits taken in a year is 2 or 3.
2. Studied after taking at least 6 credits of Mathematics I.
3. Studied after taking 3 credits of Mathematics II.
4. Studied after Mathematics I or II.
5. Two credits are given to Health.
6. The number of credits taken in a year is 2.

A certain number of subjects are compulsory for all students in all courses: Japanese language 'A', three subjects in the science area, mathematics I, physical training and health. Students are also required to complete over the 3- or 4-year period a minimum of 6 credits in the combined areas of arts and music, home-making and vocational training. In vocational courses, students must complete over 30 credits in vocational areas. They must also participate in extra-curricular activities for 1 to 3 hours per week, although no credits are given for this.

Below are given two examples of courses, one showing the requirements for a general course in a particular school and the other a typical vocational course in mechanical engineering.

AN EXAMPLE OF LOCAL CREDIT REQUIREMENTS IN THE GENERAL COURSE (by grade)

Area	Full-time			Part-time

Grand total		108	96

Achievement testing, reporting on pupils, promotions and examinations in upper secondary schools are organized as for lower secondary schools (see above).

Teacher certificates for upper secondary schools are for specified subject areas and are granted by the prefectural board of education. The provisions of the Educational Personnel Certification Law require those studying for certificates to obtain university credits in courses prescribed by the Ministry of Education. In order to obtain upper

secondary teacher certificates, the students must acquire the prescribed number of credits in general education subjects, pedagogical subjects and professional subjects. The necessary number of credits in professional subjects varies with the subject area.

Other specialized schools

Some upper secondary schools have independent courses in music or fine arts together with courses for general education, agriculture, technology, commerce, etc.

Other educational institutions of secondary level include miscellaneous schools (*kakushugakkō*). As the first 3 years of secondary education are compulsory, most schools of this type admit students who have successfully completed lower (or upper) secondary schools. Conditions of admission are similar to those for upper secondary schools or higher educational institutions. However, the duration of the course is not uniform and there are a number of 1-year or ½-year courses. Most of the miscellaneous schools are highly specialized vocational schools (such as typewriting schools, trade schools, etc.) or schools offering courses in home-making. They also include coaching schools (generally nicknamed *ronins*) for students who are obliged to re-sit the entrance examinations to universities and other higher institutions; miscellaneous schools of this type are becoming more and more numerous in large cities where famous universities are located. The total number of miscellaneous schools of all kinds is about 7,000, more than the number of upper secondary schools, but as they are usually quite small the total enrolment is less than in upper secondary schools.

For the convenience of young employees who have graduated from lower secondary schools, some factories or firms conducting large-scale enterprises have their own training institutions for technicians and provide general as well as technical education.

Out-of-class activities

Each lower or upper secondary school has a students' association through which students discuss how to improve their school life; some matters they settle by themselves, in other cases they present their opinions to the school authorities. Since the war, there has been an increase of social service activities through the Junior Red Cross or other associations. The greater part of the students join sports clubs at their schools; inter-school matches or athletic meetings are popular, and every year more than 10,000 students participate in the local preliminary matches for the all-Japan upper secondary school baseball meeting. Cultural societies in the fields of music, fine arts, drama, and literature, etc., are also active. A considerable number of schools issue a school newspaper or periodical.

TRENDS AND PROBLEMS

With the development of the national economy, the shortage of technicians and of engineers and scientists is becoming an increasingly serious problem. Measures for the expansion of technical education are therefore being taken by the Ministry of Education and local authorities. A considerable number of secondary technical schools have been established and a long-range programme for the expansion of secondary technical education drawn up.

After the war, general education was more emphasized in lower secondary schools, and in upper secondary schools a universal comprehensive system was introduced. However, to meet the increasing demand for secondary school graduates with practical training, and also to produce a sufficient number of graduates with basic academic knowledge, a more effective differentiation of courses is under discussion.

The problem of how to give more opportunities for young people in employment to obtain upper secondary education is a matter of some concern to the educational authorities. As a first step, the curriculum of the vocational correspondence course has been broadened.

With the progress of science and the development of industry, a higher level of scientific knowledge is required from school graduates. Nation-wide tests conducted by the Ministry of Education in 1956–58 showed a lack of thorough grounding in mathematics, science and some other subjects. On the recommendation of the Curriculum Council, the Ministry of Education has therefore revised the curriculum for lower secondary schools, and is now compiling a new curriculum for upper secondary schools. The Ministry suggests that much more emphasis should be put on basic and systematic instruction. Moral and physical education also need to be reinforced.

STATISTICS

Population (mid-year 1958 estimate): 91,760,000.
Area: 142,726 square miles; 369,661 square kilometres.
Population density: 643 per square mile; 248 per square kilometre.

Summary of school statistics, 1953–57. In 1957/58 total enrolment was over 23 millions not including persons attending youth classes who numbered almost 1 million. This represents a school-going population equal to one-fourth of the total population, the same proportion as in 1954/55. It may be noted that primary education accounts for only 56 per cent of the total enrolment.

The proportion of girls was 49 per cent in elementary schools and 50 per cent in lower and upper secondary schools, but less in vocational schools and in institutions of higher education. Nevertheless a slight increase may be seen between 1953 and 1957: in vocational schools, 37 per cent in 1957/58 as against 33 per cent in 1953/54; in higher education, 18 per cent in 1957/58 as against 16 per cent in 1953/54. The proportion of women on the teaching staff was 46 per cent in primary education and 20 per cent in general secondary education. As compared with 1953/54, these proportions had decreased very slightly.

Enrolment in vocational schools was 16 per cent of the enrolment in secondary schools of general education but enrolment in the former increased more rapidly than in the latter.

The pupil-teacher ratio in primary schools was almost the same in 1957/58 (37 pupils per teacher) as in 1953/54 (35 pupils per teacher). (See Table 2.)

Enrolment trends in secondary education, 1930–57. The average total enrolment shows a large increase from 1930–34 to 1955–57 with a high rate of increase since 1945–49. This reflects the reform of the school system. The average total enrolment for 1955–57 was eight times that of 1930–34.

The ratio obtained by relating the average total enrolment to the estimated population 15–19 years old reached almost 100 per cent for the period 1955–57. (See Table 3.)

Examination results in secondary education, 1953–57. From 1953 to 1957 the number of lower secondary school certificates increased by 24 per cent, and that of upper secondary school certificates by 14 per cent. The number of certificates granted to girls was relatively higher in 1957 than in 1953, nevertheless the proportion of girls has remained less than 50 per cent. (See Table 1.)

Educational finance, 1957/58. During the fiscal year beginning in April 1957, a total of 526,000 million yen was spent on education. (See Table 4.) Expenditure on private education represented 13 per cent of this total. Of the amount spent on public schools 32 per cent came from the Central Government, 40 per cent from provincial governments (including tuition fees), 22 per cent from local authorities (including tuition fees). Recurring expenditure was 81 per cent of the total expenditure on public schools, capital expenditure was 18 per cent and the remainder was spent on debt service.

In 1957/58, tuition fees in private schools constituted 58 per cent of the total receipts of these schools. The sum contributed by the Central Government, provincial governments and local authorities to private schools was about 10 per cent of the expenditure on education made by these schools. Total expenditure for private schools was distributed as follows: recurring expenditure, 72 per cent; capital expenditure, 20 per cent; debt service, 8 per cent.

10. Not including a balance of 4,003 million yen carried over into the following year.

JORDAN

THE EDUCATIONAL SYSTEM

'Jordan is a part of the Arab homeland, and the Jordanian people are a part of the Arab nation. Jordanians are equal before the law and there is no discrimination among them as regards rights or duties, despite their racial or religious differences. Within the limits of its powers, the State ensures employment and education and provides security and equal opportunities for all.' This general philosophy, laid down in Articles 1 and 6 of the Constitution, is the basis of Jordan's educational system, which aims at 'providing educational opportunities for the people, developing the individual's personality and civic responsibility and bringing up a generation which is sound in body, religious belief, thought and character, fully conscious of its duty towards God and the homeland and actively contributing to the advancement of the country'. (Article 3 of the General Law of Education, No. 20, of 1955.)

The educational system comprises the following stages: (a) primary—6 classes, ages 7 to 13. Under Article 20 of the Constitution, primary education is compulsory for Jordanians and free in government schools; (b) intermediate (lower secondary)—3 classes, ages 14 to 16; (c) upper secondary—2 classes at present, but 3 as from 1961, ages 17 to 19.

At the end of each stage, a public examination is held by the Ministry of Education as a basis for selecting entrants to the succeeding stage. Successful candidates in the upper secondary examination are awarded the Secondary Education Certificate, which qualifies for entrance to university.

Most Jordanian pupils study in government schools run by the Ministry of Education. There are also schools operated by the Ministries of Defence, Social Affairs and Agriculture, or the Waqfs (Religious Foundations) Department, and a number of private schools some of which are Jordanian (Muslim or Christian) and some foreign. Jordan is host country to a large number of Palestine Arab refugee children, the majority of whom attend schools run jointly by the United Nations Relief and Works Agency (UNRWA) and Unesco (see special chapter at the end of the book).

The General Law of Education of 1955 lays down that all schools in Jordan are subject to the supervision of the Ministry of Education (Article 34). Private schools, whether national or foreign, must teach Arabic, history, geography and civics, in accordance with the syllabuses and aims of the Ministry of Education. Teaching and examinations in these subjects must be conducted in Arabic and under the supervision of the Ministry (Article 33). The Ministry of Education is responsible for laying down general policy for the various stages of the educational system; it does so after due consultation with the Supreme Educational Council, a purely advisory body composed of a number of eminent Jordanian educationists, and with the various educational organizations (Article 26).

THE DEVELOPMENT OF SECONDARY EDUCATION

In recent years secondary education in Jordan has expanded greatly and undergone many changes. Whereas in 1945 there were only 5 schools at this level there are at present (1959–60) more than 230, with over 50,000 pupils, boys and girls.

The greatest development occurred in 1949–50, when Jordan was called upon to provide education for Palestine refugee children, a responsibility taken over by UNRWA on 1 May 1950. As a result of the incorporation of part of Arab Palestine with Jordan and the increase in population, in addition to the increase caused by the influx of refugees, there has been an expansion in private secondary schools; the number of these schools and of their pupils has increased more than tenfold since the period prior to 1945.

In 1952 secondary education was still purely academic and paid no regard to the individual aptitudes and abilities of the pupils. The Ministry of Education recognized the necessity of providing diversified secondary schooling but for financial reasons could not bring this about, and had to be content with establishing commercial, agricultural or industrial classes, according to local requirements, in the already existing schools. At the same time, the Ministry expanded the Industrial School at Amman and the Khuduri Agricultural School at Tulkarm, both government schools, enabling them to accommodate 150 new boarders every school year, a figure which is still only a very small proportion of the number of applicants.

As a step towards the solution of this problem, the Ministry proposes, as part of its 6-year plan (which is now under the joint consideration of the Ministry, the Supreme Educational Council and the Cabinet), to establish 6 upper secondary agricultural schools and another 6 upper secondary industrial schools, 1 school of each type for almost every province. The Ministry also proposes to give an agricultural, industrial or commercial bias to the courses in a fairly large number of intermediate schools (the exact number has not yet been agreed upon) so as to make it possible for the more able graduates of these intermediate schools to continue their studies at the corresponding type of school—agricultural, industrial or commercial—at the upper secondary stage.

Until 1959 secondary education was accessible to all who reached that level of schooling, but the number of secondary school leavers increased to such an extent that the Government found itself unable to ensure employment for all of them. To meet this problem the Law of Education of 1955, which fixed the aims and duration of secondary education (Articles 15 and 16), had stipulated in Article 17 that the admission of pupils to the intermediate stage after passing the Primary School Certificate or equivalent examination was to be determined by their relative degree of success and the Ministry's ability to provide places. While Article 17 thus tended to limit the number of

possible entrants, this varied from province to province and in some cases ranged from 85 to 90 and even 95 per cent of the primary leavers.

In 1958–59 the Ministry promulgated a law providing that applicants who had completed the primary stage should also sit for a special entrance examination. This system was applied at the end of that year and the number of pupils admitted to the intermediate stage was reduced to 75 per cent of the total number of applicants.

In the same year (1958–59), the Ministry promulgated another law stipulating a similar examination—the General Intermediate Certificate examination—for pupils wishing to join class 1 of the upper secondary school after completing class 3 of the intermediate stage. This law will come into force as from the end of the 1959/60 school year.

At the end of 1959 the upper secondary course was extended from 2 to 3 years and provision was made for classes 2 and 3 to be divided into two sections, literary and scientific. New curricula have been laid down. The curricula and regulations concerning class 1 of the upper secondary stage were put into effect at the beginning of the school year 1959/60; those concerning classes 2 and 3 (including both the literary and scientific sections) will come into force in 1960/61 and 1961/62 respectively.

These various measures aim at ensuring that secondary school entrants shall be of good quality, and at raising the standard of the Secondary School Certificate examination, thus increasing the likelihood of success later at the university.

Administration

Control of secondary education is exercised by the Ministry of Education, which issues regulations governing the establishment of government schools, the organization of the various types of course, the appointment of teachers, curricula, examinations, choice of textbooks, school holidays, etc. The Ministry sees to the carrying out of regulations through its inspectorate, which comprises administrative and technical inspectors.

In each of the seven provinces into which the country is divided, the Ministry of Education is represented by an administrative inspector, who is the director of education for the province. The administrative inspector provides educational facilities either by establishing new schools or creating new classes in existing schools, informs the schools of all regulations and instructions issued by the Ministry, and reports to the latter on all matters concerning the work of the schools in his area. Headmasters of government schools are directly responsible to the administrative inspector. In carrying out his duties the latter has a staff of assistants who visit primary and intermediate schools in the area. He is also entitled to the co-operation of the officers in charge of the various local units of administration: the governor (*mutaṣarrif*) of the province (*liwā'*), the lieutenant-governor (*qā'im maqām*) of the region (*qaḍā'*), the head of the district (*nāhiyah*), and to the co-operation of the municipal or local council, the provincial engineer, the local medical officer, etc., on matters concerning the schools.

The technical inspectors have their headquarters at the Ministry of Education in Amman. Most of them (there are at present some 20 in all) are subject specialists, and there is at least one specialized inspector for each subject of the curriculum. They visit classes to assess the teaching and the standard of the pupils' work, and to study the suitability of the curricula and textbooks. They give advice to the teachers and report on their work; copies of these reports are sent to the teachers concerned. Technical inspectors also attend meetings called by the Minister of Education or the head inspector to discuss curricula, textbooks, etc., and make recommendations. They also co-operate with the administrative inspectors (provincial directors of education) in arranging in-service training courses, especially for new teachers, and examining the results of these courses.

While the foregoing paragraphs refer particularly to government schools, the Ministry of Education also exercises general control over private education. As regards curricula and examinations, the principal conditions under which private schools are allowed to operate have already been mentioned. On the administrative side, private agencies wishing to establish a school must obtain a licence from the Ministry of Education and furnish information on the sources of their finance. While completely free as regards internal administration, formation of classes and appointment of teachers, private schools are subject to the technical supervision of the Ministry of Education.

UNRWA operates 12 secondary schools in Jordan, with about 5,000 pupils. It has its own administrative system and administrative and technical inspectors, but it works along the same lines as the Ministry of Education and observes all ministry regulations regarding curricula, textbooks, etc.

Other Jordanian ministries running schools at secondary level usually have their own inspectors but use the curricula and textbooks prescribed by the Ministry of Education.

Finance. The State bears over 90 per cent of the expenditure on government-controlled education. In the Ministry of Education budget the most important items of expenditure are salaries of the ministry's administrative and technical staff and of teachers, cost of textbooks and stationery, rent of school buildings, pensions and educational missions abroad. Items which have shown a notable increase in the last 3 years include expenditure on educational missions abroad, on teacher training colleges and on technical education. Thus the increase in 1958/59 over the expenditure for the previous year was of the order of 15 per cent for teacher training colleges (which supply a large number of teachers for intermediate and upper secondary as well as primary schools) and of 17.5 per cent for technical education. The budget of the Ministry of Education as a whole has risen steadily over the last 20 years. Whereas in 1940 it did not exceed 100,000 dinars, it has now reached 2,931,301 dinars. The following table gives each annual budget of the Ministry during the past 7 years and shows what percentage this was of the state budget.

In addition to the allocation from the state budget to the Ministry of Education, there are certain other sources of educational revenue which do not constitute a part of the Ministry's budget.

Municipal Education Tax. Municipal councils in towns (and local councils in villages) collect from the people an

EDUCATION AND STATE BUDGETS 1952–58

School year	Budget of Ministry of Education (in dinars)	Percentage of state budget
1952/53	318 494	4
1953/54	385 566	7
1954/55	1 073 817	7
1955/56	1 270 521	7.1
1956/57	1 715 012	7.4
1957/58	2 114 600	7.2
1958/59	2 931 301	8.3

income tax not exceeding 3 per cent, called the Municipal Education Tax. Proceeds are spent on salaries of additional teachers required to bring the staff of the local school up to strength, the construction of new classes or playgrounds, etc. Expenditure of this sort must be authorized by the Municipal Educational Committee, which is headed by the local administrative officer and includes among its members the educational inspectors in the province and the head of the municipal or local council. Proceeds from the Municipal Education Tax in 1958/59 in all towns and villages throughout the country amounted to 250,000 dinars, i.e., nearly 10 per cent of the ministry's budget.

Village collections. Contributions are collected from the inhabitants of village which have no municipal or local councils. They are collected by the mayor, by permission of the local administrative officer who acts on the recommendation of the provincial director of education.

The 'School Fund'. Education is free in all government schools but token fees have been collected from pupils for the last few years as contributions towards the School Fund. The amount of these fees varies according to the class: in primary classes 1, 2 and 3, the pupil pays 150 milliemes; in primary classes 4, 5 and 6, 250 milliemes; and in intermediate and upper secondary classes, 750 milliemes. The ministry has recommended all school headmasters to take into consideration every pupil's financial ability and to exempt poorer pupils, on condition that the proportion of exempted pupils does not exceed 50 per cent of the total enrolment. The money raised is spent on library books, laboratory equipment, teaching aids, school societies (literary, scientific, social or athletic), etc., or is used to meet some urgent school need. Such expenditure is authorized by a committee of school teachers presided over by the headmaster. The ministry's permission must be sought whenever any single expenditure exceeds 5 dinars.

United Nations Relief and Works Agency. In some districts a number of refugee children, especially those at upper secondary level, are enrolled in schools coming under the control of the Jordanian Ministry of Education. The ministry receives from UNRWA $7 for each refugee child enrolled in a government primary school and $ 40 for each refugee pupil at a government intermediate or upper secondary school; the number of refugees who may attend government intermediate and secondary schools is limited to 5,000. This contribution does not constitute a part of the ministry's budget, but is kept in a special account. It is spent on salaries of temporary teachers, wages of additional caretakers, and free textbooks and exercise books.

Point Four. In 1959 Point Four gave assistance to the Ministry of Education worth $ 544,785 in the form of specialists, educational missions, books and school buildings.

United Nations Educational, Scientific and Cultural Organization. In the same year, Unesco provided assistance to the ministry worth $ 55,500 in the form of specialists, educational missions and equipment.

The Ministry of Defence earmarks about 88,100 dinars, i.e., 0.41 per cent of the Defence Budget, for its schools. Pupils normally pay a fee of 100 milliemes a year, but poorer pupils are exempt.

The Ministry of Social Affairs spends 65,935 dinars on its schools, i.e., 28.5 per cent of its budget. No fees are paid by the pupils, who also receive free textbooks, stationery, and free meals.

Buildings and equipment. At the beginning of 1959/60, there were over 1,500 schools throughout the country. Seventy per cent of these schools are run by the Ministry of Education which, however, does not own more than 70 per cent of the buildings of its own schools, the remaining 30 per cent being rented. Although the ministry's budget includes an item for rent of school buildings, construction and repair of school buildings belonging to the Government are the responsibility of the Ministry of Public Works.

In the past 5 years also, Point Four has built a number of teacher training colleges at Amman and Ramallah as well as a number of new buildings for the Khaduri Agricultural School at Tulkarm. The Ford Foundation gave about $ 250,000 to build the Rural Teacher Training College at Hawarah, Irbid.

Equipment in Ministry of Education schools (including furniture, books, stationery, laboratory apparatus and sports equipment) is supplied by the ministry itself and special allocations are earmarked for this purpose in the ministry's annual budget. Point Four and Unesco, however, have also helped to supply laboratory equipment and facilities for technical education.

School welfare services. The Ministry of Health arranges for all pupils to be medically examined once a year and provides free medical treatment to pupils and teachers alike.

Pupils who cannot afford to buy textbooks are lent them by the Ministry of Education.

TYPES OF SECONDARY EDUCATION

General secondary schools

Intermediate schools. After the successful completion of the 6-year primary school, pupils enter upon the intermediate stage of education which covers a period of 3 years (ages 14 to 16).

Intermediate school subjects are the same as for the primary stage, with the addition of 4 hours a week of technical training for boys and domestic science for girls. The time-table for each of the 3 years is as follows, with the number of periods per week in parentheses: religion (3), Arabic (6), English (7), arithmetic (2), geometry (2),

algebra (2), physics (3), chemistry (1), biology (1), history (2), geography (2), domestic training—girls (4), technical training—boys (4), physical education (2), library period (1); there is an additional period per week in the third year for civics.

The technical training in boys' schools may be either industrial, agricultural or commercial.

Industrial training, which is at present provided in about 30 schools, most of them situated in the principal towns, covers carpentry, blacksmithing, book-binding and straw and bamboo work. Training in weaving is available in one intermediate school only. Two hours a week are devoted to theoretical subjects (technology and drawing—geometrical and technical) and the other 2 hours to practical work.

Agricultural training, provided in 69 schools situated in villages and small towns, is likewise divided into 2 hours for theoretical teaching and another 2 for practical work.

Commercial training takes place in 43 schools; it comprises 2 hours a week for book-keeping, 1 hour for general commercial knowledge, and 1 for commercial correspondence.

Domestic training, which takes place in all girls' schools, is divided into 2 hours for homecraft training and another 2 for drawing and handicraft.

As was previously mentioned, the 6-year plan envisaged developing the industrial bias in a number of town schools so that the majority of leavers would be able to earn their living as semi-skilled workers, and the more able would continue their education at the projected industrial upper secondary schools. Similarly the agricultural bias would be strengthened in a number of village and small town schools in order to train the majority of leavers to earn their living as agricultural workers and enable the better pupils to continue their education at the projected agricultural upper secondary schools. The remaining intermediate schools are to continue their present general course which gives a general preparation for earning a living or qualifies leavers to enter the upper general secondary school. Girls' intermediate schools are to keep their non-technical character as a whole, but more interest is to be given to domestic training and also, in rural areas, to training in simple agricultural industries.

The organization of the school calendar is the same for all schools throughout the country. The school year begins in October and ends in June; it is divided into three terms with one mid-year vacation.

The school day is from 8.15 a.m. to 3.30 p.m., with a luncheon interval of 1½ hours and a break of 15 minutes at 10 a.m. On Thursday, however, the school day is from 8.15 a.m. to mid-day. The school week is from Saturday to Thursday, the weekly holiday being on Friday. The schools of Jerusalem, Bethlehem and Beit-Jālā, and Christian and foreign private schools, observe both Friday and Sunday as weekly holidays, but their working day during the rest of the week, including Thursday, is from 8 a.m. to 3.30 p.m.

Upper secondary schools. At present the upper secondary stage is a 2-year course but it will be extended to 3 years (ages 17 to 19) as from the school year 1961/62.

Curricula in almost all upper secondary schools are of a general character; the full 3-year programme, with differentiation into literary and scientific sections in the second and third year classes, is given below.

TIME-TABLE FOR UPPER SECONDARY SCHOOLS

(in periods per week; where there is a difference between boys' schools and girls' schools the time allotment for girls is given in parentheses)

Subject	1st	Literary section		Scientific section	
		2nd	3rd	2nd	3rd

Total	36	36	36 (35)	35 (37)	36 (37)

A Secondary School Certificate examination is held at the end of this stage. Pupils are required to pass in 5 subjects but they may choose to be examined in additional subjects, success in which is indicated on the certificate. National and foreign private schools also prepare pupils for the General Certificate of Education (England). Three private schools prepare for the Egyptian Secondary School Special Examination; the papers are set in Cairo and answers are also marked there. Successful candidates may enrol at the various colleges of Egyptian universities, subject to their passing at a sufficiently high level to satisfy entrance requirements. Schools run by the Jordanian Ministry of Defence prepare pupils for entry to the Military College or for upper secondary education leading to the Secondary School Certificate examination.

The Islamic Affairs Council supervises one secondary school which uses the same curricula and textbooks as do the Ministry of Education secondary schools. In addition, courses in Islamic religion and law are given in higher classes. This school is now known as the College of Sharī'a (Islamic Law) and it is intended to transform it into a 4-year university college.

Vocational and technical schools

Commercial schools. Six schools (in Amman, Irbid, Nablus, Ramallah, el-Karak and al-Khalil) provide commercial education at upper secondary level, and there are seven girls'

schools which give training in Arabic and English typing. In the first year of commercial secondary school the subjects taught (with the number of periods per week in parentheses) are: book-keeping (3), business management (1); commercial accounting (1), Arabic and English typing (3). In addition, the subjects of general secondary school are taught, except physics, chemistry and biology, making a total of 36 periods a week. In the second year, commercial subjects are: accounting and book-keeping (4), commercial practice and business management (3), commercial correspondence (2), commercial arithmetic (1), Arabic and English typing (2). The remaining 24 hours are allotted to general subjects.

In 1961 the six secondary schools containing commercial sections will have a 3-year course of general and technical subjects qualifying for university entrance. New curricula are being prepared.

Agricultural schools. All the pupils in these schools are boarders. *The Khaduri Agricultural School at Tulkarm.* The course lasts 3 years and is open to pupils who have completed the intermediate stage. The curriculum is wholly devoted to agriculture and covers both theoretical and practical training. The school extends as much help as it can to farmers in the Tulkarm and other areas by giving technical advice and offering for sale at low prices plants and seed which the farmers cannot produce for themselves. The school was the first organization in the country to succeed in increasing the production of olive tree shoots through the use of improved seed, thus enabling farmers to obtain a sufficient number of shoots at reasonable prices. The school has also established an agricultural research unit.

The el-Rubbah Agricultural School at the el-Rubbah village in the al-Karak province is an agricultural intermediate school controlled by the Ministry of Agriculture, and is open to pupils who have completed their primary education at government schools. The period of study is 3 years, followed by an optional fourth year. Pupils who successfully complete the first 3 years are granted the Intermediate Agricultural Certificate, which is equivalent to the third year certificate in government intermediate schools.

The el-Jubeihah Agricultural College, near Amman, is controlled by the Ministry of Agriculture. It was formerly an intermediate school like the one at el-Rubbah, but the Ministry of Agriculture has transformed it into a semi-university college with 4 years of study, the first 2 at upper secondary level and the following 2 equivalent to university study. The college is open to pupils who have obtained a very good pass in the third intermediate year with a mark of at least 70 per cent in mathematics and physics. The curriculum for the two upper secondary classes of this college resembles to some extent the course for the corresponding 2 years in general secondary schools, with the addition of certain agricultural subjects. In the remaining 2 years (university level) the curriculum is purely agricultural. Graduates are granted a Higher Diploma in Agricultural Sciences. The Ministry of Agriculture plans to expand this college so as to transform it into a full 4-year university college preparing students for the B.Sc. (Agriculture).

Industrial schools. The Amman Industrial School belongs to the Ministry of Education. Its 3-year course is open to pupils who have successfully completed the third intermediate year. All pupils are boarders. Apart from Arabic, English, mathematics, physics and religion (the syllabuses of all of which are similar to corresponding syllabuses in general secondary schools), pupils study drawing (geometrical and technical), industrial accounting and technology. Training is given in carpentry, automobile mechanics, electricity, soldering or plumbing, according to the pupil's choice. Apart from their school work, first-year pupils are given training at local factories during the summer vacation by special arrangement between the school and factory authorities.

There is also an optional fourth year, qualifying pupils to become technical teachers in primary and intermediate schools.

During the past two years the school, in co-operation with a number of local firms and factories, has provided special evening courses at its own workshops for local workers engaged in the crafts mentioned above.

Other vocational schools. These include a number of institutions run by the Ministry of Social Affairs. The Reformatory School for Boys, at Bethlehem, to which young offenders aged 9 to 18 are sent by juvenile courts for periods of from 1 to 4 years, and the Juvenile Welfare Institution, at Ramallah, for homeless boys aged 7 to 15 years who are committed to the care of the institution on the recommendation of social welfare workers, provide general education up to the level of the fourth year in government primary schools and also a certain amount of trade training (tailoring, carpentry, shoemaking, etc.).

The el-'Alā'iyyah School for the Blind at el-Bīrah admits pupils under the age of 18. In addition to a full primary education, from which pupils may enter ordinary secondary schools, the school provides training in a number of light crafts, such as the manufacture of baskets, brushes and chairs of straw or bamboo. They also receive training in typing and in Braille writing and reading. It is intended to create a secondary section for advanced technical training which would qualify the pupils to earn their living after leaving the school.

The Girls' Welfare Institution at Beit-Jālā receives not only girls convicted under the Juvenile Rehabilitation Law of 1954, but also any other girls of 12 to 16 years of age, who may spend a whole year there at the ministry's expense learning sewing, embroidery and needlework, housework and child care. There are also girls' clubs at Amman and Nablus open to impecunious girls who were unable either to join schools at all or to complete their education. Education up to the standard of the fifth year of government primary schools is provided, together with training in sewing, embroidery, needlework and housework. A daily lunch, clothes, textbooks and other school equipment are provided free.

The Islamic Orphans' School at Jerusalem, which is supervised by the Islamic Affairs Council, has a primary section and a post-primary section providing a 5-year course of industrial training in carpentry, upholstery, printing and book-binding, bamboo work or shoemaking, according to the pupil's choice.

The Salesian Fathers' School for Industry and Applied Arts, in Jerusalem, is open to pupils who have completed their sixth primary year. Fees are payable but there is provision for payment of half fees or complete exemption, according to the financial possibilities of the pupils. The period of study is 5 years, during which pupils receive general education together with training in fitting, lathework and blacksmithing, carpentry, tailoring, or shoemaking, according to the pupil's choice. The general subjects taught in all the 5 years are Arabic, English, mathematics, Italian, geography, physics, chemistry, drawing, technology and Christian religion.

The Qalandiya Industrial School, Jerusalem, is supervised by UNRWA. It gives training in building and plumbing; electrical wiring, cables, etc.; carpentry and blacksmithing; fitting and turning and auto mechanics; technical drawing, and radio and electricity; commerce; and land surveying. In each course, general subjects related to the craft concerned are also taught. The school is open to Palestine Arab refugee pupils who fulfil the various requirements specified above. All pupils are boarders and pay no fees.

The Lutheran Industrial School, at Jerusalem, is open to refugee pupils, preference being given to orphans; they must normally have completed the sixth primary year. The period of study is 3 years, during which teaching in a number of general subjects such as Arabic, English, mathematics and Christian religion (for Christian pupils) is coupled with training in either carpentry or blacksmith's work.

Out-of-class activities

These vary from province to province and from school to school, according to the efforts of the administrative inspectors (provincial directors of education) and of school teachers. They take the following form: (a) The election by the pupils, under the supervision of the school authorities, of special school committees, each of which has a member of the teaching staff as a guide and adviser. These committees include the sports committee, which is concerned with football, basket-ball, badminton, tennis, table-tennis, etc., the cultural committee, which arranges speech contests, debates and dramatic performances and publishes the school magazine, and the social committee whose activities include organizing excursions to places of interest. (b) School societies; these are still extremely limited, being confined to co-operative societies and to Friends' Clubs in the villages. (c) Boy Scouts and Girl Guides, in most secondary schools.

It is hoped that the various committees and societies in each school will develop into an independent students' union. The next step on this democratic path would then be a general union of students representing all schools.

TRENDS AND PROBLEMS

Like other underdeveloped countries, Jordan still suffers from the inadequacy of its administrative machinery. The Ministry of Education, although its organization has been greatly improved, still needs in particular a special department responsible for secondary education and a planning department. One result of the lack of these specialized departments is seen in the fact that intermediate and upper secondary education are still predominantly general in character. The 6-year plan to diversify education during these two stages into general, agricultural, industrial, commercial and home economics courses has already been referred to in this report.

Teacher training. Jordan also suffers from a shortage of qualified teachers, especially at the intermediate and upper secondary stages. The present provision for teacher training may be considered under two heads:

1. *Training before employment.* This is carried out by the following training colleges: the Men's Teacher Training College at Amman; the Women's Teacher Training College at Ramallah; the Teacher Training College at el-'Urūb, which trains men and women teachers for urban schools; the Rural Teachers' Training Colleges at Beit Heneina and Hawara, both of which train teachers for rural schools; the Khaduri Agricultural School at Tulkarm, where a special class has been established to train teachers of agricultural subjects; and the Industrial School at Amman, which similarly has a class for teachers of industrial subjects. In 1959/60, the Ministry of Education created a third-year class in each of the first two colleges and will create a fourth-year class in 1960/61; these extended courses will train teachers for secondary schools. The 6-year plan for education envisages the amalgamation of the el-Jubeihah Agricultural School and the Khaduri Agricultural School at Tulkarm into a 4-year agricultural college granting a university degree. Graduates will be qualified to teach in the upper secondary agricultural schools also envisaged by the 6-year plan.
2. *Training during employment.* The Ministry of Education first made use of this method in 1953/54, when nearly 200 men and women teachers were trained. The number has risen each year and nearly 3,500 teachers are estimated to have attended the special training courses in 1959/60.

Apart from teacher training courses inside the country, the Ministry sometimes send teachers for training courses abroad (Egypt, Lebanon, the United States of America, or Europe) for 1 year at least in most cases, at its own expense or with the help of grants from Point Four, Unesco, the United States Information Centre in Amman, the British Council or friendly governments.

Finance. Jordan will continue for some time to be dependent on foreign financial aid in balancing her annual budget. It is therefore not surprising that the budget of the Ministry of Education, though constituting nearly 8.3 per cent of the state budget, cannot meet all demands.

Curricula. Revision of the curricula of general education will be completed this year. When the diversification of intermediate and upper secondary education proposed by the 6-year plan is put into effect, new curricula will have to be drawn up for industrial, agricultural, commercial education and courses for girls.

Textbooks. All textbooks are by Jordanian authors. While the quality of these publications is fairly satisfactory, there is room for improvement both as regards content and literary style and also book production. Three years ago the Ministry tried to take over entire responsibility for the issue of textbooks but was unsuccessful, partly because it was not fully prepared for such a step and partly because of the obstacles raised by authors and publishers alike.

School buildings. A considerable number of present buildings fall short of the health and educational standards required. Libraries, laboratories, workshops and playgrounds are inadequate or almost non-existent in many secondary schools.

[*Text prepared by the Ministry of Education, Amman, in 1960.*]

STATISTICS

Population (mid-year 1958 estimate): 1,580,000.
Area: 37,301 square miles: 96,610 square kilometres.
Population density: 42 per square mile; 16 per square kilometre.

Summary of school statistics, 1953–57. In 1957/58 total enrolment in all schools was about 270,000 or 17 per cent of the population. It was distributed as follows: pre-primary education, 3.6 per cent; primary, 77 per cent; general secondary, 19 per cent; vocational education and teacher training, less than 1 per cent. The proportion of girls was 34 per cent in the primary schools, 20 per cent in secondary schools, and 34 per cent in teacher training colleges. Women teachers were about one-third of all teachers in the primary and secondary schools. Between 1953 and 1957, total enrolment increased by 23 per cent in primary schools, but more than one and a half times in secondary schools. Altogether the number of girls enrolled increased by nearly 50 per cent; this increase was especially notable in the secondary schools, where the number of girls nearly tripled in the 5-year period. (See Table 2.)

Examination results in secondary education, 1953–57. Between 1953 and 1957 there was a fourfold increase in the number of secondary school certificates awarded. The number of girls who received such certificates did not increase at the same rate, since girls received 21 per cent of the certificates in 1953 but only 16 per cent in 1957. The number of matriculation certificates also more than doubled between 1955 and 1957, but again the proportion of girls receiving such certificates showed a slight decline. The number of teacher training certificates awarded showed a slight increase between 1954 and 1957. (See Table 3.)

Educational finance, 1957/58. The budget estimate of the Central Government for 1957/58 (fiscal year beginning in April) showed 2,114,600 dinars for education, of which 95 per cent was for recurring expenditure, and 5 per cent for capital expenditure. The amount for recurring expenditure contains 2 per cent for administrative expenses, 71 per cent for salaries to teachers, etc., 9 per cent for other instructional expenditure, and 17 per cent for other purposes. (See Table 1.)

THE EDUCATIONAL SYSTEM

The aim of the educational system of the Republic of Korea is to create a democratic and cultured community. The fundamental principles on which the system is based are to be found in the Constitution, which lays down that all citizens shall be equal before the law and have the right to the fullest development of their capacities in all fields of political, economic, social and cultural life. Discrimination based on sex, religion or social position is expressly forbidden. In particular, Article 16 declares: 'All citizens shall be entitled to equal opportunities for education. The attainment of at least an elementary education shall be compulsory and free of cost to the student. All educational institutions shall be administered under the supervision of the State and the organization of the educational system shall be determined by law.'

The Education Law develops these principles:

'The aims of education must be carried out not only in schools or other similar institutions but in all phases of political, economic, social and cultural life, with specific emphasis on civic, science, vocational and teacher training' (Article 3).

'Education, under no circumstances, shall be subjected to political or individual (sectarian) prejudice; no religious education shall be given at a national or local authority school' (Article 5).

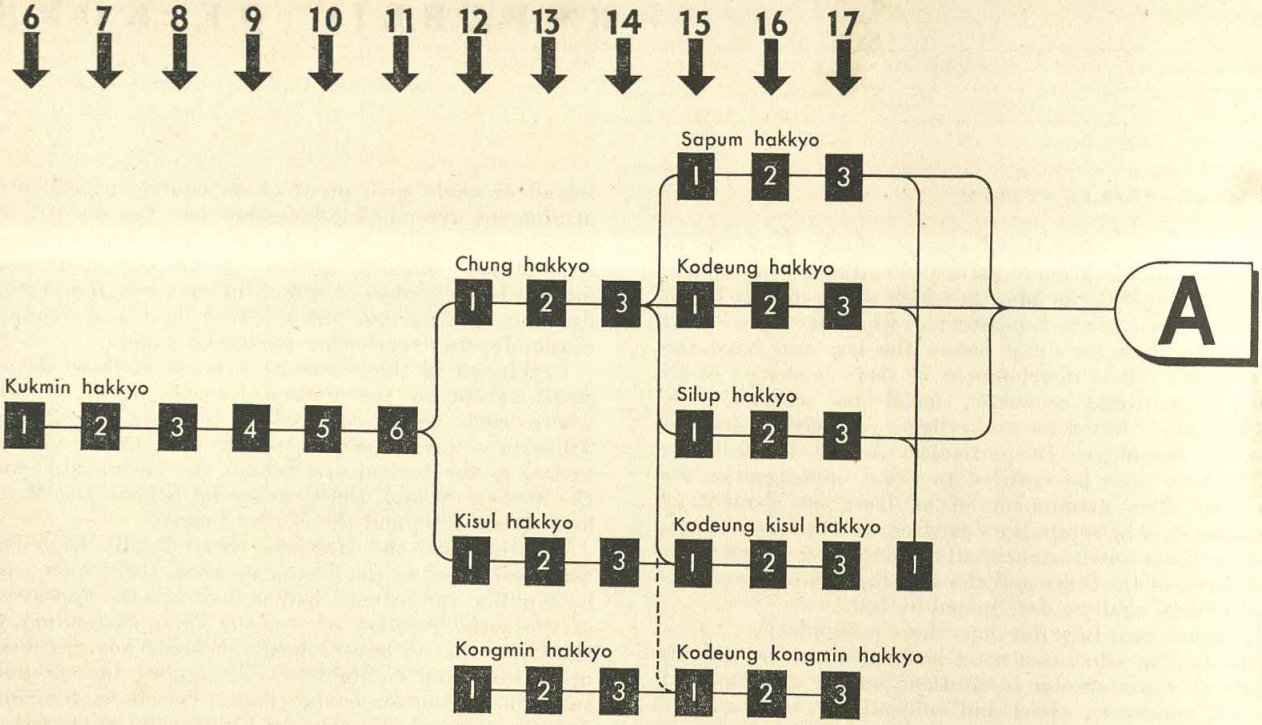
'Schools shall be established in accordance with the forms required by law and qualifications obtained by graduates of schools of the same type and level shall be uniform, whether the school be a public or private institution' (Article 7).

In order to guarantee equal educational opportunities for all citizens according to their capacities, both the national and local authorities are required to see that the establishment of schools be carried out with due regard to a suitable geographical distribution of the various types of school; that scholarships or other financial aid be made available to students of superior intelligence who have financial difficulties; and that informal night schools, seasonal schools or schools of a similar nature, be provided for persons who are in employment.

The structure of the school system may be seen in the diagram on page 760.

THE DEVELOPMENT OF SECONDARY EDUCATION

In the modern history of Korea, provisions relating to public secondary education were first set forth in Royal Decree No. 11, promulgated on 4 April 1899. This decree was revised in 1906 when a 4-year course for boys was introduced, to which a preparatory or supplementary course of less than 1 year might be attached. Boys above the age of 12 who had completed the regular primary school or could give proof of an equivalent educational attainment were eligible for admission. The revised decree prescribed the following subjects: morals, Korean language and Chinese classics, history, geography, mathematics, natural history, physics and chemistry, vocational studies, drawing, gymnastics, introductory law and economics, music, Japanese and other foreign languages.



Enrolment in the secondary schools of those days was small except in the normal (teacher training) school, where each pupil received a government allowance. Allowances were later also paid to students in such institutions as the Agricultural School, the Technical Institute, the Medical School, the Commercial School, the Meteorological Institute, and the Mining School.

In May 1908 the Hansong Girls' Public High School was established as the first of its kind. Girls' high schools, both public and private, had as their aim the improvement of the social position of women. Their curriculum, while similar to that in boys' schools, included home economics, needlework and embroidery, etc., among the compulsory subjects, and one foreign language, to be chosen from among English, German, French and Chinese, as an elective.

From 1900, various types of schools were established by religious foundations and by 1910 there were 19 secondary schools among 805 schools run by Christian organizations. These schools were, however, greatly handicapped by the lack of both qualified teaching staff and the necessary teaching aids and equipment.

Though they never accomplished as much as the secondary schools, the *sodang*, the small private teaching institutes located in every village, first set up by the Confucianists, played an important role in their several hundred years of history by bringing enlightenment to the people in remote areas where no secondary schools existed but where the people continued to study the Chinese classics. Until they were suppressed, the *sodang* played a noteworthy role in keeping the people conscious of the importance of learning and in stimulating patriotism when the country was under foreign rule.

For 36 years following the fall of the Yi dynasty, Korea was under Japanese administration. During this period the declared aim of secondary education was to give opportunities for promising Koreans to become leading members of the middle class and, at the same time, loyal citizens of the Japanese Emperor. The main subjects of the secondary school curriculum were morals, the Japanese language, Korean language and Chinese classics, history, geography, mathematics, natural science, drawing, music, gymnastics and English. The subject of vocational studies, covering such activities as agriculture, commerce and handwork, was added in order to put emphasis on respect for physical work, and brush-writing was included to meet the practical requirement of everyday living. In the latter part of the 1930s the teaching of the Korean language was stopped, and after 1941 English and other foreign languages

GLOSSARY

chung hakkyo (middle school): lower general secondary school.

kisul hakkyo (technical school): lower vocational training school preparing for various trades.

kodeung hakkyo (high school): upper general secondary school.

kodeung kisul hakkyo (higher technical school): upper vocational training school for various trades with courses of from 1 to 3 years' duration, and sometimes a 1-year post-high school course in major departments.

kodeung kongmin hakkyo (higher civic school): part-time school providing general education for young people and adults.

kongmin hakkyo (civic school): part-time school providing general education for young people and adults.

kukmin hakkyo (elementary school): primary school.

sapum hakkyo (normal school): teacher training school.

silup hakkyo (vocational school): vocational secondary school of agriculture, commerce, fisheries or home economics or technical high school.

HIGHER EDUCATION

A. University, college, or junior college.

were excluded from the secondary school curriculum. Japanese became the sole medium of teaching, and morals and the Japanese language the chief subjects.

After the Liberation in 1945 it was possible to set about educational reconstruction so as to meet the requirements of the Korean people. In December 1948, following the establishment of the Government of the Republic of Korea in August of that year, the Education Law was promulgated. It provided for 6 years' compulsory education and confirmed the establishment of the 6-3-3-4 system[1] which had already been introduced under the administration of the United States Military Government. However, the new system was not developed fully owing to financial difficulties, and there was also the heavy blow of the Korean war.

Despite all difficulties, secondary education in Korea developed considerably. The curriculum is varied, and adapted to the needs of the community and of the student. The ratio of general to vocational secondary schools, 3 to 7, is well fitted to the nation's present-day requirements.

Legal basis

The aims and nature of the education provided in the various types of secondary school are prescribed in the Education Law (Articles 100–37). The substance of the principal articles is covered by information given in the section on 'Types of secondary education'.

1. Six years of primary school, 3 of middle school, 3 of high school, and 4 of college.

Administration

Administratively, Korea is divided into provinces, and the provinces into districts and cities; Seoul, the capital, is classified as a 'special city' and has the administrative status of a province.

Secondary schools may be established and operated by a local authority (district or city), the special city of Seoul, or by a provincial authority, or they may be established and operated by a body with juridical personality (corporation) or any private person in accordance with provisions set forth in the related laws. Secondary schools are primarily under the control and supervision of the education committee of the special city or of the provincial government and subsequently of the Minister of Education. There are also institutions at secondary level maintained by the central authorities and known as national schools, all of which come under the direct control and supervision of the Minister of Education.

The Central Board of Education advises the Minister of Education or the provincial governors on important matters including the enactment, revision or repeal of orders relative to the administration of education, major aspects of educational policy, financial support of education and budget appropriations, policy concerning the professional staff of schools, international exchanges in the field of education, requests or petitions on matters submitted by educational committees of lower level, etc.

Courses of study and the required textbooks or teaching aids are prescribed by the Ministry of Education, through its Bureau of Textbooks, and the Ministry specifies a maximum and minimum of class periods per week and year. Principals of secondary schools are required to organize the individual study programme of the day, week, season, term and year in accordance with the directives of the Ministry.

In general, Korean language textbooks called 'national textbooks' are prescribed for elementary schools and civic schools. For middle and high schools, normal schools, higher technical schools and higher civic schools, the school administrators may select textbooks from a list issued by the Ministry of Education.

Control. The Minister of Education exercises general control and supervises all phases of administration relating to education, science, technology, art and other cultural fields. Matters relating to secondary education are dealt with by the secondary education section of the Ministry's Bureau of Common Education. As explained above, direct control and supervision of secondary schools are the responsibility of the provincial and special city authorities, the executive agency of each provincial government being its bureau of educational and social affairs. While headmasters of secondary schools are primarily responsible to the provincial governor or the superintendent of schools in Seoul, they are at the same time in close administrative relationship with the Ministry.

Supervision and inspection. The qualifications for appointment as a junior supervisor of secondary education are a college education and at least 3 years of teaching experience, or 5 years' experience in educational administration. The qualifications for senior supervisor are either (a) at least 5 years' experience as junior supervisor, or (b) college education and at least 5 years of teaching experience, or 7 years' experience in educational administration, or (c) a pass in the government examination for senior staff in educational administration, together with 3 years or more of teaching experience. Senior supervisors are appointed by the President on the recommendation of the Minister of Education; junior supervisors are appointed by the Minister of Education.

As a matter of educational policy, all supervisors are required to work in groups. Among their duties are the inspection and supervision of the course of study; the comprehensive planning of educational policies; the study and application of administrative regulations on education; planning the establishment or discontinuance of schools; supervision of government personnel in educational agencies; and supervision of the use of textbooks and other teaching aids.

Parent-teacher association committees are also active in helping to achieve the aims of education by improving the status of students and teachers and the environment in which they work.

Finance. In principle, the special city or the provincial government is responsible for the maintenance of public secondary schools, but when these local authorities have budgetary deficits, the National Treasury is bound by law to make up such deficits by the payment of subsidies. As however the Central Government cannot afford to support all the public secondary schools (owing to financial difficulties such as those caused by the aftermath of war), it is the parents who at present bear the main burden of the cost of secondary education.

In secondary schools run by voluntary educational agencies, fees are charged. Attempts have been made by the Ministry of Education to limit the fees in conformity with the ideals of equality of educational opportunity.

Normal schools—18 in number—are operated by the National Government. Students are exempted from paying fees, and scholarships are available.

Half the total amount of salaries of secondary school teachers is paid by the Government, and the other half by the special city or the provincial government.

Buildings and equipment. Basic standards regarding the building and equipment of the middle and high schools and of the normal schools are set forth in Ministry of Eduction ordinances. School buildings are required to last for at least 30 years. They must have adequate classroom accommodation, including special rooms for science, music, art and extra-curricular activities, a library (space for at least 300 volumes for every 3 classrooms), an auditorium, a dispensary, offices for the principal, the staff and administrative services, and accommodation for caretakers. There must be a water supply, sanitation and fire-fighting equipment. Standards are also prescribed for classroom lighting and special measures must be taken in this respect for night schools. The following are required to be attached to school buildings where possible: school farm, workshop, gymnasium (area of 54,000 square feet in schools with up to 500 pupils, and an additional 72

square feet for each student over 500), meeting room, dormitory, dwelling for teaching staff.

In reality, Korean secondary schools have still far to go to reach the standards set forth in the Ministry's ordinances.

School welfare services. A school doctor conducts an annual physical examination of the pupils, and many secondary schools have set up dispensaries. Among other facilities, many schools have a dining hall, barber's shop, shoe repair shop or stationery shop to provide cheaper services than the students can obtain elsewhere.

TYPES OF SECONDARY EDUCATION

The 6-year period of secondary education enrols pupils at the level of grades 7 to 12. Secondary schools are divided into four types:

1. Middle schools and high schools. The middle school provides a 3-year course based on the 6-year elementary school and leads to the 3-year high school. The latter may be a general or academic high school or a vocational or technical high school.
2. Normal schools. The 3-year course, based on middle school education, trains teachers for primary schools.
3. Technical schools and higher technical schools. These schools, which are to be distinguished from the technical or vocational high schools mentioned under (1), provide trade training courses of from 1 to 3 years' duration. Pupils who have successfully completed the primary or the civic school (a 3-year course for young people who are over the compulsory attendance age but who have not had a primary education), or have an equivalent capacity, are eligible for admission to technical schools; those who have graduated from the 3-year course at a middle school or a technical school or have an equivalent capacity are eligible for the higher technical school.
4. Higher civic schools. These institutions provide a 1 to 3-year course of civic and social education for adults. Normal schools and most other secondary schools are full-time day schools although some of the latter are night schools.

Specialized schools include the Art High School, Health School, and the School for the Deaf and Dumb. The Art High School has departments of music, arts and ballet.

In choosing a type of secondary schooling, parents of prospective candidates for entrance to middle school seek the advice of the elementary school teachers; at the level of selection for high school there may be discussions in which all three parties concerned participate—pupil, parents and teacher.

All types of secondary schools are intended to provide a terminal education, although the full 6-year secondary course is also of an intermediary nature inasmuch as it leads to higher education. Thus junior colleges (2-year post-secondary) including junior teachers' colleges, and colleges and universities with 4 or 6-year courses, including senior teachers' colleges, are open to high school graduates. Graduates of the normal schools may go on to teachers' colleges of junior or senior level, but the possibilities of their continuing their studies in other institutions of higher learning are restricted.

The school year begins on 1 April and ends on 31 March. It is divided into two terms, the first running from 1 April to 30 September, and the second from 1 October to 31 March. Each school year consists of at least 230 days (170 in the case of higher civic schools). School is open for 6 days per week except for national holidays or other holidays of a special nature. Summer and winter vacations are usually from the end of July to the end of August and from the end of December to the end of January respectively. Other special vacations are for short periods, such as a 6-day vacation at the end of the school year, or the holidays taken by schools in rural communities.

General secondary education

Middle schools and academic high schools. Owing to the limited number of places available and the differences in quality between schools, entry is highly selective. There are three methods of selection in practice at the present: (a) using information furnished by the elementary school principals without imposing a written examination; (b) common entrance examination set by a number of secondary schools in the same district; (c) separate examination set by each school. Entrance examinations are advertised by means of public notices, which specify the number of pupils to be admitted, the qualification for admission, the date of the examination, etc.

The aims of the middle school are: to extend the objectives of the primary school and to inculcate the knowledge and habits desirable for a responsible member of the community; to teach the basic knowledge and skills common to all occupations and improve the ability of the student to choose a vocation suited to his individuality; to improve the student's self-discipline both in and out of school and develop sound judgement; and to improve the students' physical well-being. Building upon this foundation, the high school seeks to improve the student's capacity to understand and form judgements about the nation and society, and his ability to plan and manage his own life.

In 1954, the Ministry of Education promulgated an ordinance establishing standard curricula and time-tables (see accompanying table). A class period in secondary schools is of 50 minutes' duration.

There is a research committee whose function is to study the improvement of teaching methods, with a sub-committee for each subject taught in secondary schools. In addition, model or experimental schools are designated by the Ministry of Education and provincial governments, for the purpose of carrying out research and studies.

Testing of school work including evaluation of the pupils' suitability for promotion to a higher grade is prescribed in the school regulations. Examinations of various types, such as by oral questioning, demonstration, or written test, are held as frequently as deemed necessary. Periodic examinations are held at mid-term and at the end of the term. A record of each student's career is kept, and a transcript sent to the parents or guardians. The form the record takes was prescribed by the Ministry of Education in 1956; it is required to cover physical development, behaviour, scholastic achievement, scores of standardized tests, extra-curricular acitivities, etc.

Provisions of the Education Law pertaining to the

STANDARD MIDDLE SCHOOL CURRICULUM

Extra-curricular activities	70 (2)	70 (2)	70 (2)
Grand total	1 190–1 365 (34–39)	1 190–1 365 (34–39)	1 190–1 365 (34–39)

qualifications required of secondary school teachers identify four categories:

1. Qualified Teachers Grade I: persons who hold the certificate of Qualified Teacher Grade II (secondary schools), who have had teaching experience of not less than 3 years and undergone the required in-service training conducted by the Ministry of Education.
2. Qualified Teachers, Grade II: (a) graduates of teachers' colleges (junior or senior level) or technical and academic colleges who have finished the course for the teachers' certificate with the required number of credit points; or (b) persons who hold the certificate of Assistant Teacher (secondary schools), who have had teaching experience for a specified number training conducted by the Ministry of Education; or (c) persons who are designated as qualified by the Central Examination Board for Secondary School Teachers.
3. Assistant Teachers: graduates of colleges or persons who are designated as qualified by the Central Examination Board for Secondary School Teachers.
4. Special Teachers: persons with special knowledge of vocational subjects, science, arts and health, who have been designated as qualified by the Central Examination Board for Secondary School Teachers. In addition, a school can hire a qualified health teacher as required.

The number of teachers required in a middle school, not counting the principal and assistant principal, is 3 for the first three classrooms; beyond that, no less than 1.5 teachers per classroom. In addition, vocational staff are required to be appointed in the ratio of 1 per classroom. In high schools, 3 teachers in addition to the principal and assistant principal are required for the first three classrooms; beyond that, the ratio is 2 teachers per classroom. In vocational high schools, for teachers of vocational subjects the ratio of 1 teacher to three classrooms is applicable. In this case the special teacher or health teacher is an exception to the ratio.

Higher civic school. This is an institution providing social education, and the national norms for area of study prescribed for regular secondary schools do not apply; the curriculum is more flexible than in the latter.

Vocational and technical education

Vocational or technical high schools. A high school in which more than 30 per cent of the curriculum is composed of vocational subjects is classified as a technical or vocational high school. Many are of the comprehensive type in which various departments are organized. Applicants for admission to institutions of technical and vocational education are selected in relation to the number of vacancies officially authorized in each department. Other conditions of entry are similar to those for middle school.

The following table shows curriculum requirements as between general and vocational subjects, in hours per year, with, in parentheses, the number of class periods per week.

General requirements include Korean language, social studies, mathematics, science, physical education, music, arts, military drill (for boys only), and extra-curricular activities similar to those of general high schools.

Subject	Grade		
	1	2	3
General requirements	875 (25)	595 (17)	525 (15)
Vocational requirements	315 (9)	385 (11)	385 (11)
Vocational electives	0–175 (0–5)	210–385 (6–11)	280–455 (8–13)
Total	1 190–1 365 (34–39)	1 190–1 365 (34–39)	1 190–1 365 (34–39)

The departments of the various vocational high schools are listed below.

Agricultural high school: agriculture, forestry, livestock breeding, agricultural civil engineering, sericulture, veterinary science, horticulture, farm products manufacturing.

Technical high schools: mechanical engineering, shipbuilding, electricity, applied chemistry, textiles, dyeing, civil engineering, architecture, mining, metallurgy, ceramics, mineral arts, woodcraft arts, mineral engineering, telecommunications, aviation, navigation, engines, printing, transportation management, locomotive operation.

Commercial high school: the commerce department teaches book-keeping, accounting, mathematics, principles of trading, commercial law.

Fishery high school: fishery, marine products manufacturing, propagation.

High schools of home economics: home economics, nursing and midwifery, public health, needlework, house decoration, beauty culture.

Technical and higher technical schools. These are trade schools, at middle and high school level respectively, offering courses of from 1 to 3 years. A 1-year course in a major department may be attached to the higher technical school for the purpose of giving a specific vocational training to high school graduates or persons of equivalent educational attainment. They are mainly private institutions established by factories and industrial concerns. Article 129 of the Education Law requires that the aim of technical schools and higher technical schools shall be to train students in the knowledge and skills needed in the daily life of the nation. Emphasis is placed on the following goals: discovery of the natural talents of the student; improvement of his creative capacities; development of interest in and understanding of national industry and trade; improvement of the student's capacity for economic management and industrial planning.

A specimen time-table for a 1-year course at a barber school, showing the number of 50-minutes class periods per year, is as follows: Korean language 42; music 42; social studies 42; sterilization 25; hygiene 84; public health 90; physiology 90; physics 63; communicable diseases 90; hair styling 180; calisthenics 21; practice 600: Total 1,369.

The Education Law provides that a technician's certificate may be given to the graduates of technical school or higher technical school by a Presidential decree.

Teaching staff in vocational education. Qualification for teachers in vocational and technical high schools is similar to that of general high schools, and higher technical schools to that of middle schools. However, the particular teaching subject is indicated on the certificate, for instance, 'Mechanical Department of Technical High School Teacher, Grade II, Measures similar to those noted in the case of middle and general high schools are taken to improve the methods of teaching and close contact is maintained with factories, farms, etc.

Teacher training schools

Subject requirements in normal schools for the education of elementary school teachers, expressed in class periods per year, are as follows. The number of periods per week is given in parentheses.

Subject	Year		
	1	2	3
Korean language	140–175 (4–5)	105–175 (3–5)	70–175 (2–5)
Social studies	105–175 (3–5)	105–140 (3–4)	70–105 (2–3)
Morals	35 (1)	35 (1)	35 (1)
Education	—	315–420 (9–12)	—
Teaching practice	—	350–420 (10–12)	—

The evaluation of scholastic achievement and keeping of student records are carried out in the same way as at general secondary schools. A teacher's certificate issued by the Minister of Education is given to the graduates together with the school diploma.

Out-of-class activities

All middle and high school students belong to the National Student Defence Corps which was organized by Presidential decree for the purpose of promoting and administering student government and cultural, sporting and social activities. The general aim of the Student Defence Corps is to foster a good national spirit, and to maintain school discipline by developing the students' self-control and their ability to solve their own problems. There is a central organization which controls the provincial branches, under which come the school units. The Student Defence Corps in each school is under the leadership of the principal, with the teaching staff forming an advisory group. The steering committee is the Student Council, whose chairman and vice-chairmen are elected by democratic vote. Organization may vary from school to school; the school branches are supported through fees collected from students.

TRENDS AND PROBLEMS

The number of schools has increased enormously since the Liberation in 1945 and it is now imperative that their quality should be improved. A movement towards reorganizing general and vocational high schools into community-centred comprehensive high schools is in progress. There is an urgent need to raise the present normal school to the level of junior college; it is hoped to achieve this in the near future.

STATISTICS

Population (mid-year 1958 estimate): 22,505,000.
Area: 37,424 square miles; 96,929 square kilometres.
Population density: 601 per square mile; 232 per square kilometre.

Summary of school statistics, 1953–57. In 1957/58, total enrolment (not including some 677,000 persons in adult education classes) was nearly 4.5 million, being about one-fifth of the total population. Of these pupils, 79 per cent were in kindergartens and primary schools, 16 per cent in middle and high schools, 3 per cent in vocational schools, and 2 per cent in higher education. The proportion of girls was 44 per cent in primary schools, 24 per cent in secondary schools, 5 per cent in vocational schools, 37 per cent in teacher training schools, and 13 per cent in higher education. Women teachers made up 20 per cent of the teaching staff in primary schools, and 8 per cent in general secondary schools. The average pupil-teacher ratio was 62 for the primary schools, 35 for middle schools and 32 for high schools. Between 1953 and 1957, primary school enrolment encreased by 56 per cent, and secondary school enrolment by 50 per cent. (See Table 1.)

Enrolment trends in secondary education, 1945–57. Comparable data are not available before 1945. Since then enrolment has increased rapidly in all categories of secondary education. In general secondary education, total enrolment in 1957 was more than double that of 1949 and more than five times as high as in 1946. Vocational school enrolment increased more than four times between 1945 and 1957, and teacher training schools nearly doubled their enrolment during the same period. The average total enrolment at the secondary level, which was about 287,000 for the 1945–49 period, increased threefold to about 847,000 for the period 1955–57. For the latter period the average total enrolment represented about 38 per cent of the estimated population 15–19 years old. (See Table 2.)

Examination results in secondary education, 1953–57. The number of leaving certificates granted in 1957/58 was about twice as high as in 1953/54, for each type of certificate or diploma except that of the agricultural and fishery schools. Girls received 24 per cent of the middle school graduation certificates in 1957, and 27 per cent of the high school certificates. (See Table 3.)

Educational finance, 1959. For the fiscal year beginning in January 1959, the budget estimate for educational expenditure from the National Treasury amounted to 65,290 million hwan, or an average of 2,855 hwan per inhabitant. This amount was covered by receipts from the Central Government (92 per cent), provincial governments (5 per cent) and local authorities (3 per cent). Recurring expenditure on education accounted for 84 per cent of the total. An amount of 1,135 million hwan (1.7 per cent) was included for cultural activities. (See Table 4.)

NORTH KOREA

THE EDUCATIONAL SYSTEM

During the period of Japanese rule (1910–45) the educational system discriminated against Korean children both as regards access to schooling and the nature and quality of the teaching.

On liberation, steps were taken to abolish this colonial type of education and to introduce a new system meeting the needs of national construction and organized on a genuinely democratic basis. The North Korean Provisional People's Committee promulgated 'Regulations governing the North Korean school education system' which established a unified system covering general, technical and higher education. Active preparation was made for the introduction of a system of universal and compulsory primary education, and on 10 September 1949 the Supreme National Assembly of the Democratic People's Republic of Korea adopted an historic law fixing 1 September 1950 as the date for this step. The implementation of this measure was held up by the outbreak of war on 25 June 1950, but was finally achieved in 1956 on the successful fulfilment of the post-war three year plan.

The condition for the rapid development of social and economic relations was seen to be a rise in the cultural standards of the people and a further improvement in public education. In 1958, a universal 7-year system of education was introduced and the Supreme National Assembly passed a law providing for preliminary measures to be taken to introduce universal technical education.

Shortcomings had come to light in the public education system, especially as regards the complete secondary schools, and in October 1959 the Supreme National Assembly passed a law for the reorganization of the system to meet the demands created by actual local conditions.

All educational institutions are established and controlled by the State (private schools were abolished immediately after the liberation), and instruction in all of them is free, with equal rights for children of both sexes. Instruction is in the mother tongue, and is inseparably linked with socially useful labour.

As regards structure, the North Korean school system is at present in a period of transition. Up till the reorganization decided on in 1959 the pattern was as follows: kindergarten; a 4-year primary school; a 3-year lower general secondary stage, given in the 7-year incomplete secondary schools; and a 3-year upper general secondary stage given in the 10-year complete secondary schools. There were also 4-year *technicums*, admitting pupils from the 7-year school, and 2-year higher *technicums* admitting pupils with a complete general secondary education. *Technicums* as well as 10-year schools led to higher education.

Complete secondary schools, *technicums* and higher *technicums* are still provisionally in operation but they will accept no new pupils as from the beginning of the 1960/61 school year. As existing classes complete the course the schools will be progressively wound up and converted into new types of institutions known as technical schools and higher technical schools.

The new school organization, now being put into operation, comprises six successive stages: kindergarten; a 4-year primary school; a 3-year secondary school; a 2-year technical school; a 2-year higher technical school; universities and institutes, including facilities for post-graduate research. After completing technical school (9 years formal schooling), some pupils enter teacher training colleges (3–4 years) or the physical culture and sport school. There are also specialized schools (foreign languages, music, dancing, and art).

Primary, secondary, technical and higher technical education for workers is provided by part-time, evening and correspondence schools.

Today a total of some 2,500,000 persons are studying at 8,000 schools of various types and levels and 37 institutions of higher education.

THE DEVELOPMENT OF SECONDARY EDUCATION

The plan for the development of general and technical secondary schools is an integral part of the overall plan for the development of the national economy. The object is to carry into effect the law passed by the Supreme National Assembly in 1959 on the reorganization of the public education system, i.e., to ensure that all primary school leavers have access to secondary schools and to introduce universal technical education by 1962–63.

The Ministry of Education and Culture prepares the curriculum, syllabuses and textbooks on a uniform basis and organizes the work of collecting and disseminating information on successful teaching methods and theories. It also directs education and instruction through the agencies of the local authorities, which apply its policy and are immediately responsible for guiding and controlling educational work in the secondary and technical schools under their jurisdiction in accordance with the curriculum and syllabuses.

Each school is administered by a principal, who draws up the school work plan and organizes, checks and directs its application in accordance with the principles of collective leadership. All principals follow the state curriculum and syllabuses and conduct their work in accordance with the state regulations governing schools at all levels and the rules governing internal school arrangements. They also organize out-of-class and out-of-school work.

Each school has a pedagogical council, which acts as a collective consultative body and discusses such important matters as school government, the improvement of instruction and education, etc., and takes appropriate decisions.

There are also parents' councils, whose function is to assist the school in educating the children, and to see that the school, the family and society co-ordinate their efforts to bring up the rising generation.

Supervision and inspection. Attached to the Ministry of Education and Culture and the local people's committees are staffs of school inspectors, who constitute the state machinery for directing and supervising school work. The inspectors' task is to ensure that the policy of the Korean Workers' Party and the Government is duly carried into effect in the sphere of education, and they supervise the administration of schools, their educational work and the way they are run.

The trade unions, the Union of Democratic Youth and the Union of Democratic Women are closely linked with the schools through their subsidiary organs, and help in educational work with schoolchildren.

Finance. All educational establishments are run entirely by the State, which allocates the necessary funds to them from its budget. The allocations are made with due regard to the type of school and number of pupils, and in accordance with state standards. The finances for higher educational establishments and *technicums* are allocated by the Ministry of Education and Culture, and those for kindergartens and schools (from the primary to the complete secondary school inclusive) by the provincial, urban and district people's committees.

Teachers receive a considerably higher basic wage and more leave than employees in other professions. In addition, they receive a long-service increment averaging 20 per cent of the basic wage, as well as appropriate payment for work in excess of the set hours, extra pay for class leaders, etc. They are provided with free suits of clothes and overcoats, given 28 days' paid leave, they

qualify for holidays in rest homes and sanatoria, and group camping holidays and tours are arranged for them during the vacations at state expense.

In addition, village school teachers are provided with a kitchen garden and free fuel.

Teachers who are outstandingly successful in their work qualify for state bonuses, and for special services the State confers the title of 'Distinguished Teacher'.

All education is free, and students studying at higher educational establishments receive substantial grants from state funds. Those who have no guardian receive a special state allowance, and all their living and educational expenses are found. All pupils at every level and all university students are supplied with suits of clothes and overcoats at state expense, and spend their holidays at camps, where they are maintained by the State.

Buildings and services. The construction of school buildings is financed from state capital investments or, in the villages particularly, through the patriotic efforts of the local inhabitants.

The schools have adequate heating and lighting and conform to sanitation and health standards.

Every school has a dispensary. Those which provide hostel accommodation are equipped with baths, showers, washrooms, a hairdressing saloon, a dining-room and a shop selling school requisites and other articles.

The pupils, teachers and domestic staff are entitled to free medical attention by the school doctor.

TYPES OF SECONDARY EDUCATION

Under the new system of public education, secondary educational establishments will include (a) secondary schools, technical schools and higher technical schools, and (b) specialized educational establishments.

The school year begins on 1 September and ends on 31 August; it is divided into three terms in the general secondary schools and into two terms in the technical secondary schools.

Secondary schools

The purpose of the secondary school is to give pupils a general education and basic training in technical production, and to rear them in the spirit of communist morality and love of work.

The course lasts 3 years, and is open to pupils who have completed their 4 years' primary schooling; attendance is compulsory.

The curriculum includes humanistic studies and natural sciences, while physical and aesthetic education also bulk large. In addition, there is practical work in the school workshops and on the school experimental farm plots, where polytechnical instruction is given. In this way the pupils are drawn into socially useful work.

Their knowledge is tested and evaluated daily by the teachers, and there are also promotion and school leaving examinations. School tests, which may be oral or written, are marked according to a four-point system. The final examinations are conducted under the supervision of public education institutions and are uniform throughout the country so as to ensure that the pupils' knowledge is evaluated objectively and that they all fulfil the same requirements.

Technical schools

The pupils at these schools are trained in a particular speciality—mining, metallurgy, mechanical engineering, power production, chemical technology, transport, communications, forestry, printing, the textile industry, food technology, mass consumption foods technology, agriculture and fishing, public health, commerce, economics, art, etc.

Depending on their inclinations and abilities, pupils who have completed the secondary school course are entitled to enter whichever of the technical schools is most appropriate. The latter are controlled by urban and district people's committees, and are run in close conjunction with factories, industrial enterprises, farms, agricultural co-operatives and state institutions. They are distributed throughout the territory of North Korea in accordance with the economic nature of each region and the number of pupils (including the number of those not requiring hostel accommodation).

The curricula include both general and special subjects and practical work, their main object being to ensure that education shall be inseparably linked with productive work, and *vice versa.* Technical school leavers are eligible to work in the appropriate sector of the national economy or enter a higher technical school if they wish. As already mentioned, education at these schools is to be compulsory from 1962–63 onwards.

Higher technical schools

Under the reorganized public education system, higher technical schools will come into operation as from the 1960–61 school year, and will form the next step in the educational ladder after the technical schools. The technical school and higher technical school curricula are planned in such a way that the pupils receive a general education to at least the standard of the former 3-year upper secondary school, and at the same time a specialized technical education to a higher standard than heretofore.

Higher technical schools, which have a 2-year course, come under the direct control of the Ministry of Education and Culture, and train students for technical work in metallurgy, mechanical engineering, industrial chemistry, the chemical industry, light industry, agriculture and other sectors of the national economy. Leavers are eligible either to pursue their studies at one of the higher educational establishments or take up productive work in one of the sectors of the national economy.

Schools for workers

There are a large number of evening and correspondence schools where workers can take courses in their spare time. For example, the provisions for raising the standard of general secondary education and technical knowledge include a 3-year workers' secondary school, a 2-year

technical evening school and a 2-year higher technical evening and correspondence school. Pupils completing the courses at these schools receive the same diplomas as those at the corresponding day schools, and can continue their studies at higher educational establishments operating under the same system.

Specialized educational establishments

Apart from the schools already mentioned, there are specialized schools which provide an 11-year course of general education and specialized training in music, dancing art, or foreign languages. Some of the pupils on completion of the course will be able to continue their studies at an appropriate higher educational establishment.

The physical culture and sports school admits children of outstanding physical ability who have completed 9 years' schooling, and trains them to become specialists in this field. The course lasts 4 years. Some of the pupils who complete the course will be able to continue at a higher educational establishment in their special subject.

There are schools for war orphans, children of disabled ex-servicemen, blind and deaf-mute children, and workers' colleges where young workers and demobilized soldiers who have not had a normal general education are specially prepared for admission to a higher educational establishment.

The factories, farms and agricultural co-operatives offer short courses of vocational training for their workers, e.g., courses in tractor-driving and maintenance, farm machinery, veterinary science, etc.

Teacher training schools

The object of these is to train teachers for primary schools and kindergartens. They are divided into two sections—school and pre-primary and the course lasts 3 years. During their training the students are taught general subjects and are given teaching practice.

They are all trained at state expense, and on completion of the course may take up a teacher's post or enter one of the higher educational establishments. As from 1961–62 the teacher training schools (teacher *technicums*) based on the 7-year school are to be converted into teacher training colleges, with a 3- to 4-year course, for students who have completed the 2-year technical school (9 years' schooling).

The teaching staff in the schools, down to the primary schools and kindergartens, are to be supplemented by highly qualified and fully trained graduates of higher educational establishments. To improve teachers' qualifications, extension courses are organized in pedagogical institutes, teacher training colleges and schools in urban and country districts. Teachers are also encouraged to enrol at educational establishments providing correspondence courses, and examinations are arranged for them.

Out-of-class activities

These include study of the history of the Korean Workers' Party, club and group activities of various kinds, and participation in socially useful work, such as work in factories or co-operatives, promotion of public health and hygiene, etc.

TRENDS AND PROBLEMS

The main tasks of public education at the present juncture are to reorganize the existing public education system on a solid basis during the next 2 or 3 years, to consolidate the work done so far towards bringing the system of 7 years' compulsory education into being, and to lay the groundwork for the introduction of compulsory technical training.

There are also a number of other vital tasks flowing from the demands created by contemporary conditions (the rapid development of productive forces): the mass preparation of skilled technicians, a further rise in educational standards, the forging of closer links between school education and productive labour in schools at all levels, and more intensive training and re-training of teachers.

STATISTICS

Population (mid-year 1958 estimate): 8,000,000.
Area: 47,862 square miles; 123,962 square kilometres.
Population density: 167 per square mile; 65 per square kilometre.

In 1957 there were 7,230 kindergartens with approximately 300,000 children, 5,000 primary and secondary schools with 2 million pupils, and 221 vocational schools enrolling 65,000 students. There were in addition 16 higher educational institutions but the number of students enrolled is not available.

KUWAIT

THE EDUCATIONAL SYSTEM

Education became the responsibility of the State in Kuwait in 1936 when the first Board of Education was formed. Before that date, education was left to individual initiative and such schools as there were concentrated on religious instruction and teaching the rudiments of reading and writing. The first task of the new Board of Education was to modernize the educational system, and teachers were recruited from different parts of the Arab world to carry out the plan. Two primary schools for boys were opened in 1936/37, with a total enrolment of 600 and a staff of 26 teachers, and a girls' primary school was opened in the following year. Subsequent expansion has been spectacular. During the school year 1959/60 there was a total enrolment of 40,302 students (of whom 15,324 were girls) in the 103 schools of different types run by the Department of Education. According to a report prepared by a special committee appointed by Unesco to make a preliminary survey of the state of education in the Arab countries late in 1959, the number of schoolchildren enrolled in the first 6 grades of the Kuwaiti school system was 10,532 per 100,000 of population. This ratio compares favourably with that in some Western European countries where compulsory education has long been established.

The increase in the number of girls enrolled is noteworthy. In the school population taken as a whole, there are now 3 girls for every 8 students. The proportion of girls is higher in the lower grades, and in the first primary class there are almost as many girls as boys. There is good reason to believe that as the age groups move up the educational ladder this proportion will be maintained to the end of the intermediate stage, i.e., to the end of the eighth year of schooling.

As for methods and syllabuses, the original policy of the Department was to follow the system of one of the neighbouring Arab countries, adapting it to the circumstances prevailing in Kuwait. But the need was soon felt for a thorough investigation of the education requirements of the country. This inquiry was carried out in 1955 by Mr. Ismail Qabbani and Dr. Matta Akrawi, and their report has since been the basis for educational reorganization. One of their recommendations was that all children should be given an opportunity of completing the primary and intermediate course (8 years of schooling) as a step towards making this period of attendance compulsory. They also recommended that particular attention should be given to the education of women.

Almost all education in Kuwait is provided by the Government. There are only 4 private schools (with a total enrolment of 600 children) and these cater for the non-Arab communities. Education at all stages is free; no tuition fees are collected, and there are no charges for books and stationery or for the various school services which include the School Health Service and the provision of meals and clothing. The budget of the Department of Education for the financial year 1960 was estimated at about 150 million rupees for recurring expenditure.

Thus far, no financial problems have impeded the development of education. All school buildings are owned by the Government and many of them have been built recently and supplied with modern educational facilities. On the other hand the teaching staff is almost completely made up of non-Kuwaiti Arab teachers; of the 2,011 men and women teachers in 1959/60 only 109 were Kuwaitis.

The Board of Education is responsible for the general policy. The President of the Board is the Head of the Department, but the execution of policy is left to the Director-General, whose professional staff includes a Deputy-Director, 3 assistants, and a number of inspectors and supervisors. The inspectors and supervisors are usually in charge of the teaching of the different subjects in the school syllabuses and of other school activities.

Structure of the school system. There are at present four main types of school in Kuwait: pre-primary, primary, intermediate and secondary (both academic and vocational).

Pre-primary education is given in kindergartens, which accept children of both sexes between the ages of 4 and 6. The aim of education in a kindergarten is to provide young children with a healthy atmosphere where they can grow, acquire good habits and traits of character and observe objects in their surroundings through play and pleasurable activities.

Primary education starts at the age of 6 and lasts for 4 years. The aim of a primary school is to help the child to familiarize himself with his larger environment, teach him to read, write and calculate and provide him with the general knowledge he needs to prepare him for the next stage.

Intermediate education consists of a 4-year course following on from primary education. The aim of an intermediate school is to provide the children with further knowledge which may take them beyond their immediate environment, to explore their interests and aptitudes and guide them, as much as possible, towards the type of secondary education for which they are best fitted.

THE DEVELOPMENT OF SECONDARY EDUCATION

There are three categories of secondary education: general (academic), technical, and teacher training for women.

General secondary schools. Academic secondary education for boys was started in 1942 when some secondary classes were attached to one of the primary schools. In 1950 the two schools were separated and in 1953 the secondary school moved to its present premises, a boarding school on the outskirts of the city. In 1949/50 there were only 4

secondary classes, attended by 58 students; 10 years later, the numbers had risen to 43 classes and 1,280 students.

The girls' secondary school was also attached to a primary school when it first started in 1951; it attained independent status in 1954. The number of students has risen from 12 in 1951 to 393 in 1960.

Academic secondary education comprises a 4-year course open to graduates of the intermediate school. A general course is taken by all students during the first 2 years, after which they choose either the literary or the scientific section. The syllabuses are similar to those followed in the United Arab Republic, but with appropriate modifications particularly in the syllabuses of history and geography.

TIME-TABLE FOR GENERAL SECONDARY SCHOOLS
(in periods per week)

Subject	Year			
	1	2	3 and 4 (Literary section)	3 and 4 (Scientific section)
Religious instruction	2	2	1	1
Arabic	8	8	8	6
English	8	8	7	7
French	–	–	5	–
Social studies	1	1	–	–
History	2	2	3	–
Geography	2	2	2	–
History of philosophy	–	–	2	–
Elements of sociology	–	–	2	–
Mathematics	5	5	–	7
General science	4	–	–	–
Physics	–	2	–	3
Chemistry	–	2	–	3
Biology	–	–	–	3
Drawing	1	1	–	–
Handicraft or hobbies	2	2	2	2
Special studies	–	–	3	3
Physical training	1	1	1	1
Total	36	36	36	36

The 'special studies' in the last 2 years cover a variety of subjects of which the student has to choose one. In the literary section he may select a specialized course in either Arabic literature, English literature, history or geography. In the scientific section the choice is between mathematics, physics, chemistry or biology.

A public examination is held at the end of the secondary academic course. The Kuwaiti General Secondary Education Certificate awarded to the successful students is recognized as equivalent to its counterpart in the United Arab Republic. It qualifies holders for admission to most of the universities of the Middle East and, with certain reservations, to universities in the United Kingdom and the United States of America.

Technical school. The Technical School (known as al-Kuliyya as-Sina'iya in Arabic) was opened in 1954. It accepts students who have completed the third intermediate year and offers them a 4-year course in which they specialize in one of the following trades: fitting, turning, blacksmithing and welding, foundry, wireless and motor car mechanics, electricity, plumbing, carpentry and cabinet-making.

The syllabuses followed are similar to those of the corresponding technical schools in the United Arab Republic. The aim of the school is to create a class of skilled technicians who, if they show ability, may continue their higher studies at a university level.

Women's Training Institute. The Women's Training Institute was started in 1953 and has been attached since then to the Girls' Secondary School. It accepts girls who have completed their intermediate education, offers them a course of 3 years, which covers academic and professional subjects as well as practical training in teaching, and qualifies them to be class teachers in primary schools.

TRENDS AND PROBLEMS

The Department of Education has been at pains to stem the unqualified preference for academic education which is partly the result of deep-rooted social traditions. Success in this respect has been relative: there were only 192 students in the Technical School last year as compared with 1,280 in the Boys' Academic Secondary School. But it should also be borne in mind that when the Technical School was first opened, only 8 students chose to join it. At present, all graduates of the intermediate schools are entitled to enrol in the Academic Secondary School, but it is felt that the time will soon come when some kind of selection will have to be imposed.

Measures have also been taken by the Department to popularize vocational education. Special care has been taken to ensure that the buildings and equipment of the Technical School are not inferior to those of the Academic Secondary School, all Kuwaiti students are accepted as boarders, and they are given monthly allowances which are paid on graduation to help them make a start in business.

Secondary education is not sufficiently diversified. Plans have been made to open a Men's Training Institute, a Commercial Secondary School and a Marine School. It is hoped that these schools will help to solve the first problem discussed above.

There are only 3 Kuwaitis among the staff of 97 teachers in the secondary schools. Attempts have been made to attract greater numbers of Kuwaitis to the profession of teaching by granting special allowances and by making scholarships available for those who show the necessary aptitude.

Various social and economic factors have influenced the work of the students. The relative affluence of many Kuwaitis, and the high demand for qualified and semi-qualified Kuwaitis for business as well as for government service have, in many cases, tended to weaken competition and slacken zeal for serious study.

The very rapid social development which the society of Kuwait is undergoing has also left its impact upon many adolescents who find it difficult to adapt themselves to the demands of the rapidly changing social situation. The boarding section in the secondary school, which is open to all Kuwaitis, was intended as a partial solution to this problem.

STATISTICS

Population (mid-year 1958 estimate): 210,000.
Area: 6,000 square miles; 15,540 square kilometres.
Population density: 35 per square mile; 14 per square kilometre.

Summary of school statistics, 1953–57. Total enrolment in primary and secondary schools in 1957/58 was 28,151 pupils, representing about 14 per cent of the estimated population. There were in addition some 1,660 people attending evening commercial school and literacy classes. Of the school enrolment, 6 per cent were pupils in kindergartens, 89 per cent in primary schools, 4 per cent in general secondary schools and the remaining 1 per cent was divided between teacher training, vocational and special schools. Girls made up 38 per cent of the enrolment in primary schools, 16 per cent in general secondary schools and all the enrolment in the teacher training school. The teaching staff in all schools, excluding adult educational courses, numbered 1,542, of whom 41 per cent were women. In primary schools 40 per cent of all teachers were women, but there were only 25 per cent in general secondary schools. The pupil-teacher ratio in public primary schools was 19 in 1957/58 compared with 16 in 1953/54. In general secondary schools the pupil-teacher ratio was between 10 and 11 in both 1957/58 and 1953/54. Enrolment increased in public primary schools by 87 per cent over 1954/55 and in general secondary schools by 96 per cent over 1953/54. Enrolment in the technical school rose from only 12 pupils in 1954/55 to 154 in 1957/58. Girls training to be teachers trebled over the 3 years 1954–57. (See Table 2.)

Examination results in secondary education, 1953–57. Information available on examination results is incomplete. In 1957/58, 144 candidates, including 22 girls, were awarded the Secondary Education Certificate. In 1956/57, 100 candidates, of whom 17 were girls, passed the second part of the General Education Certificate, compared with 5 students passing the same examination in the year 1953/54.

Educational finance, 1957/58. Total expenditure on education in 1957/58 (fiscal year beginning January) was estimated in the Central Government budget at 145,291,382 Indian rupees representing approximately 699 rupees per inhabitant. Of this sum, 47 per cent was for capital expenditure. (See Table 1.)

LAOS

THE EDUCATIONAL SYSTEM

The preamble to the Constitution of 11 May 1947 (paragraph 4) imposes the following duties on Laotian citizens: service to the country, respect for the conscience of others, neighbourly behaviour, discharge of family obligations, diligence in work and in education, uprightness and respect for the law.

Since the entry into force of the Constitution, only one law on free and compulsory education has been promulgated: Law No. 12, of 9 April 1951, promulgated by Royal Decree No. 112 of 26 April 1951 and amended by Law No. 108 of 26 January 1952. The most important articles of this law are as follows:

Article 1. Elementary primary education in Laos shall be compulsory and free for Laotian children of both sexes from the age of 6. It may be provided either in public schools or in properly organized private schools.

Article 2 (*new*) (Law No. 108 of 26 January 1952). Any group of villages in which there are sufficient pupils to justify the establishment of an elementary school, and any *tasseng*, shall within the limits of the credits available be provided with a public elementary primary school. School attendance shall be compulsory for any village within 1 kilometre of a public educational establishment.

Article 3. All citizens within a radius of 5 kilometres shall be liable for the supply of materials and labour for the construction of the school.

Article 4. Any village with an elementary school shall be responsible at its own expense for the upkeep and maintenance of the school, its furniture and the teacher's lodgings.

Communication problems have made it very difficult to set up schools throughout the kingdom. A considerable part of the population is concentrated along the river Mekong and its tributaries and can more easily be reached by water than by land. Another part of the population inhabits the mountains or high plateaux; it is composed mainly of tribes and ethnic groups whose mother tongue is not that of the nation. These groups belong to civilizations whose origins and stage of development vary greatly. Some are still in the phase of nomadic agriculture and pastoral activities. Almost all the mountain and plateau people are fetishists, though the majority of the population—for instance, all the Lao and Lao-Thai groups—are Buddhists. Most of the people (probably over 90 per cent) are country folk. Technological and industrial development has begun to affect urban centres, but there are still very few such centres and their population is not large. As yet there are very few industries and little commercial activity of any importance. The country has an original and highly interesting culture and folklore of Indo-Buddhist type.

The need to use a foreign language as the medium of instruction in secondary schools, owing to the lack of Laotian teachers, has hitherto hampered the development of secondary education. At the stage of higher education, also, students must, for the same reasons, be sent to foreign universities and higher technical institutions.

Role of public authorities. General education (primary, secondary and higher) comes under the Minister of National Education, assisted by a Director-General who is represented in the provinces by regional inspectors.

The General Directorate at the Ministry of National Education comprises four Directorates: (1) Directorate of pre-school, primary, post-school and adult education; (2) Directorate of secondary education; (3) Directorate of higher education; (4) Directorate of teacher training.

Technical education comes directly under the General Directorate.

Each province (*khouèng*) is administered by the head of the province (*chaokhouèng*), and each district (*muong*) by a district head (*chaomuong*). The *chaokhouèng* represents the Government. He is in possession of the general instructions given by it in every field and sees that they are carried out. With this in view, he is responsible for taking all necessary steps to co-ordinate the various departments. The head of the province administers the national budget, at the local level. The *chaomuong* is a subordinate official who receives his instructions from the *chaokhouèng* and sees that they are executed.

Thus, where school administration is concerned, the *chaokhouèng* receives orders from the Ministry of National Education and transmits them to the regional inspector, who carries them out. These directives are obviously general in character, principally concerning the administration of the provincial education budget.

The regional inspector is responsible in the first instance to the head of the province and then to the Director-General of Education. All his correspondence, including the reports which he addresses to the Director-General, is accordingly marked 'Care of the *chaokhouèng*'. In the educational administration of his province, the inspector is in close contact with the *chaokhouèng*. For example, where the construction of public schools is concerned, it is the head of the province who takes the matter up with the Public Works Department; questions of school hygiene he refers to the chief medical officer of the province.

The same system of decentralization of power is followed in the districts administered by *chaomuongs*.

The Buddhist religious schools, where education is mainly of a religious type and covers in all a 10-year period, are placed under the Ministry of Public Worship. These schools had 4,937 pupils in 1958/59. This type of education has its own budget, which is administered by the Ministry of Public Worship.

Finally, there are private schools, most of which are directed by foreign missionaries; all these institutions are supervised by the Ministry of National Education, which has the right to inspect them. The teaching of the Laotian

language is compulsory in these schools. The Chinese school at Vientiane is the only one with secondary classes.

The structure of the school system is shown in the diagram on page 779.

THE DEVELOPMENT OF SECONDARY EDUCATION

Secondary education is a somewhat recent development in Laos. The first complementary course was opened at Vientiane in 1921; in 1924 the course was transformed into a *collège* (4-year lower cycle of secondary studies) and later became a *lycée* (full 7-year course). Secondary education really began to develop, however, only after 1946, with the opening of schools at Paksé and Luang-Prabang and at Savannakhet the following year (1947), at Xieng-Khouang in 1955 and quite recently at Saravane. In 1959, the Paksé and Luang-Prabang institutions became 'provincial education centres'.

A vocational school has been in existence at Vientiane since 1923; in 1938, it began to be called a 'workshop-school' (*atelier-école*). Other workshop-schools were founded later at Paksé, Savannakhet, and Luang-Prabang. In 1947, those at Vientiane and Savannakhet became apprenticeship centres. The Vientiane centre was converted into a technical school in 1953, and in 1958 these two institutions were attached to the *lycée* at Vientiane and the *collège* at Savannakhet respectively, becoming the technical sections of those schools. A commercial section was also started at Vientiane in 1958. On 1 January 1955, responsibility for technical education was transferred from the Ministry of Public Works to the Ministry of National Education.

A teacher training course was founded in 1947 and soon became a teacher training school with a 4-year course. In 1959, there was a further change of name; the teacher training school became the National Education Centre, which is intended gradually to train the whole teaching and administrative staff engaged in national education.

In Laos, secondary education comprises ordinary secondary teaching, with its classical and modern sections, teacher training and technical and commercial education.

Legal basis

The principal legislation governing or having some bearing on secondary education includes the following:

Royal Decree No. 164, providing for the creation of the Sisavang Vong University (30 June 1958).

Ministerial Order providing for the creation of the National Education Centre (4 March 1959).

Ministerial Order No. 142/PC, providing for the organization of the Centre for Legal, Political and Administrative Studies (13 March 1959).

Ministerial Order No. 166/PC concerning the founding, organization, functioning and administration of the Medical School (13 March 1959).

Departmental Circular providing for the the organization of studies in the technical sections (30 April 1959).

Ministerial Order No. 157 concerning the founding, organization and functioning of Provincial Education Centres (29 April 1959).

Ministerial Order No. 392/PC providing for the creation of the School of Artistic Craftmanship (26 October 1959).

Ministerial Order No. 391/PC providing for the creation of the School of Dancing and Music.

Franco-Laotian Convention on Education (13 April 1957).

Administration

At the Ministry of National Education, secondary education comes under the Directorate of Secondary Education which is directly responsible to the Director-General of National Education. A measure concerning the establishment of a committee on curricula and of a committee on textbooks for secondary education is now being considered. Apart from these bodies and committees, mention may be made of the Friends of Education, a body whose purpose is to disseminate information and to co-ordinate the assistance received from foreign countries; in principle, it meets every month. Until now, secondary schools have followed French traditions and have adopted the reforms introduced in France in regard to examinations and curricula.

Control. Head masters of secondary institutions have the title of *proviseur* (the *lycée* at Vientiane) or *directeur*. Pedagogically, secondary school heads fulfil the same function as in France. However, the provinces exercise administrative control through the *chaokhouèng* (provincial governor), who convenes all his division heads, including the principal of the *collège* and the regional inspector, at regular meetings. The regional inspector's duties as regards secondary education are still in the process of being defined. Technical education now forms part of the secondary system. The technical departments at Savannakhet come under the head of the secondary school, and those of Vientiane under the headmaster of the *lycée*. These links are administrative in character; technical direction is at present exercised by a Unesco expert.

The bonze schools are under the Ministry of Public Worship; the school at Vat Ong Tu, which is of secondary level, is directed by a monk.

The School of Dancing and Music and the Laotian School of Art are under the direct authority of the Ministry of Fine Arts.

The Chinese private school is inspected on behalf of the Ministry of National Education by an expert placed at the disposal of the General Directorate of National Education by the Asia Foundation. The same expert inspects also the other Chinese schools, which are primary institutions.

The country has no inspectors of secondary schools. French teachers are inspected by the competent French services, in accordance with Article IV, 4, of the Franco-Laotian Convention on Education. Such inspection is fairly frequent.

Committees of parents have been set up at the schools.

Finance. The expense of operating the secondary education system is charged to the national budget. Salaries of French teachers are paid directly by the French national budget. School supplies (books, textbooks, etc.) are provided in large measure through bilateral aid. The national budget meets the cost of maintenance of equipment and of buildings.

Every secondary school has a small operating budget allocated to it by the Ministry of National Education, and

is responsible to the Director of Secondary Education for the use made of these funds.

The technical sections have their own budget and have been equipped with machines and tools under arrangements for bilateral aid and under the Colombo Plan. The National Centre for Legal, Political and Administrative Studies and the Medical School have their own budgets and are responsible for their administration to the directors of secondary and higher education.

School building has hitherto been financed through foreign assistance (France, in the case of the *lycée* at Vientiane, the United States of America, in that of the National Education Centre). Provincial secondary schools are provisionally housed in premises belonging to the primary schools. The upkeep of school buildings is the responsibility not of the Ministry of National Education, but of the Civil Buildings Division of the Ministry of the Plan.

Laotian teachers are remunerated by the Ministry of National Education. Salaries range from 4,000 to 7,000 kips a month.

No school fees are charged, and textbooks are, in principle, supplied free to pupils.

Assistance in the form of scholarships is provided for children of poor families who go on with their secondary studies. The full scholarship is 1,500 kips a month.

School welfare services. Every school has a small dispensary and is regularly visited by doctors or nurses.

Teachers are given annual medical examinations. Pupils must present medical certificates on enrolment. There is regular medical supervision (X-ray examinations, diagnoses) in the course of each school year. Sick pupils receive free treatment at the municipal hospitals.

TYPES OF SECONDARY EDUCATION

Pupils who have completed their 6-year primary course may enter the modern or classical section of the *lycée* at Vientiane or of one of the *collèges* or provincial education centres, or else they may enter a technical or commercial section at Vientiane or Savannakhet, or the National Education Centre.

There is no guidance service to help pupils and their parents in choosing the type of secondary education which will best suit them. However, in order to ensure an even recruitment, sufficiently well-balanced as between secondary education of the classical type, technical education and teacher training, entrance examinations for the three types of institutions are held simultaneously.

At the end of their studies in the academic sections of secondary schools, pupils who have obtained their full *baccalauréat* can go abroad to study the various special subjects that are taught in institutions of higher education. Some go to France, and a smaller number to Thailand, Cambodia, Viet-Nam, the United Kingdom, Canada, the United States of America and Australia. A fairly considerable number of scholarships are generously granted by the Government and by foreign aid. The period of study for pupils in the technical sections was, in 1959, extended from 2 to 3 years. The Ministry of National Education intends gradually to bring these sections up, first to the level of the technical studies diploma and afterwards to that of the technical *baccalauréat.*

At the end of their 4-year course, the most promising graduates of the teacher training schools are often sent on scholarships abroad, especially to the primary and then the secondary teacher training schools of Thailand (Ubol, Udom, Bangkok).

The school year. In all secondary institutions, the school year now begins on 1 October and terminates at the end of June. It is divided into three terms. The pupils are given rather short holidays towards the middle and at the end of the first term, and longer holidays of about a fortnight for the Laotian New Year, at the end of the second term. Classes are held from Monday morning to Saturday noon, usually from 7.30 to 11.30 a.m. and from 3 to 5 p.m. Thursday is usually a holiday. During the hot summer season, there are generally no afternoon classes. As a general rule, each lesson lasts an hour.

General secondary schools

The only institutions of this type are: (a) the *lycée* at Vientiane, which prepares pupils for the French *baccalauréat,* with specialization in mathematics, in experimental sciences, or in philosophy; (b) the *collèges* at Thakhek, Savannakhet and Xieng-Khouang and the provincial education centres at Luang-Prabang and Paksé, where pupils prepare for the French *brevet d'études du premier cycle*

GLOSSARY

Centre national d'éducation (National Education Centre): training school for primary and secondary school teachers and educational administrators.

Centre national des études politiques, administratives et juridiques (National Centre for Legal, Political and Administrative Studies): institution training for careers in various branches of the public service.

centre provincial d'éducation: combined primary and lower secondary school.

collège: lower general secondary school.

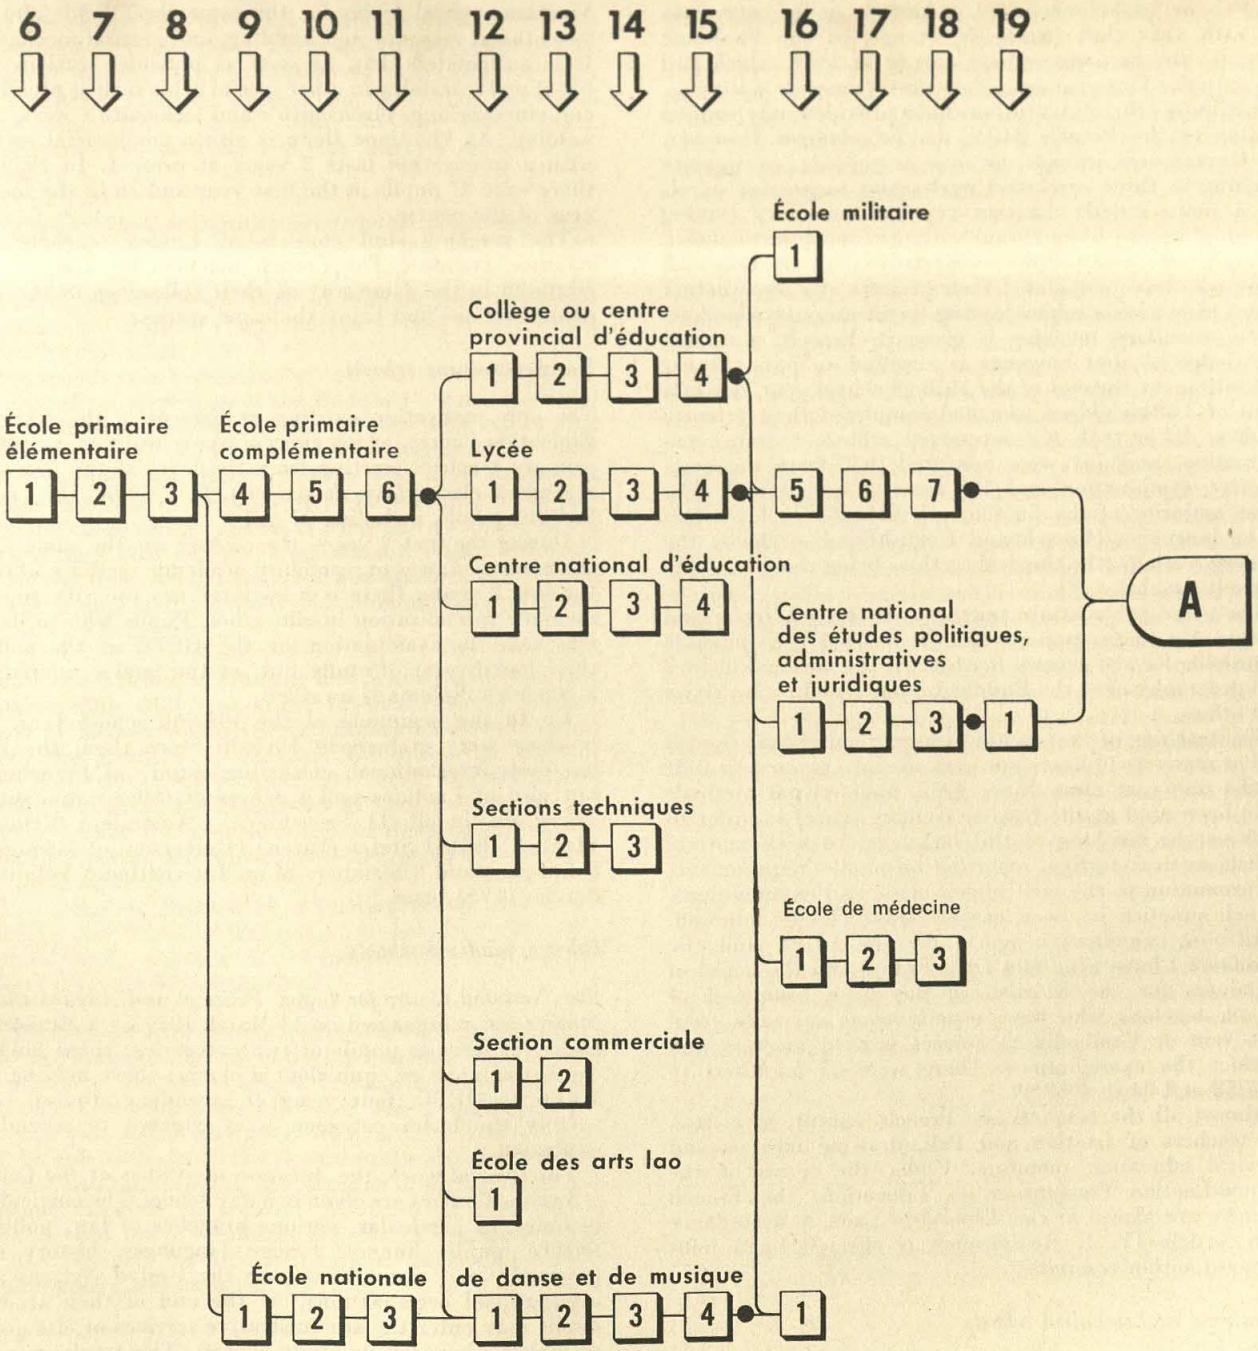
École nationale de danse et de musique (National School of Dancing and Music): vocational school covering primary and lower secondary stages.

École des arts Lao (School of Laotian Arts): vocational training school of local arts and crafts.

École de médecine (Medical School): vocational training school of medicine and nursing.

École militaire (Military School): vocational training school for careers in the armed forces.

école primaire élémentaire: lower primary school.



école primaire complémentaire: complete primary school.

lycée: general secondary school.

section commerciale: vocational secondary course of commercial studies.

sections techniques: vocational secondary courses preparing for various trades.

(BEPC) or lower secondary certificate or for entry into the fifth year class (*classe de seconde*) at the Vientiane *lycée;* (c) the Saravane *collège* opened in 1959, which still has only the first-year secondary class (*classe de sixième*).

Until now, these institutions have provided only courses leading to the French BEPC and *baccalauréat.* However, the Government intends, as soon as possible, to organize teaching in three successive cycles and to prepare pupils for a more strictly Laotian type of secondary leaving examination which would rank with the French *baccalauréat.*

Pupils are selected by competitive examination. All those who have completed their primary studies, whether or not they have a school-leaving certificate, may compete. Since secondary teaching is given in French, a certain knowledge of that language is required to pass the examination. At the end of the 1958/59 school year, out of a total of 3,884 children who had completed their primary studies, 1,778 took the secondary schools entrance examination, and 751 were admitted (628 from the competitive examination and 123 from a special list). The great majority of the Laotian pupils prefer to learn two living languages (French and English) and so choose the modern sections (the classical sections being those in which Latin is taught).

The same subjects are taught as in French *lycées* and *collèges.* Up to the present time, it has not been possible to provide for the general teaching of the national history and geography or of the Buddhist religion or Laotian civics and ethics.

The teaching of French has been particularly developed, and as many as 10 hours per week are now given over to it in the first-year class. Since 1958, audio-visual methods have been used at the teacher training school in order to improve the teaching of this language. In such matters as achievement testing, reporting on pupils' requirements for promotion to the next higher class, and examinations, French practice is, in a general way, closely followed. Until now, examination papers for the BEPC and the *baccalauréat* have been sent from France and the board of examiners for the *baccalauréat* has been composed of French teachers who have usually come specially from Viet-Nam or Cambodia to correct written answers and conduct the examinations. There were 25 *bacheliers* in 1957/58 and 24 in 1958/59.

Almost all the teachers are French, except, of course, for teachers of Laotian and Pali, drawing masters and physical education monitors. Under the terms of the Franco-Laotian Convention on Education, the French teachers are placed at the disposal of Laos, in accordance with Article IV, 1. Recruitment is effected by a joint Franco-Laotian committee.

Vocational and technical schools

The technical sections of the secondary schools at Vientiane and Savannakhet now give 3-year courses. A considerable portion of the pupil's time is passed in the workshop. Contacts have been established between these institutions and the few industrial and commercial undertakings in the country. The Savannakhet school has, up to the present, prepared pupils for three special fields: electricity, cabinet-making and carpentry, and automobile mechanics. The Vientiane school trains for the same three fields and for two others: masonry and building, and general mechanics. It is anticipated that, as soon as possible, sections will be set up for training in other special fields such as plumbing and zinc-working, blacksmith's and locksmith's work, and welding. At Vientiane there is also a commercial section with a course that lasts 2 years at present. In 1959/60, there were 37 pupils in the first year and 36 in the second year of the course.

The teaching staff consists of French teachers and Laotian monitors. The French teachers are trained and recruited in the same way as their colleagues in the academic sections and enjoy the same status.

Teacher-training schools

The only institution existing at present is the National Education Centre, which gives a 4-year training course for primary teachers starting from the level of the first-year secondary class (*classe de sixième*). In 1959/60, the Centre had 362 pupils, including 77 girls.

During the first 2 years, the courses are the same as in the modern classes of secondary academic sections. During the last 2 years, there is a common stream with supplementary specialization in education. Pupils who so desire may take the examination for the BEPC at the end of their fourth year of study but, at the final examination, a teacher's diploma is awarded.

Up to the beginning of the 1959/60 school year, the teachers were exclusively French. Since then, the staff has been international, consisting mainly of Frenchmen, but also of Laotians and teachers of other nationalities. There are, in all, 11 Frenchmen, 1 Australian (Colombo Plan), 3 United States citizens (University of Michigan), 3 Laotians and 8 members of an International Voluntary Service (IVS) team.

Other specialized schools

The National Centre for Legal, Political and Administrative Studies was reorganized on 13 March 1959 by a Ministerial Order. It recruits pupils of two categories: those holding the *baccalauréat* or equivalent diploma; those holding the BEPC or DEPC (four years of secondary studies).

Only the latter category is of concern to secondary education.

For this category, the duration of studies at the Centre is 3 years. Courses are given in a day school. The curriculum includes, in particular, various branches of law, political science, public finance, foreign languages, history and geography and also a course on the United Nations and international organizations. At the end of their studies, pupils may enter the administrative services or else go on to higher education or study abroad. The teaching body consists of foreign advisers attached to various ministries, members of the technical assistance staff (United Nations and Unesco), French and United States teachers and a Laotian director.

The Medical School was officially founded on 13 March 1959. It is a day school whose purpose is to train male and female nurses and midwives, medical aides and doctors of medicine.

At present, it has 10 pupils in the first year, 11 in the second and 10 in the third. There are 10 girls amongst the pupils. It has not yet been possible to open the university-level section, and the present pupils are all from the BEPC and DEPC level. Most of the teachers are French military doctors, and the director is a French doctor.

The Higher School of Bonzes recruits bonze pupils who have completed 6 years of study in one of the bonze schools. This institution is located at Vat Ong Tu. It gives an almost entirely religious type of training and comprises 4 classes, one of which is a preparatory class. In 1959/60, it had 82 pupils in all.

The school year begins at the end of June, and holidays correspond to the periods of the Buddhist religious festivals of the country. Sunday is a day of rest. The school year terminates at the end of March or the beginning of April.

The teachers are mainly bonzes who have studied in foreign religious universities; for the teaching of secular subjects, there are a Laotian teacher and two teachers of English (one Thai and one Englishman). Pupils who have completed their studies may become teachers in religious schools or may continue their education abroad (in Burma, Ceylon or Thailand).

The National School of Dancing and Music (*Matasinh*) now accepts pupils who have either taken the upper primary course or have completed their primary studies in schools under the Ministry of National Education. In 1959/60, there were 20 pupils at secondary level. The traditional dancing, music and dramatic art of Laos are taught. The curriculum also includes certain general education subjects (French, English, arithmetic, geometry, geography, history, science, hygiene).

This school is directed by a Laotian artist, and all the teachers are likewise Laotians. A boarding school is planned and, pending its construction, needy pupils receive government scholarships.

The *Laotian School of Art* is a school of artistic craftsmanship and was founded only recently (26 October 1959). It had 40 pupils in 1959/60. A single Laotian teacher, who provides all the teaching, is its director. The school is intended to train (a) skilled craftsmen who, after full instruction, will be able to assist in the revival of the artistic traditions of the Laotian people; (b) artistic designers who can become talented decorators; (c) drawing masters for primary and lower secondary schools. A boarding school is also planned for this institution; meanwhile, needy pupils receive scholarships.

Out-of-class activities

Secondary school pupils generally like sports and, in particular, football, badminton, tennis and basket-ball. Team sports are specially encouraged by the physical education monitors who take pupils regularly to the playing field. Various efforts have been or are being made to set up school cultural clubs.

TRENDS AND PROBLEMS

The main obstacles slowing up the qualitative and quantitative development of academic and technical secondary education are the rather narrow limits of national income, the lack of means of communication, the way the population is scattered, and the shortage of staff.

However, fairly thoroughly revised curricula of a national character are being considered for all secondary institutions. It is intended to apply them, at least in one pilot school, from the beginning of the school year in September 1960. Examinations will also be modified to suit national conditions. Academic secondary education will be organized in three cycles (complementary, middle and higher). The national language will gradually become the medium of instruction at this level. In the technical sections, the number of subjects for specialization will be increased in order that all the country's needs may be met under its plan for economic development; the level of studies will be gradually raised to that of the technical *baccalauréat*. Two new education centres, with technical sections, will shortly be opened at Luang-Prabang and Paksé. Secondary education of the academic, technical and craft types will be progressively extended to all provincial centres. It is also intended to start training—within the country and as rapidly as possible—Laotian teachers for the various sections and subjects.

With their progress year by year, the Medical School, the Centre for Legal, Political and Administrative Studies and the National Education Centre will, as soon as possible, be raised to the level of faculties associated with the Sisavang Vong National University.

[*Text prepared by the Ministry of National Education in December 1959.*]

STATISTICS

Total population: 1,690,000.
Area: 91,429 square miles; 236,800 square kilometres.
Population density: 18 per square mile; 7 per square kilometre.

Summary of school statistics, 1953–56. Enrolment in all public educational institutions at primary and secondary levels totalled about 77,000 in 1956/57, representing 5 per cent of the estimated population. Of the total enrolment, nearly 98 per cent was in primary schools and just over 2 per cent in general and technical secondary schools. There were in addition 51 students in the teacher training school. Girls made up 26 per cent of enrolment in public primary schools in 1956/57 against 24 per cent in 1953/54.

Data on enrolment of girls in secondary schools are not available. The teaching staff numbered 2,060 in all public schools in 1956/57, of whom 1,957 were in primary schools. The proportion of women teachers in general secondary schools was 39 per cent; figures for primary schools are not known. The average pupil-teacher ratio in public primary schools was 38 in 1956/57 compared with only 20 in 1953/54; over the same period primary school enrolment had increased by 125 per cent. In general secondary schools, the pupil-teacher ratio stood at about 20 in 1956/57 and enrolment had increased by 41 per cent over 1953/54. The number of students training to be teachers doubled between 1953/54 and 1956/57. (See Table 2.)

Examination results in secondary education, 1953–57. From the incomplete data available it appears that 20 candidates passed the *baccalauréat* in 1956/57, compared with 5 in 1953/54. In the same year 25 students were awarded a teaching diploma, against 14 in 1953/54. The proportion of successful women candidates for these examinations is unknown.

Educational finance, 1957. Total expenditure on education in the financial year 1957 was 144,840,910 kips representing about 88 kips per inhabitant. 24 per cent of this sum was for capital expenditure; the distribution of recurrent expenditure is given in Table 1B.

THE EDUCATIONAL SYSTEM

The educational system of Lebanon has grown in a most complex manner. Owing to the geographical situation of their small country, and the succession of foreign powers which have governed it through the centuries, the people of Lebanon have come under the influence of widely differing civilizations without, however, losing their individual character. With the increasing number of intellectual currents, the opposition of social and economic pressures has increased, and a distinctively Lebanese context has developed.

Consequently, it is no easy task to characterize Lebanese education, the most striking feature of which is the coexistence of three separate systems, reflecting the different influences mentioned above. These are: (a) the Latin system, as followed by the Catholic University of Saint Joseph, which is a French institution, and a number of associated colleges; (b) the Anglo-Saxon system, that of the American University of Beirut and a group of Protestant colleges founded by English and American missions; (c) the national system of Lebanon, created in 1924, which runs parallel to the other two and is developing rapidly. One should not, however, think that a gulf separates these different systems, or exaggerate the danger to Lebanese pupils from their exposure to divergent educational practices; this very diversity is rather a source of intellectual enrichment. Moreover, the educational institutions themselves have taken action to avert the danger of disunity. The American University of Beirut, for example, has a *Section Secondaire* which applies the French programme but teaches the English language. English is taught in most schools which follow the Franco-Latin system. French and English are equally acceptable as subjects in public schools, alongside Arabic, which is compulsory for examinations.

The second important aspect of Lebanese education—and of secondary education in particular—is that responsibility for its provision is shared between the Lebanese Government and private institutions, both national and foreign. This dualism is approved in the Constitution itself, which states in Article 10: 'Education is free in so far as it is not contrary to public order and good morals and does not affect the dignity of the several faiths. There shall be no violation of the right of the communities to have their schools, subject to the general prescriptions concerning public instruction which are decreed by the State'.

Within the general framework of this law, various factors favour the more or less individual development of schools.

More than a dozen different faiths are represented in Lebanon, each of which wants its own schools, where the appropriate religious instruction can take its place beside the officially established curriculum. In this way, Maronite, Sunnite, Greek Uniate, Greek Orthodox, Shiite, Protestant, Druse and other schools have been established.

Linguistic factors also come into play: some schools insist on the importance of the Arabic language and wage a struggle for its exclusive use in education; others consider that Arabic is not a suitable vehicle for advanced technical training. Again, schools using Armenian as the language of instruction have been opened for the several thousand Armenians who now hold Lebanese nationality.

Finally, there should be some mention of the great efforts made by different countries in the field of education and culture. France subsidizes certain schools, lends teachers to others, and runs study centres; the United Kingdom and the United States of America have their agencies, the Federal Republic of Germany has recently founded a German school in Beirut, in addition to the Goethe Institute which holds German courses for adults. There is also an Italian school and the Dante Alighieri Institute, where Italian is taught.

Although the Constitution provides for freedom of private education, all decisions concerning curricula are the responsibility of the Ministry of National Education and Fine Arts, which supervises their implementation, approves textbooks for use in public and private schools, organizes official examinations at the different levels, and confers the primary certificate (*certificat d'études primaires*), the complementary or lower general secondary certificate (*brevet*), and the baccalaureate (parts 1 and 2). The Ministry authorizes the opening of new schools throughout Lebanon, and may also withdraw its authorization if Lebanese educational law is not respected.

The role of private bodies in regard to the schools they operate is a purely administrative one. They adapt the official curricula to their needs, and may add weekly hours for the teaching of chosen subjects, but not at the expense of the stipulated time-table for other subjects. They are responsible for the selection of teachers, the collection of fees and the organization of entrance and final examinations.

The diagram on page 785 shows the structure of the Lebanese school system.

THE DEVELOPMENT OF SECONDARY EDUCATION

The beginning of the twentieth century saw a complete reform of the educational system of Lebanon, and the introduction of graded schools, where the pupil's age and level of education were taken into account. At this period Western influence was already strong in Lebanon, although the country still belonged to the Ottoman Empire. Impetus was given to this movement for reform and modernization by the University of St. Joseph and the American University in Beirut, which based their higher education on modern scientific methods. Centres of intense cultural activity were to be found in Mount Lebanon—in the district of Kesrawan in particular. The Lazarite mission college of Antoura, the Maronite seminary of Ain-Waraka, the monastery of Mar

Hanna (where Volney spent several months) and the school of Ghazir, to name only the most important establishments of the period, all came under strong Western influences.

The Ottoman authorities could only fall into step with this progressive evolution; unfortunately, the events of 1914 prevented the fruition of reforms introduced by the Turkish Government.

During the French mandate (1919–44) educational organization and curricula were based on French models. Arabic, though recognized as the national language, played only a limited role in education. From 1929, however, Lebanese certificates were conferred, their equivalence with French certificates soon being established.

Following the declaration of independence in 1944, Arabic replaced French as the medium of instruction and became the only compulsory language for official examinations.

Within the framework of this general evolution, secondary education has for the most part retained its autonomy, or has at least been kept apart from primary education.

Legal basis

Laws at present governing complementary (lower secondary) and secondary education are the following: Presidential Decrees Nos. 6999 and 7003 of 1 October 1946, dealing respectively with the programme for *cours complémentaires* ('complementary' i.e. primary continuation classes, at lower secondary level), and with examinations for the certificate (*brevet*); Presidential Decrees Nos. 7001 and 7004 of the same date, dealing with the secondary programme and examinations for the *baccalauréat;* Ministerial Decree No. 3389 of 14 September 1953 on the internal organization of public primary and continuation schools; Legislative Decree No. 26 of 28 January 1955 on the reorganization of the Ministry of Education and Fine Arts; Ministerial Decree No. 592 of 12 October 1955 on the internal organization of public secondary schools.

Administration

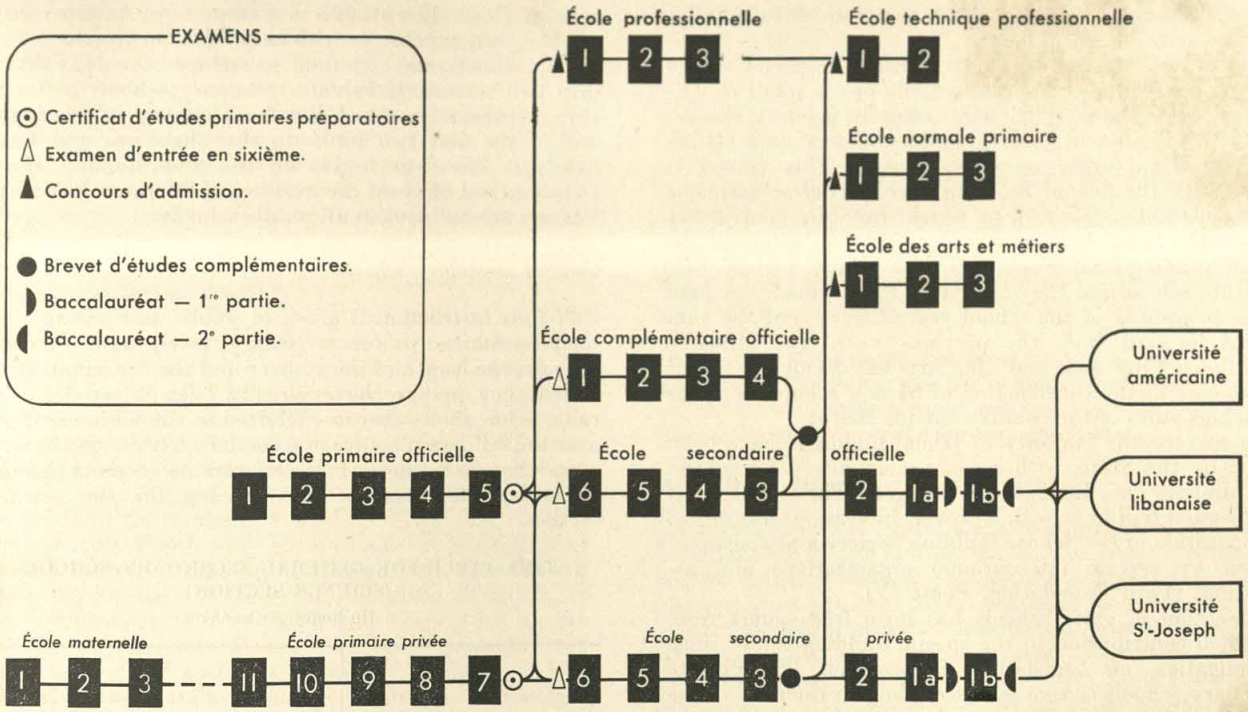
Legislative Decree No. 26 established within the Ministry of National Education nine independent services supervised by the Director-General of Education and ultimately by the Minister. Three of these services are of particular interest here: the Secondary Education Service, the Directorate of Vocational Training and the Teacher Training Service. The Secondary Education Service controls the nine public secondary schools existing at present in Lebanon. Primary schools with *cours complémentaires* come under the Directorate of Primary and Complementary Education, and vocational and technical schools—including those at the secondary level—under the Directorate of Vocational Training.

The chief of the Secondary Education Service, assisted by the inspectors of secondary education, is responsible to the Minister of Education for all matters concerning the appointment and transfer of secondary school teachers. He has to ensure the satisfactory operation of the schools and to watch over the quality and tone of their teaching. His control over private secondary schools and their staff is more or less nominal.

Ministerial Decree No. 592 of 12 October 1955 laid down detailed directives for the operation of public secondary schools: the recruiting and admission of pupils, their distribution by class, questions of curriculum, committees of teachers for each subject, discipline and supervision, fees, duties and privileges of school principals and teaching personnel, examinations, holidays, etc.

The Directorate of Vocational Training is responsible for all public technical schools, both primary and secondary. Article 29 of Legislative Decree No. 26 stipulates that the Directorate shall 'assist private institutions in the formation of vocational schools and seek to co-ordinate the efforts of these institutions'.

The Teacher Training Service was also established by the same decree. The Primary Teacher Training School—the only teacher training establishment which exists at present in Lebanon—functions as a secondary institution, but with a special curriculum. Legislative Decree No. 26 also instituted rural teacher training schools, but these are still at the planning stage.



In addition to these three services, and working in close collaboration with them and with the Centre for Pedagogical Research, there is the Curriculum and Textbook Service. It is responsible for the preparation, implementation and revision of school curricula. This service also controls textbooks, authorizing or prohibiting their use, whether they are of Lebanese or foreign origin; its judgement in this matter is strictly objective, and is based solely on their educative and moral value. An authorized work need not, however, be adopted by the Secondary Education Service; and the Textbook Service, far from insisting on the use of certain books, leaves their choice to the principals of the various establishments.

Supervision and inspection. All school inspectors are civil servants, appointed on the results of a competitive examination organized by the Ministry in conformity with existing laws.

The qualifications of candidates are laid down in Legislative Decree No. 26. Inspectors of primary and complementary education must have: (a) a teaching certificate (*licence d'enseignement*), or its equivalent, and at least 3 years' teaching experience; or (b) the diploma of the complementary teacher training school (*brevet d'instituteur*) —or its equivalent—and at least 5 years' teaching experience; or (c) the diploma of the primary teacher training school (*certificat d'instituteur*) and at least 10 years' teaching experience.

Inspection of technical education is ensured by 'shop foremen' (*techniciens chefs d'atelier*) who are recruited by competitive examination; candidates for these posts should be either technical instructors (*moniteurs techniques*) with at least 10 years' service; or hold the assistant-engineer's diploma of the National School of Arts and Crafts.

Inspectors of secondary education are recruited in the same way by public examination, the qualifications for candidature being the teaching certificate (*licence d'enseignement*), plus one of the following: at least 5 years' teaching experience at the upper secondary level; 5 years' service as inspector of primary and complementary education; 3 years' service as principal of a secondary school.

GLOSSARY

école complémentaire officielle (public complementary, i.e. primary continuation school): lower general secondary school.
École des arts et métiers (National School of Arts and Crafts): vocational training school comprising a higher technical school and a school for training hotel and restaurant personnel.
école maternelle: pre-primary school.
école normale primaire: teacher training school.
école primaire: primary school, either public (*officielle*) or private (*privée*).
école secondaire: general secondary school, either public (*officielle*) or private (*privée*).
école technique professionnelle: vocational school of technical training.

HIGHER EDUCATION

Université américaine: American University of Beirut.
Université libanaise: Lebanese University.
Université St. Joseph: St. Joseph's University.

EXAMINATIONS

Baccalauréat: baccalaureate (university entrance) examination taken in two parts, *1re partie* and *2e partie*.
Brevet d'études complémentaires: complementary school (lower secondary) certificate.
Certificat d'études primaires préparatoires: preparatory primary studies certificate.
Concours d'admission: competitive entrance examination.
Examen d'entrée en sixième: secondary school entrance examination.

The jurisdiction of state-appointed inspectors extends, in principle, to all schools in Lebanon, but, as the number of schools is large, and the inspectorate a small one, their activity is for the moment confined to public schools. Inspection of private schools is carried out in different ways: the French Embassy in Beirut sends inspectors from the French Cultural Mission to inspect French schools or those subsidized by the French Government; the Protestant missions, or the heads of the other religious communities, appoint inspectors to supervise application of the curricula and the quality of the teaching given in their respective schools.

Inspectors of education have to ensure the satisfactory progress of studies in establishments within their jurisdiction. They may call meetings of teachers in a given school in order to concert with them about the best methods of teaching different subjects, or to settle a given teacher's difficulties. They may send letters of encouragement, congratulation or censure. They suggest the fines to be imposed by the Education Service or by the appropriate director on slack or repeatedly offending teachers.

Finance. The necessary funds for public schools and teachers' salaries are charged to the budget of the Ministry of National Education and Fine Arts, which is voted in the normal way by Parliament. Details of the 1959 budget are given in Table 1 on page 788.

Private schools are financed by pupils' fees, subventions

from the Lebanese or other governments or by funds allocated by certain associations.

Legislative Decree No. 26 established a special school building fund. Pupils in state schools pay a small contribution to this fund: £(L)3 per annum in primary classes, £(L)15 per annum in lower secondary classes, and £(L)25 per annum in upper secondary classes. This money is lodged with the School Building Society (*Caisse autonome des constructions scolaires*), to which the State contributes an annual sum of £(L)558,000. In 1959 the budget of the special building fund reached £(L)2.4 million, representing the state allocation, the total yield from school fees paid at the beginning of the school year 1958/59 and the sum carried forward from the previous year. The Ministry of National Education and Fine Arts has decided to invest this money in the construction of 64 new school buildings in various parts of the country outside Beirut.

Up to now the majority of school buildings have been rented by the State, with a consequent heavy burden on the Ministry of Education's budget. The number of state-owned buildings will, however, increase as a result of the operation of the School Building Society and assistance offered by certain international organizations and associations (Ford Foundation, Point IV).

Education in state schools has been free—apart from the small contribution to the special building fund—since promulgation of Legislative Decree No. 26. Private secondary schools charge fees according to their size. Fees in the terminal class, for example, vary from £(L)450 to £(L)1,500 per annum. A large part of the annual budget of the Ministry of Education and Fine Arts is reserved for assistance to industrious pupils in all Lebanese schools to schools offering free education, and to Lebanese students receiving specialized education in other countries; each year about fifty scholarships are available for study abroad.

TYPES OF SECONDARY EDUCATION

After completing primary school and receiving the primary certificate, the pupil may choose one of several courses. He may enter a vocational school, where general studies at the lower secondary level will be accompanied by 3 years of preliminary training for the occupation best suited to his capabilities; the pupil leaves this school with the title of skilled worker (*ouvrier qualifié*). He may, however, enter an *école complémentaire*, continue his studies up to the lower secondary certificate (*brevet*), and then apply for admission to the primary teacher training school, to the rural teacher training school, to the National School of Arts and Crafts, to certain vocational schools of technical or commercial training (upper secondary level) or to the Agricultural School of Beirut. A third alternative open to the primary school leaver is to enter the secondary stream proper which, after 7 years and the two-part *baccalauréat* examination, qualifies him for admission to university. All the above-mentioned establishments give classes during the day and have a weekly time-table of 30 hours.

Post-secondary education takes many forms: Beirut alone has three universities, and Lebanese students who wish to specialize in branches of learning not taught in Lebanon may continue their studies in Europe or in America, either at their own expense or with help from the State.

The school year in public secondary schools is divided into two semesters. Private secondary schools prefer the three-term system, which has the advantage of relating the end of the first two terms to the Christmas and Easter holidays. The year begins on the first Monday after 5 October, and ends on the evening of 30 June. Friday and Sunday are holidays in all public schools.

General secondary schools

Full-time instruction is given in public and private *écoles complémentaires* (lower secondary level) and secondary schools; the length of the courses and the examinations for which they prepare have already been referred to. The table below shows the time allotted to the various subjects over the full 7-year course in secondary schools; in the upper stage there is a choice between various sections (literary, scientific), the example given being for the scientific section.

TIME-TABLE FOR GENERAL SECONDARY SCHOOLS
(SCIENCE SECTION)
(in hours per week)

Subject	Year						
	1	2	3	4	5	6	7
Arabic	6	6	7	7	5	5	–
French or English	6	6	6	6	5	5	–
Arab philosophy	–	–	–	–	–	–	3
General philosophy	–	–	–	–	–	–	3
History and geography	2½	2½	3	3	3	3	3
Moral and civic instruction	1½	1½	2	2	–	–	–
Moral and religious instruction	1	1	1	1	2	2	2
Mathematics	4	4	3	3	5	5	8
Physics, chemistry and natural sciences	4	4	3	3	6	6	9
Physical education	2	2	2	2	2	2	2
Music and singing	1	1	1	1	1	1	–
Arts and crafts	2	2	2	2	1	1	–
Total	30	30	30	30	30	30	30

In addition to these full-time schools, there are a large number of secondary education establishments for workers and adults. These give evening classes up to the level of the *baccalauréat* examination for candidates who are unable to attend school during the day or who have passed the age limit for enrolment in secondary schools. Their programmes are condensed; in place of the 30-hour weekly time-table of the ordinary day schools, they have one of 18 hours—3 hours each evening (6 p.m. to 9 p.m.), 6 days a week.

The time-table is divided as follows: 5 hours of Arabic, 4 hours of French or English, 4 hours of mathematics and 3 hours of science, 1 hour of history and 1 hour of geography.

The main aim of these evening schools is to assist people in employment who wish to continue their studies up to the baccalaureate in order to qualify for promotion or for an increase of salary.

In these schools recruitment of pupils is left to the

discretion of the principals, and further selection is made automatically at the end of each year, at the time of the examinations for the *brevet* and the *baccalauréat*. The standard of evening schools is definitely below that of full-time schools, as is indicated by examination results: whilst the percentage of successes for full-time schools is between 55 per cent and 65 per cent, that for the evening schools varies between 5 per cent and 10 per cent—although in the great majority of cases the teaching staff is the same.

Vocational and technical schools

Technical education has only two levels: lower—for vocational schools rather than technical—and secondary. Only those pupils who have obtained the lower general secondary certificate (*brevet*) are admitted to technical secondary schools. The School of Arts and Crafts in Beirut, which is the model for such schools, comprises two distinct branches: the Higher Technical School for Assistant Engineers and the Training School for Hotel and Restaurant Personnel. Pupils may enrol in one of the following sections: building and civil engineering, mechanical engineering, electrical engineering, industrial chemistry or hotel management. The course lasts 3 years, with an examination at the end of each year, and graduates are awarded either an 'assistant engineer' certificate or the certificate of the Training School for Hotel and Restaurant Personnel. The Agricultural School of Beirut is also a secondary establishment.

There are other public vocational secondary schools (full-time instruction) at Tripoli and Zahlé, and there are evening schools concerned primarily with business, bookkeeping, radio and electrical engineering.

Teacher training schools

The primary teacher training school at Bir Hassan, near Beirut, prepares public primary and lower secondary school teachers. Candidates for admission must hold the lower secondary certificate (*brevet*) and pass an entrance examination. The course lasts 3 years. The first year is devoted to general cultural improvement and Arabic and French—the two languages of school instruction. In the second year the general cultural programme is continued, with the addition of child psychology and educational theory. The final year stresses applied pedagogics and teaching practice supervised by the training school staff.

The school has separate sections for men and women. Of the 360 pupil teachers enrolled in 1959, 162 were female.

Increasing importance is being given at the school to handicrafts, gymnastics, music, and to dressmaking and domestic science (for girls). Excellently equipped laboratories for physics, chemistry and natural sciences were opened in 1959. There is a well-stocked library where pupils may find and take out on loan all the books necessary for their studies. Visual aids are also at the pupils' disposal. The various embassies and cultural missions at Beirut lend educational films to be shown in the school cinema, and a film library is being formed.

Plans have been made for the construction of three new primary teacher training schools, including a rural training school, and of a complementary (lower secondary) teacher training school, as soon as funds allow.

The Catholic Episcopate of Lebanon is building a free teacher training school in Beirut.

Article 51 of Decree No. 26 determines the status of the staff of the teacher training school. Some members are employed on a permanent basis, others are recruited according to the needs of the school, and receive individual contracts. All teachers must hold a teaching certificate or its equivalent. Foreign teachers are sometimes employed under contract.

Other specialized schools

Several schools of music and art exist in Lebanon; they are, however, difficult to classify among secondary schools, although the qualifications required for admission are inferior to those required by the universities.

Out-of-class activities

The participation of pupils in school government and social life is greater in private schools than in those maintained by the State. Principals of private schools have more freedom of action than their colleagues in public schools, who are obliged to consult the Ministry of Education through the intermediary of the Secondary Education Service. Nevertheless, Article 61 of Ministerial Decree No. 592 (12 October 1955) authorizes the organization of literary clubs in secondary schools, where pupils find scope for their literary gifts, and where friendly rivalry is encouraged between pupils belonging to the same class.

Sports and games are more widely practised in private than in public schools. In the latter, the sports instructors are too busy with physical education classes to leave them much time for out-of-class activities.

TRENDS AND PROBLEMS

The most important current problem concerns the remoulding of the secondary curricula. The present curricula were drawn up hastily after the declaration of independence in 1944, when it was essential to create a wholly Lebanese programme leading to the award of Lebanese certificates. The matter is at present being examined by the Curriculum and Textbooks Service in collaboration with committees of specialists and education experts and the Centre for Pedagogical Research.

One trend which may have grave consequences for the future of Lebanon is becoming more and more noticeable: the proportion of secondary school leavers enrolling at the universities is becoming so large that in the not too distant future there will be overcrowding in the liberal professions, and a consequent crisis in the labour market. Hence the importance of guidance at the primary school level, whereby young people will be directed towards the manual professions, industry or agriculture. The development of guidance services is one of the functions of the Centre for Pedagogical Research.

STATISTICS

Population (mid-year 1957 estimate): 1,525,000.
Area: 4,015 square miles; 10,400 square kilometres.
Population density: 380 per square mile; 147 per square kilometre.

Summary of school statistics, 1954–57. The only data available from the Ministry of Education, for the school years 1954/55 to 1957/58, refer to public and private primary, complementary and secondary schools. (See Table 2.) Some data for 1954/55 relating to other levels and types of education may be found in *World Survey of Education: II—Primary Education.*

Educational finance, 1959. For the year 1959, the budget of the Ministry of Education and Fine Arts amounted to about 31 million Lebanese pounds, representing 15 per cent of the national budget and averaging nearly £ (L) 20 per inhabitant. This amount includes expenditure for the National Library and the Department of Antiquities (4.5 per cent of the total). Central administrative costs amounted to 8.8 per cent of the total budget of the Ministry. (See Table 1.)

LIBERIA

Liberia was originally founded as a place of asylum for people of colour by the American Colonization Society, a philanthropic organization. The first colonists landed at Cape Mesurado in 1821, and the Republic became an independent State on 26 July 1847.

Liberia lies on the West African Coast, 10 degrees north of the equator, and has as its neighbours Sierra Leone, Guinea and the Ivory Coast. Administratively it is divided into five counties (Sinoe, Grand Bassa, Grand Cape Mount, Montserrado and Maryland), three provinces (Eastern, Central and Western), and four territories (River Cess, Marshall, Sasstown and Kru Coast).

The Government of Liberia is divided into three branches, each responsible to the other. These are the Executive, composed of the President, County Executives and Cabinet; the Legislative, which comprises the House of Representatives and the Senate; and the Judiciary, which is composed of the Supreme Court and the lower courts.

THE EDUCATIONAL SYSTEM

The Constitution places responsibility for the conduct of education on the President of Liberia, and names as his principal adviser on education the Secretary of Public Instruction. This has produced a centralized educational system, the Department of Public Instruction being the only agency of government which formulates laws and regulations regarding education and the conduct of education. The Constitution provides that Church and State shall be separate, and that education shall be the responsibility of the State.

Private agencies such as religious denominations and philanthropic organizations play an important part in the field of education in Liberia, but do not share in the formulation of educational policies or educational rules and regulations and are obliged to conform to those laid down by the Department of Public Instruction.

The structure of the school system is as follows: 3 years of pre-primary school, 6 years of primary school (grades 1 to 6), 3 years of junior high school (grades 7 to 9), 3 years of senior high school (grades 10 to 12) and 4 years of college. There is also a 4-year vocational secondary course (grades 9 to 12) based on 8 years of general schooling. The University of Liberia has faculties in Liberal Arts and Sciences, Teacher Training, and Law.

THE DEVELOPMENT OF SECONDARY EDUCATION

The Education Act of 1900, amended in 1912, 1937 and in 1943, provides the legal basis for education in Liberia. Under the Act the national government is responsible for the operation of the public educational system, and all forms of education—public or private—come under the control and supervision of the Secretary of Public Instruction.

The planning and direction of educational programmes is carried out by the Secretary of Public Instruction (Minister of Education) assisted by two under-secretaries, one assistant secretary and other personnel, including a director of secondary education and a supervisor of schools in each of the political divisions of the country. The task of these last officials is to transmit departmental instructions to heads of schools and to ensure that the educational standards set by the department are maintained.

No department of government other than the Department of Public Instruction administers secondary schools.

Supervision and inspection are normally conducted by the supervisors of schools but other officials of the department may also carry out inspections when necessary. Supervisors are recruited from the teaching profession in the area concerned; usually from among school principals having a university degree.

All public education in Liberia is financed by the Central Government with funds from the general revenue appropriated annually by the legislature in accordance with estimates submitted by the department. The Government also subsidizes annually the various parochial and philanthropic schools in the country.

In the public education system, funds for buildings, equipment, supplies and salaries are administered by the Department of Public Instruction; no money is sent to schools.

No fees are charged in public schools for pre-primary and primary education, but a small fee is charged for secondary education, ranging from 15 dollars annually in public schools to about 50 dollars in private schools. There is a scholarship programme whereby any student who can pass the department's qualifying examination may receive a local scholarship for study in a public secondary school.

TYPES OF SECONDARY EDUCATION

There are at present two main types of secondary education in Liberia: general, which prepares for higher education; and vocational, which gives instruction in a trade for a period of 4 years. There is also a system of adult education offering a 4-year course for those who were not able to complete secondary education earlier; this is provided at such institutions as the People's College of the University of Liberia, the Martha Tubman Academy and the Zion Academy. Other types of education open to pupils leaving elementary schools include specialized vocational training courses—secretarial studies, dressmaking, etc.

The secondary school year begins on 15 February and ends on 30 November. The first semester ends in June and the second semester starts in July. The school week is from Monday to Friday, and the school day is from 7.30 a.m.

to 1 p.m. There are about 4 days' holiday for Easter and about the same between the semesters, about 12 national holidays, with an additional day whenever an African State becomes independent.

The only vocational secondary school in the country is the Booker Washington Institute, at Kakata. It is a secondary school with 4-year courses in agriculture, domestic and commercial science for girls, building trades, textiles, electrical and mechanical trades, plumbing and machine shop.

At present there are two types of training centres for teachers for the elementary schools: these are the Klay Fundamental Education Center, and the Projected ZorZor Teacher Training Institute. For the Klay Center, students are selected from the various administrative divisions of the country after completing the eighth grade. They are then required to pass a placement test as a qualification for entering the course. The curriculum includes 1 year of teacher training and 1 year of fundamental education. The teaching staff is composed of persons who have taken training on Unesco fellowships at other centres of fundamental education. Examinations are held every 6 weeks and at the end of each semester.

TRENDS AND PROBLEMS

Education in Liberia today is designed to provide the trained men and women needed to carry out the country's development programme.

The principal problem of secondary education is the lack of students qualified to enter the available secondary schools. Since the only solution is to expand primary education, the Department of Public Instruction has decided to build 100 school buildings for primary schools throughout the country during the next 4 years. To provide the teachers to man these schools, the department will open 5 new junior colleges offering a course of only 2 years of instruction beyond the secondary school.

The Government also hopes that the recent reorganization of secondary education into senior and junior high schools and the staffing of these schools with qualified instructors in languages, science, mathematics and social sciences will raise the standard of instruction. The problem is, in fact, one of expanding and improving education at the same time.

With regard to vocational education, a school is needed at Monrovia where skilled and semi-skilled workers can attend courses after working hours, and more vocational secondary schools are required to train technicians.

NATIONAL TEACHERS ASSOCIATION. *Education in Liberia.* Monrovia 1954. 152 p.

STATISTICS

Population (mid-year 1958 estimate): 1,250,000.
Area: 43,000 square miles; 111,370 square kilometres.
Population density: 29 per square mile; 11 per square kilometre.

Summary of school statistics, 1953–56. In 1956/57, total enrolment (not including adult education) was 54,000, or about 4 per cent of the total population. Of these pupils, 5 per cent were in kindergartens, 86 per cent in primary schools, 8 per cent in secondary schools, less than 1 per cent in institutions of higher education. The proportion of girls was 26 per cent in primary schools, where there was an average of 31 pupils per teacher. Between 1953 and 1956, primary school enrolment increased by 15 per cent. (See Table 2.)

Educational finance, 1957/58. For the fiscal year beginning in September 1956, total expenditure on education amounted to 1.7 million dollars, averaging about $1.40 per inhabitant. Recurring expenditure represented 87 per cent of the total expenditure. (See Table 1.)

LIBYA

THE EDUCATIONAL SYSTEM

Articles 28, 29 and 30 of the Constitution of the United Kingdom of Libya affirm the right of all Libyans to education and state that schooling shall be compulsory for boys and girls.

The Educational Act of 1952 provided that each of the three provinces in the Kingdom should, within a reasonable period of time, establish the primary, secondary and technical schools required to meet the educational needs of the citizens; and that the provinces should maintain these schools out of their own budgets, and establish boarding sections.

The Minister of Education in the Government of the United Kingdom of Libya is assisted by an advisory body, the Higher Council of Education, which consists of the Minister as chairman, the Director-General of the Ministry of Education as deputy chairman, the Commissioners of Education in the three provinces, and six citizens, two from each province, who are appointed by the Minister of Education upon the recommendations of the Commissioners of Education.

The Ministry of Education is responsible for laying down the broad lines of educational policy, and for providing guidance and direction. It supervises the system of education and makes regulations concerning methods, textbooks, examinations, the granting of degrees, and the qualifications of teachers and inspectors. It also supplies provincial education authorities with information on recent ideas and trends in education. The Ministry does not itself establish schools and educational institutions, nor does it appoint teachers, pay their salaries, or recommend their promotion; all these and other matters are left to the provinces.

Each province has its own educational administration headed by the Commissioner (*Nazir*) of Education, who is a member of the Executive Council of the province and is responsible to the Legislative Council. Under each Commissioner of Education there is a provincial Department of Education, headed by a director. The provincial education authorities are responsible for establishing schools and educational and training institutions up to university level.

The role of local bodies in the Libyan educational system is practically confined to organizing literacy courses, adult education, and night schools. The Education Departments allow these bodies to use school buildings and facilities in the evenings, and supply them with whatever books and school materials they can make available.

The Free Education Act makes education free at all stages. Laws have been passed organizing primary, secondary, technical, and teacher education.

The structure of the Libyan school system is shown in the diagram on page 795.

THE DEVELOPMENT OF SECONDARY EDUCATION

Before achieving independence, Libya had only a few primary schools and secondary education was rarely available to the indigenous population. There were some specialized institutes for training teachers but these followed the pattern of the Italian schools and accepted only a very limited number of Libyan students.

Secondary education in the full sense did not begin until the year 1947. In the academic year 1947/48 there were 4 secondary schools with 234 students and 18 teachers. By 1956/57 the figures had risen to 9 schools, 4,650 students and 304 teachers. Before 1957 public education in Libya consisted of two levels, primary and secondary, but in 1958 it was decided to divide secondary education into lower and upper stages, known as preparatory and secondary.

Legal basis

In accordance with the Education Act of 1952, the Minister of Education, with the agreement of the Higher Council of Education, promulgated the Secondary Education Law, dated 5 December 1956. In 1957 regulations were issued covering technical schools and public and private teacher training colleges for men and women, and also the examinations held in these colleges. The Technical Education Law organizing and standardizing technical education throughout the country was passed in the same year.

Administration

Decisions with regard to the policy and planning of secondary education are communicated by the Ministry to the three provinces, with instructions and recommendations for their implementation.

The provincial departments usually have a special section for secondary education headed by a General Supervisor of Secondary Education.

Some technical institutes which can be considered to be at the level of secondary education have been established by the Ministry of Health. Among these are the Institute for Health Officers and Inspectors, the centres for the care of mothers and children, and the nurses' schools which are entirely administered and run by the Ministry.

Inspection. In appointing inspectors, the Departments of Education insist on high academic and teaching qualifications and also on experience. In addition Libyan inspectors are sent on study missions to countries with well developed educational systems, and special courses in education and psychology are organized for candidates for inspectors' posts.

Finance. All educational expenditure by the provincial Department of Education is provided for in the general

budget of the government of the province. This chapter of the budget, which is prepared by technical experts in the Department of Education, is referred to the Executive Council for ratification and then sent to the Legislative Council for discussion and adoption.

The Ministry of Education assists the Commissioners of Education to obtain special funds for school building programmes from the technical assistance agencies.

Some secondary schools, particularly those in the cities, have formed parents' associations to improve relationships between school and society and to help solve material and other problems.

Teachers are provincial public servants and their salaries are in accordance with civil service scales in the province.

Education is free, and the Government also makes every effort to provide further help for poor students to encourage them to continue their studies.

School buildings. School architects take into consideration the most modern educational and health requirements. The schools are well equipped and have large playing areas, land for agricultural experiments, and school gardens.

School welfare services. The provincial governments, and the educational authorities in particular, offer students various kinds of social and health services. School meals are provided for all the students in day schools. This programme is financed through customs duties, assistance from the international agency, Unicef, and from the American aid organization CARE.

TYPES OF SECONDARY EDUCATION

By the time a student has completed primary education, the school will have an idea of his interests and aptitudes and will advise him and his parent or guardian on the choice of the kind of further education for which he is fitted. Thus he is either enrolled in a preparatory (i.e., lower general secondary) school or enters an intermediate vocational school, such as a public teachers' institute, an agricultural, commercial, or industrial school, etc. At the end of the preparatory stage, he may either continue his general secondary education or enter one of the technical and vocational high schools, which include, in addition to the above-mentioned schools, the institutes of health officers and inspectors and applied engineering. Every student who concludes his secondary studies successfully has a chance to carry on his higher education: he may either be sent abroad on a scholarship, or enrolled in one of the colleges in the Libyan University, or may enter the Military College in Benghazi. Students who are unable because of personal circumstances to complete their secondary education, may enrol in evening schools in the larger towns or attend the special or technical courses which are organized whenever the number of students is sufficient.

The school year of 219 school days begins on 12 September and ends on 25 June, with a break from the 14th to the end of February. Schools are open every day of the week except Friday. A school day comprises 5 hours 20 minutes and is divided into periods of 45 minutes.

General secondary schools

Public secondary education in Libya is divided into two stages—preparatory and secondary proper.

The purpose of secondary education is to prepare good and useful citizens who will be able to contribute to the development of their community. The secondary school is intended to be a place in which the student may acquire self-knowledge and gain worth-while experience, and not a place in which his head is filled with information and rules that do not touch on the essential problems of living.

The preparatory (lower secondary) stage. To be admitted, a student must have a certificate proving that he has finished his primary studies, or that he has reached an equivalent level. During the 3-year course in preparatory schools the following subjects are taught: the Koran and religion, Arabic, a foreign language, history, civics, geography, mathematics, general science, hygiene, drawing, practical work (including handicrafts and horticulture for boys, and needlework and domestic economy for girls), songs, music, physical education and games. In addition, pupils take part in various free school activities adapted to the environment which give them an opportunity to follow their interests and reveal their talents.

Promotion examinations are held at the end of the first and second years. In the aggregate for each subject, marks earned throughout the year account for 25 per cent of the total, and the written examination at the end of the year for 75 per cent. The provincial education departments hold a general examination, in two stages, at the end of the final year of the preparatory stage; students who pass are awarded the Certificate of Preparatory Study.

The upper secondary stage. This is the second and final stage in public secondary education. Here again the course lasts 3 years. To be admitted a student is required to have the Certificate of Preparatory Study or equivalent qualifications. In the first year all students take the same subjects; in the second and third years studies are divided into two sections: arts and sciences. The time-table is shown on the following page.

Promotion examinations at the end of the first and second years of the upper secondary stage are organized by special committees appointed by the principal of the school; the committees set the papers, correct them, and announce the results. The final examination at the end of the third year, however, is organized by the Ministry of Education, with the assistance of professors from the Libyan University. Successful students are awarded the Certificate of Public Secondary Study. No student is considered to have passed the examination unless he obtains the prescribed minimum mark in each subject (e.g., 20 out of 40 for Arabic, 16 out of 40 for first foreign language, 12 out of 30 for second foreign language) and 50 per cent of the total marks obtainable in all subjects.

Teachers. As the number of Libyan teachers is not at present sufficient for the needs of the secondary schools, the provincial authorities employ competent teachers from abroad.

TIME-TABLE OF UPPER SECONDARY STAGE
(in periods per week)

Subject	Common studies 1st year	Arts sections 2nd and 3rd years	Science section 2nd and 3rd years

1. Including mechanics.
2. Arabic, English, history, or geography.
3. Mathematics, physics, chemistry, or biology.

Religious institutes

These institutes have their own curricula and regulations, which do not differ greatly from those of the government schools except in that they emphasize the study of the Arabic language and Muslim Law. They are divided into the following sections: primary section (4 years); secondary (5 years after the primary section); advanced (4 years after the secondary section); specialization sections (2 years and 5 years after the advanced section).

Vocational and technical schools

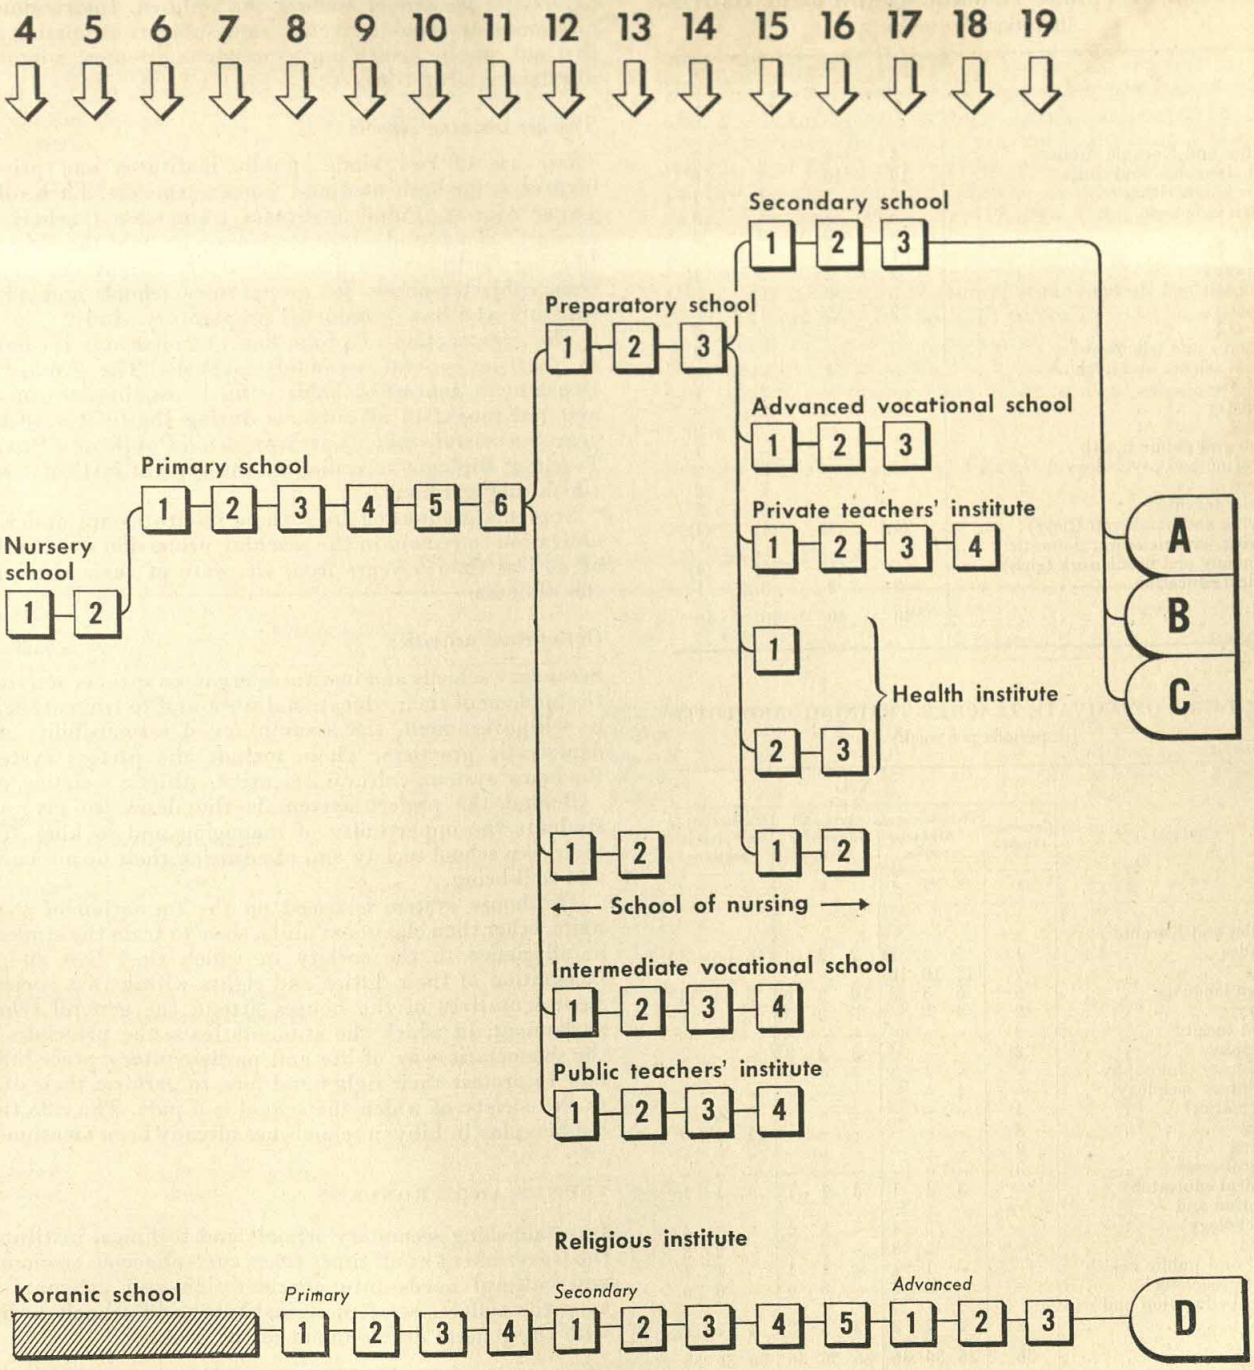
The objectives of technical education are: to prepare young people for living in the modern world, and to train skilled artisans and technicians in the various fields and levels of productive activity, according to the technological needs of the country.

Generally speaking, schools providing technical and vocational education in Libya may be divided into three groups: industrial schools, agricultural schools, and commercial schools.

Technical education is further divided into two levels: (a) intermediate, training artisans and skilled workers; the courses last 4 years and are open to holders of the Primary Certificate; (b) advanced level, training highly skilled artisans and assistant technicians; the courses last 3 years, and are open to holders of the Preparatory (lower secondary) Certificate.

A written examination is held for promotion within the course, and there is also a final written examination. In schools where the course of study includes factory work, no student may sit for a written examination unless he has obtained at least 60 per cent of the total marks for practical training and factory work and the prescribed minimum marks for each branch and subject of the latter. In the proportion of 40 to 60 respectively, marks obtained for work (other than factory work) done during the year are taken into consideration in conjunction with those obtained in the written examination.

Training Centre for Fundamental Education. This centre was established with the aid of Unesco in 1957, and now offers a 3-year course. Students are trained in adult education, in methods of teaching literacy, in health and hygiene, rural occupations, and the teaching of general cultural subjects.



Institute for Health Officers and Inspectors. Established in 1957 by the Ministry of Health jointly with the World Health Organization and Unicef, this institute trains health officials, especially for rural areas. There are two sections. (a) *For health officers:* the aim is to train staff to run health services, including technical services, under the supervision of doctors. The duration of study in this section is 3 years. Entrants are required to have completed their preparatory (lower secondary) education. Subjects taught include elementary science and medicine, public health, health education, elementary surgery and first aid. The students receive practical training in hospitals and clinics and in the field. (b) *For health inspectors:* a 12-month course open to students holding the Preparatory Certificate. Subjects include arithmetic, physics, chemistry, sciences related to public health, statistics, etc. Special emphasis is placed on the study of environmental hygiene, contagious diseases, personal health, and health education.

GLOSSARY

NOTE. Age-scale is based on the official age for entry to primary school, which is 6 years. Average entry ages for most schools, particularly specialized vocational training schools, are higher than shown.

advanced vocational school: upper vocational secondary school (agricultural or industrial or commercial).
health institute: vocational training school for health inspectors (1-year course) and health officers (2 years).
intermediate vocational school: lower vocational secondary school (agricultural or industrial or commercial).
nursery school: pre-primary school.
preparatory school: lower general secondary school.
private teachers' institute: private teacher training school at upper secondary level for preparatory school teachers.
public teachers' institute: public teacher training school at lower secondary level for primary school teachers.
school of nursing: vocational training school with courses at lower and upper secondary levels.
religious institute: school of general education with curriculum emphasizing Arabic language and Muslim law.

A. University of Libya.
B. Military College.
C. Higher education abroad.
D. Specialized courses at religious institute.

1. Including mechanics in the mathematics and science section.
2. Physics, chemistry and biology; is replaced by botany and zoology in the mathematics and science section.
3. Handicrafts and horticulture for boys, needlework and home economics for girls.
4. One day a week and in the final year, a 3-week period in preparatory schools.

Centres for the care of mothers and children. Instruction of an elementary kind is given in such subjects as nursing and first aid, public health and contagious diseases, anatomy, physiology, obstetrics, etc.

Teacher training schools

These are of two kinds: public institutes and private institutes, for both men and women teachers. Each offers 4-year courses. Public institutes train class teachers for primary schools and admit students who hold the Primary Leaving Certificate or its equivalent. Private institutes train subject teachers for preparatory schools and admit students who have completed preparatory study.

The organization of promotion examinations is similar to that in general secondary schools. The Education Department concerned holds a final examination on the material taught in all subjects during the final academic year. Successful students are awarded a Public or a Private Teaching Diploma according to the type of institute from which they graduate.

Students graduating from these institutes are under an obligation to remain in the teaching profession for a period of no less than 6 years from the date of their obtaining the diploma.

Out-of-class activities

Secondary schools and institutes organize various activities to supplement their educational work and to train students in self-government, the assumption of responsibility and democratic practices. These include the prefect system, the house system, cultural, scientific, athletic societies, etc.

Behind the prefect system is the desire to give the students the opportunity of managing and looking after their own school society and of ensuring their own security and well-being.

The house system is based on the formation of social units, other than classroom units, so as to train the students in allegiance to the society in which they live and in recognition of their duties and rights within that society. Representatives of the houses attend the general school parliament, in which the students learn the principles of the democratic way of life and parliamentary procedures, how to protect their rights and how to perform their duty to the society of which the school is a part. The role that hobbies play in Libyan schools has already been mentioned.

TRENDS AND PROBLEMS

In establishing secondary schools and technical institutes, the Government at all times takes current social, economic, and cultural needs into consideration and attempts to keep the syllabuses of these institutes and schools in line with the general development of the country.

[*Text prepared by the Ministry of Education, Tripoli, in November 1959.*]

BIBLIOGRAPHY

'Law no. 5 of 1952; the Education Law, 1952'. *Official Gazette of the United Kingdom of Libya* (*translation*), vol. 3, no. 2, 18 March 1953, p. 16–19.

STATISTICS

Population (mid-year 1958 estimate): 1,153,000.
Area: 679,360 square miles; 1,759,540 square kilometres.
Population density: 1.7 per square mile; 0.7 per square kilometre.

Summary of school statistics, 1953–57. In 1957/58, total enrolment (not including foreign schools and some 20,000 pupils receiving religious instruction in Koranic schools) was over 97,000 pupils, or about 8.5 per cent of the total population. Of these pupils, 92 per cent were in primary schools, 5 per cent in general secondary schools, about 2 per cent in vocational and teacher training schools, and 0.2 per cent at the university. The proportion of girls was 18 per cent in primary schools and in teacher training schools. In 1956 girls made up only 2 per cent of the enrolment in general secondary schools, and 9 per cent in the vocational schools. At the university there were 3 girls enrolled in 1957. The average number of pupils per teacher in 1957 was 33 in primary schools, 15 in general secondary schools, and 8 in vocational schools. Total enrolment in 1957 was higher than the previous year by 14 per cent in primary schools, and by 25 per cent in general secondary schools. In the teacher training schools, enrolment more than doubled between 1953 and 1957. (See Table 1.)

Enrolment trends in secondary education, 1947–57. Table 2 shows that enrolment in general secondary education grew from 234 pupils in 1947 to 5,271 pupils in 1957, multiplying more than 20 times in a period of 10 years. Nevertheless the average enrolment for the 3 years 1955–57 represented less than 5 per cent of the estimated population 15–19 years old.

LIECHTENSTEIN

THE EDUCATIONAL SYSTEM

The educational system in the Principality of Liechtenstein is governed by the Education Act of 9 November 1929 (*Landes-Gesetzblatt* 1929, No. 13); since then various amendments have been made to it which will necessitate recasting all school legislation in the very near future.

The sole differentiation made by the Education Act of 9 November 1929 is between the *Volksschule* (primary school) (Articles 42–78) and *Höhere Unterrichtsanstalten* (secondary schools) (Articles 79–85).

The primary schools include the *Alltagsschulen* (day schools) (Articles 52–60) and the *Fortbildungsschulen* (continuation schools) (Articles 61–71). The day schools (which correspond to the Swiss *Primarschulen*) cover 8 years of compulsory education, and the continuation schools, 2.

All other educational establishments are grouped together in the 1929 Act which has so far governed them as secondary schools.

Educational legislation is enacted by the Diet, the state legislative authority, on the proposal of the State Educational Council (*Landesschulrat*) and after prior consultation with the professional organizations concerned (i.e., the teachers' associations).

Decisions concerning curricula and regulations are taken by the State Educational Council after hearing the views of the teachers.

The Director of Education (*Schulkommissär*) is appointed by the Council. He is responsible for the drafting of legislation and curricula in public schools, and for seeing that the school laws are implemented. Private schools prepare their own curricula and submit them for approval.

TYPES OF SECONDARY EDUCATION

Secondary education as defined for the purposes of the present survey (second stage of school education proper, roughly covering the period from about 12 to 18 years of age) thus comprises classes and schools administered as primary schools as well as secondary schools proper.

The school year begins in all cases in the spring, and is divided into terms separated by the summer, Christmas and Easter holidays.

Seventh and eighth classes in the Volksschule course. These classes are also known as the *Oberstufe* (upper grades) or *Abschlussklassen* (terminal classes). Their programme is based on the new curriculum of 13 July 1948 (*Landes-Gesetzblatt* 1948, No. 15). These classes, like the *Volksschulen* in general, are maintained by the various municipalities, although for the most part the teachers' salaries are paid by the State. Under the Education Act, the supervision of these schools is the responsibility of the State Educational Council, which delegates its functions to the Director of Education.

The subordinate authority in each municipality is the Local Educational Council (*Gemeindeschulrat*).

Continuation schools. Children who have completed the *Volksschule* course and are not taking up vocational training or courses at a vocational school are required to attend a continuation school, where separate courses are given for boys and girls, for 2 years. For the boys, the course is recapitulatory in nature, with practical work and instruction in civics. For the girls, the emphasis is on home economics. A curriculum for these schools has been drawn up by the State Educational Council, which supervises them through the Director of Education. They are financed partly by the State and partly by the municipalities.

Realschulen (lower general secondary schools). A *Realschule* is maintained by the State (not the municipality) in each of the two counties. The Vaduz school was founded as early as 1858. The *Realschulen* in their present form, and also their curriculum, are governed by a Decree of 11 July 1952 (*Landes-Gesetzblatt* 1952, No. 15). Boys and girls are admitted to them on completion of 6 years of primary schooling in order to prepare themselves for particular occupations. The *Realschule* course lasts 3 years; the school year comprises 39 weeks, each normally consisting of 10 half days, with 35–38 periods a week. Supervision is exercised by the State Educational Council, acting through the Director of Education. A school principal is appointed every two years to take immediate charge of each school. The State is responsible for erecting the buildings, paying the teachers' salaries and covering the running costs, and gives yearly grants to pupils living outside the locality to meet their travelling expenses.

Private schools. Under the Education Act of 1929 (Articles 79–85), private schools also come under the State Educational Council which approves the curricula and exercises general supervision. The immediate administration of the school is in the hands of their boards of governors. So far as these schools serve the interests of the State, they receive an annual grant-in-aid towards their operational costs.

Collegium Marianum, Vaduz. This college, which is exclusively for boys, is run by Marist Brothers, and includes two schools of different types:

1. *Gymnasium* (general secondary school). This was founded as a *Progymnasium* (lower and middle part of a classical secondary school) in 1937, the boys being enrolled on completion of 5 years of primary schooling, receiving a 5-year course of secondary education and completing the rest of their studies up to the *Matura* (school-leaving certificate) level at Swiss or Austrian secondary schools. Determined efforts are now being made to develop the school up to school-leaving certificate level. The plan is to introduce a certificate course with Latin, French and English, but without Greek. The State Educational Council will in due course appoint a school-leaving certificate board.
2. *Wirtschaftliche Mittelschule* (intermediate commercial school). In 1953, an intermediate commercial school was also established. It has a 5-year course following on from the fifth year in the *Volksschule*, and teaches English as the first foreign language and French as the second. From class III onwards, it teaches shorthand, book-keeping, business management, commercial arithmetic and physics. Additional subjects in class IV are chemistry and typing, with technical drawing as an optional subject. Instruction in geography is completed in class V by economic geography, and instruction in history by an introduction to sociology. On completing class V, the pupils take a final examination set by a board appointed by the State Educational Council, and are awarded a state certificate.

Institut St. Elisabeth, Schaan. This school for girls, which has been in existence since 1946, is run by nuns. It provides a preparatory year, followed by 4 classes, and accepts pupils who have completed 5 years of primary schooling. The course concludes with a final examination which, however, is not yet organized on an official state basis. The school roughly corresponds in type with a commercial school.

Lyzeum Gutenberg, Balzers. This school, which consists merely of the last two classes of a mission school whose pupils take the lower and middle part of the course in Switzerland, was established in 1954 for the sole purpose of providing instruction for prospective members of a religious Order. The State Educational Council gives no grant-in-aid, but exercises the usual supervision and appoints the examination board which sets the school-leaving examination and issues the corresponding state certificate.

Vocational schools. Pupils who have completed courses at the *Realschulen*, or at the intermediate commercial school or private high school for girls, and embark on apprenticeship training are required to attend a vocational school (commonly known as *Gewerbeschule*, trade school) once a week during the 3 or 4 years of their apprenticeship. Because of the smallness of the territory, the State maintains no trade schools of its own but sends the apprentices to Switzerland, making a substantial contribution towards the cost of running the schools in return for the facilities granted. The syllabus is arranged by the Swiss professional organizations, Trade Federation and Apprenticeship Board, with a local Apprenticeship Board set up to watch over Liechtenstein's special interests.

Teacher training schools. There are no teacher training schools in the Principality, and prospective teachers receive their training at institutions in Switzerland. After serving two years' probation, they are required to take a local proficiency examination, and the State Educational Council appoints an examination board for that purpose.

[*Text prepared by the Department of Education, Vaduz, in December 1959.*]

STATISTICS

Population (mid-year 1958 estimate): 15,000.
Area: 61 square miles; 157 square kilometres.
Population density: 246 per square mile; 96 per square kilometre.

Summary of school statistics, 1953–57. In 1957/58, there were 2,750 pupils enrolled in the 23 public primary schools and in the 6 secondary schools. This represents a school-going population equal to about 18 per cent of the total population. Total enrolment was 13 per cent higher in 1957 than in 1953, this being mainly due to increased enrolment at the secondary level. (See Table 2.)

Enrolment trends in secondary education, 1946–57. Secondary enrolment, which was 237 in 1946, had doubled by 1955. The secondary enrolment ratio, obtained by relating the average enrolment to the estimated population 15–19 years old, was 28 for 1946–49, 32 for 1950–54 and 50 for 1955–57.

Examination results in secondary education, 1953–57. The number of *Realschule* certificates awarded was 65 in 1957/58 as against 34 in 1953/54. Of these, 30 certificates were granted to girls in 1957/58 and 14 in 1953/54. Only 5 *Matura*-certificates were granted to boys in 1957/58 against 8 in 1956/57. Ten commercial training certificates were awarded in 1957/58 and 16 in 1956/57.

Educational finance, 1957. For the year 1957 (fiscal year begins in January), the Central Government spent 882,392 Swiss francs on education, which represented an average of 60 Swiss francs per inhabitant. Five per cent of the total was for capital expenditure, and the remainder was divided as follows: 86 per cent for instructional expenditure and 9 per cent for administration and subsidies. (See Table 1.)

THE EDUCATIONAL SYSTEM

Education is dealt with under Article 23 of the Constitution (17 October 1868), which reads:

'The State shall ensure that every Luxembourg citizen receives primary education. It shall establish centres of secondary education and the necessary courses in higher education.

'The methods of financing public education and the particulars of its supervision by the central and local government authorities shall be determined by statute, as also all matters relating to education. All Luxembourg citizens are at liberty to carry out their studies either in the Grand Duchy or abroad and to attend the university of their choice save as regards the provisions of the law respecting the conditions of admission to employment and the practice of certain professions.'

The linguistic factors which affect education in Luxembourg have arisen from the geographical position of the country at the meeting-point of the Latin and Germanic worlds; since the twelfth century Luxembourg life has tended towards the former, with the result that French has become the official language whilst the national idiom is kin to the Germanic languages and German is, with a few exceptions, the language of the Church and the Press. Every layer of the population speaks Luxembourgeois (a French-Moselle dialect), a circumstance which is responsible for prolonging secondary education since the pupils must master three foreign languages (German, French and English). The country is thus trilingual (dialect, German and French), English being less widely known and opportunities for its use being more rare.

From the social point of view, the *lycées* are attended by pupils whose parents are engaged in a variety of occupations. Needy pupils are exempt from payment of school fees, which in any case are only nominal (the *minerval*). There is no discrimination on grounds of race or religion. The majority of the population is Catholic, and it rarely occurs that non-practising persons avail themselves of their right to withhold their children from courses on Christian doctrine. Finally, since the last war, a new factor has come to affect secondary schools, their methods and curricula: the arrival of children from other European countries and their participation with young Luxembourgers in the same educational programme.

Secondary education, in provincial towns as well as in the capital, is completely subordinate to the Central Government (Ministry of National Education). In theory the State is responsible for providing the buildings, furniture and equipment for secondary and vocational establishments, and for their upkeep. In practice, the respective contributions of the State and the commune in question are fixed by special laws, whose provisions may vary from one establishment to another.

Certain private bodies that possess buildings of their own provide education for girls; in this they act as substitutes for the State. These schools emphasize moral education and religious instruction.

The diagram on page 803 shows the structure of the school system.

THE DEVELOPMENT OF SECONDARY EDUCATION

Towards the middle of the nineteenth century the secondary schools belonging to the State were the Athénée at Luxembourg, the Progymnase (lower secondary school) at Diekirch and the École Moyenne et Industrielle (Secondary and Industrial School) at Echternach, which reverted to its original name of Progymnase in 1869. The two *progymnases* were transformed into *gymnases* (complete secondary schools with classical course)—the one at Diekirch, which is closer to the main economic centres of the country, in 1891 and the Echternach school in 1900. Education was still predominantly classical, but as a result of the economic and industrial expansion of the nineteenth century and in particular the exploitation of iron ores, it began to include the sciences and tended more towards practical needs.

The Athénée at Luxembourg originally comprised a *gymnase* and an industrial school; but the latter became an autonomous institution and after the addition of a commercial section was called the Industrial and Commercial School. Another industrial and commercial school was established in 1901 at Esch-sur-Alzette, chief town of the mining area; in the same year industrial sections were added to the *gymnases* of Diekirch and Echternach.

In 1908 a law was passed reforming the general secondary system by the establishment of a Greek-Latin section and a Latin section; English replaced Greek in the latter.

In 1911 two *lycées* for girls were opened at Luxembourg and at Esch-sur-Alzette; they comprised a lower division (3-year course) and an upper division (4-year course) with a Latin section, a modern languages section and a vocational section (2 years). In 1946 the 3 sections of the upper division were given a new name: Latin section, modern languages section (domestic science), and modern languages section (commercial); each of these sections is of 4 years' duration.

Since 1945 several changes have been made in the Luxembourg system of studies in order to bring it more into line with those of neighbouring and allied countries. Firstly, the industrial and commercial schools were called *lycées de garçons;* they comprise a Latin section and a modern section, an industrial sub-section and a commercial sub-section. The term 'secondary education' was given to the instruction provided in the *gymnases* (the Luxembourg Athénée and the *lycées classiques* at Diekirch and Echternach), and in the *lycées* for boys and the *lycées* for girls. Finally, the certificates awarded by secondary institutions (*diplômes de maturité* for *gymnases* and *lycées; diplômes de*

capacité for industrial and commercial schools) were given the uniform title of 'secondary school leaving certificate' (*diplôme de fin d'études secondaires*).

Vocational education. A state trade school was founded in 1896 'with the aim of providing young persons destined for the various trades with the technical or artistic knowledge and the practical aptitude which are the basis of formal apprenticeship with a private firm'.

A vocational school was established provisionally in 1914 at Esch-sur-Alzette 'with the aim of completing the practical instruction of apprentice-tradesmen by a theoretical programme designed to develop their intelligence and to introduce them to the theoretical basis of their trades'. This establishment was accorded definitive status in 1924.

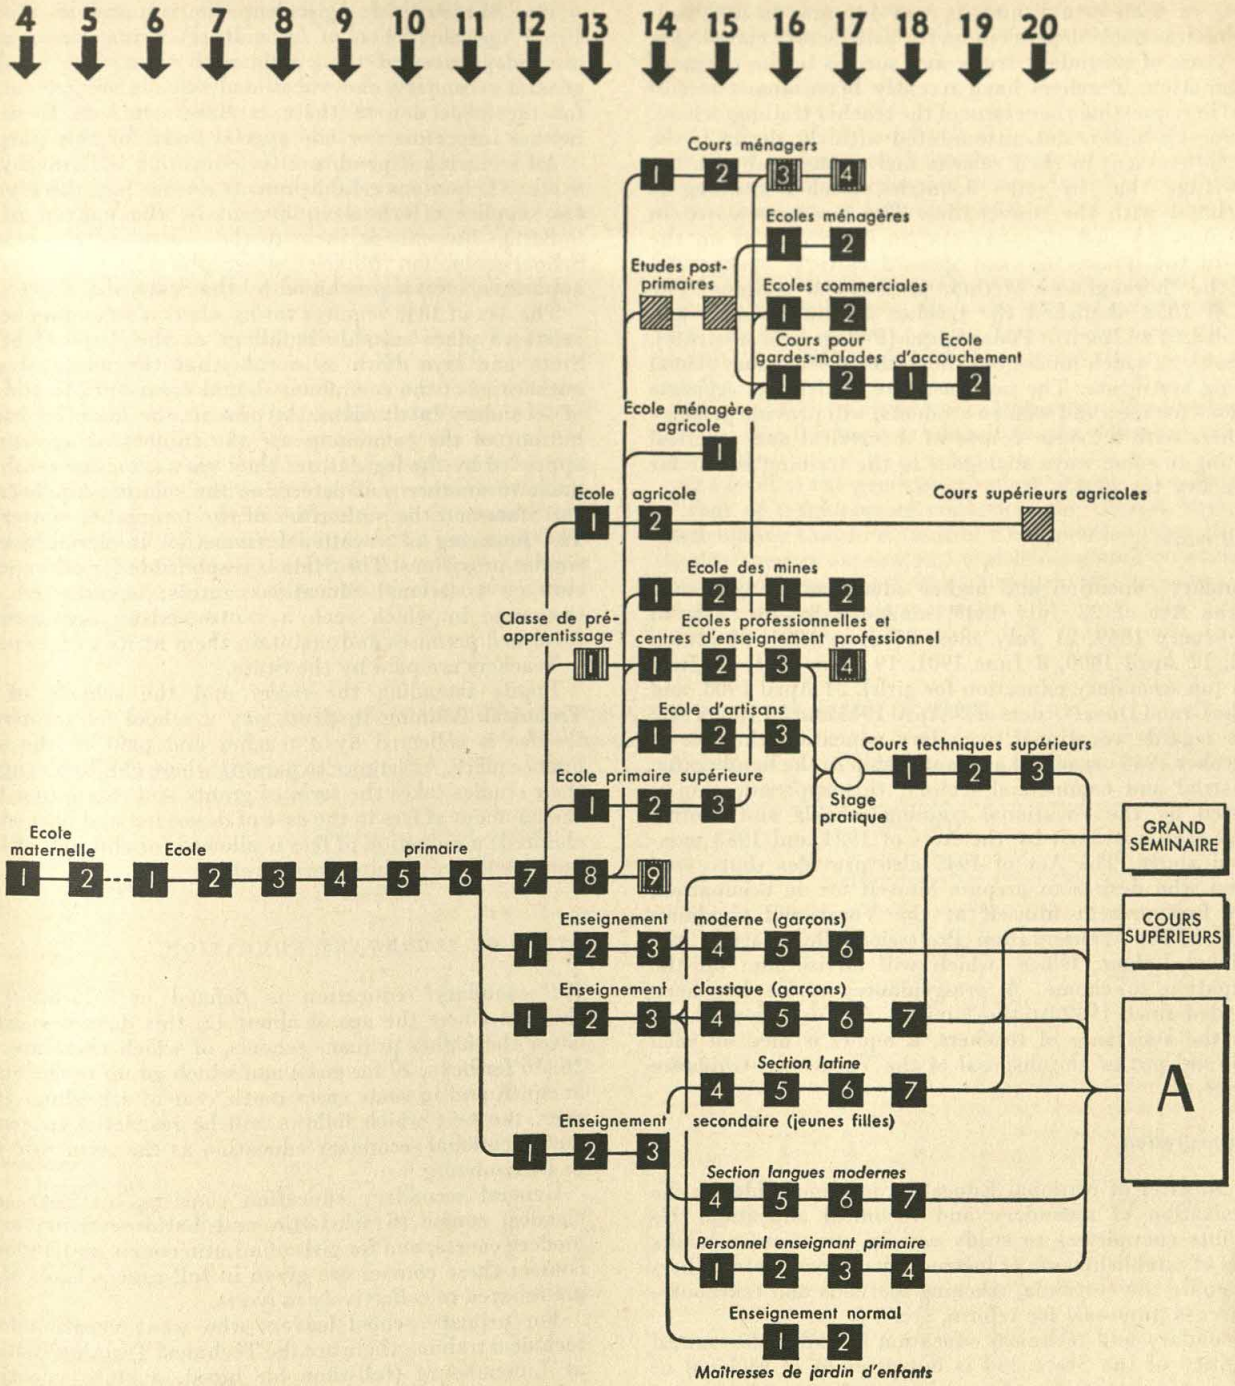
The Apprenticeship Act of 5 January 1929 made it obligatory for heads of undertakings to give their apprentices the opportunity, without loss of wages, of attending vocational courses in the communes where such courses exist. Since the promulgation of the Apprenticeship Act of 8 October 1945, which amends the Act of 1929, employers (*chambres professionnelles patronales*) are bound to enrol their apprentices in courses given by a vocational school. Each employer must ensure that his apprentices attend these courses regularly. The courses are given by the state vocational school at Esch-sur-Alzette, and by the state vocational education centres (which still have provisional status).

In 1953 an Act to establish vocational education centres for apprentices in the handicrafts, industry and commerce merely gave legal sanction to a situation of fact which had existed since 1946.

By the Act of 2 August 1958 the old École d'Artisans (lower vocational secondary school of technical studies) at Luxembourg was replaced by the Institut d'Enseignement Technique (Technical Training Institute) grouping two schools: École des Arts et Métiers (School of Arts and Crafts), with sections for training craftsmen in woodworking, cabinet-making, artistic wrought iron work, ceramics, decorative painting and sculpture, the building trades, mechanical engineering, electro-technical work and industrial tool-making; and the École Technique (Technical School), for technicians (*techniciens*) and practical engineers (*ingénieurs-techniciens*), with sections for civil engineering, mechanical engineering and electro-technology.

A Ministerial Order authorizes these two schools to give courses leading up to the qualifying examination for master-craftsmen, and also to provide refresher courses.

The Act of 1958 was intended firstly to legalize a *de facto* situation which had developed during a slow process of evolution since the promulgation of the Act of 1896, and secondly to give legal status to the former advanced technical courses (*cours techniques supérieurs*) which had been instituted provisionally in 1957.



Teacher training schools. A teacher training school has existed in the country since 1845, and was the subject of various legislative provisions until its status was fixed by the Primary Education Act of 1912. This Act established a teacher training school for male teachers (*instituteurs*), and one for female teachers (*institutrices*); the duration of the

GLOSSARY

classe de préapprentissage: pre-vocational training class.
cours ménagers: vocational training courses in home economics.
cours pour gardes-malades: vocational training courses in nursing.
cours supérieurs: see under 'Higher Education' below.
cours supérieurs agricoles: 6-month courses of advanced training in agriculture for students with at least 5 years' practical experience after leaving the *école agricole.*
école agricole: vocational training school of agriculture.
école d'accouchement: vocational training school of midwifery.
écoles des arts et métiers: lower vocational secondary school of technical studies.
école des mines: vocational training school of mining.
école maternelle: pre-primary school (nursery school or kindergarten) at which attendance is voluntary.
école ménagère agricole: vocational training school of rural home economics.
école primaire: primary school.
école primaire supérieure: literally, higher primary school ; equivalent to a lower general secondary school with practical bias.
écoles commerciales: vocational secondary schools of commerce.
écoles ménagères: vocational secondary schools of home economics.
écoles professionnelles et centres d'enseignement professionnel: part-time vocational training schools, compulsory for pupils not enrolled in full-time schools, providing theoretical training for apprentices in trade and industries.
école technique: upper vocational secondary courses of technical studies.
enseignement classique (garçons): general secondary education (boys) with compulsory Latin and optional Greek.
enseignement moderne (garçons): general secondary education (boys) without Latin.
enseignement secondaire (jeunes filles): general secondary education (girls) with course including the study of Latin (*section latine*) or course emphasizing modern languages (*section langues modernes*).
enseignement normal: teacher education, including a course for teachers in primary schools (see *institut pédagogique)* and kindergarten teachers (*maîtresses de jardin d'enfants*).
études post-primaires: post-primary studies.
Grand Séminaire: see under 'Higher Education' below.
institut pédagogique: teacher training college.
maîtresses de jardin d'enfants: see *enseignement normal.*
personnel enseignement primaire: see *enseignement normal.*
section langues modernes: see *enseignement secondaire (jeunes filles).*
section latine: see *enseignement secondaire (jeunes filles).*
stage pratique: period of practical training in trade or industry.

HIGHER EDUCATION

A. *Études supérieures à l'étranger:* higher education abroad.
cours supérieurs: post-secondary courses, equivalent to 1 year of university studies, leading to various professions including secondary teaching.
Grand Séminaire: Catholic theological seminary.

course in both establishments was 4 years. In 1929 admission was made dependent on the satisfactory completion of 3 years of secondary study and success in the entrance examination. Teachers have recently been almost unanimous in requesting the reform of the teacher training school, a request which is not unconnected with the desire to see an improvement in their salaries and status, and with the knowledge that in some countries teacher training is associated with the universities. The measures voted in 1958 may be said to guarantee an improvement on the past in the quality of their general cultural background and the thoroughness of their professional training. The Act of 1958 abolished the teacher training schools and established an Institut Pédagogique (Pedagogical Institute), entrants to which must hold the national secondary school leaving certificate. The new institute, which has separate sections for men and women students, will provide primary teachers with a 2-year course of theoretical and practical training in some ways analogous to the training course for secondary teachers.

Legal basis

Secondary education and higher education are governed by the Act of 23 July 1848, amended by the Acts of 6 February 1849, 21 July 1869, 27 June 1891, 28 March 1892, 17 April 1900, 8 June 1901, 19 June 1901, 17 June 1911 (on secondary education for girls), 21 April 1908, and by the Grand Ducal Orders of 20 April 1945 and 30 June 1945.

As regards vocational secondary education the Act of 8 October 1945 organized apprenticeship in the handicrafts, industrial and commercial sectors; this apprenticeship is assisted by the vocational training schools and centres whose status is fixed by the Acts of 1924 and 1953 mentioned above. The Act of 1945 also provides that every person who desires to prepare himself for an occupation, must first present himself at the Vocational Guidance Office (Office d'Orientation Professionnelle), part of the National Labour Office, which will advise him on the occupation to choose. A pre-guidance service has been provided since 1949 at the Ministry of Education where, with the assistance of teachers, a report is filed on each pupil and put at the disposal of the Vocational Guidance Service.

Administration

The Minister of National Education is responsible for the organization of secondary and technical education. He appoints committees to study certain questions, consults heads of establishments or instructs conferences of teachers to prepare the curricula, teaching methods and textbooks, to discuss proposals for reform, etc.

Secondary and technical education is under the central authority of the State and is independent of regional or local administrations. Supervision of secondary and vocational institutions is to a certain degree ensured by committees of trustees or supervisory commissions, whose members are chosen from the various professions; these commissions are appointed by the Minister of Education. The Minister of Labour is represented on the supervisory commissions of vocational education centres.

The Ministry of Agriculture is responsible for the École Agricole (School of Agriculture). Private institutions are independent of the public authorities. The heads of general secondary and vocational schools are responsible for the inspection of these establishments as there are neither inspectors nor any special body for this purpose.

All recurring expenditure for education is borne by the State. The various establishments do not pay the invoices for supplies of school equipment or the upkeep of the buildings but submit them to the central administration. School equipment (libraries, geographical maps, laboratory apparatus, etc.) is purchased by the State.

The Act of 1848 requires towns where a secondary school exists to place suitable buildings at the disposal of the State and lays down as a rule that the administrative authorities of the communes should contribute to the cost of secondary institutions. At present the financial contributions of the communes are the subject of agreements approved by the legislature; they vary from one establishment to another and determine the relationship between the State and the authorities of the communes concerned. The financing of vocational education is the subject of similar provisions. The State is responsible for all expenditure on vocational education centres; nevertheless, the commune in which such a centre exists must provide furnished premises and maintain them at its own expense.

Teachers are paid by the State.

Pupils attending the *lycées* and the schools of the Technical Training Institute pay a school fee (*minerval*); the fee is collected by a teacher and paid to the state finance office. Assistance to parents whose children continue their studies takes the form of grants and exemption from the payment of fees in the case of deserving and necessitous children; a reduction of fees is allowed for children of large families (three children or more).

TYPES OF SECONDARY EDUCATION

If 'secondary' education is defined as education for children above the age of about 12, this definition would cover the higher primary schools, of which there are now 26 (16 for boys, 10 for girls) and which go up to the eighth or ninth and in some cases tenth year of schooling. However, the text which follows will be restricted to general and vocational secondary education as the terms are used in Luxembourg.

General secondary education consists, for boys, of a classical course (Greek-Latin and Latin sections) and a modern course, and for girls of a Latin course and a modern course; these courses are given in full-time schools which are referred to collectively as *lycées*.

For primary school leavers who want vocational and technical training there are the Technical Training Institute at Luxembourg (full-time for boys), a state vocational school at Esch-sur-Alzette and state vocational education centres (full-time or part-time courses for boys and girls), a full-time agricultural school for boys, and full- or part-time schools of home economics for girls. There are also a number of private vocational schools throughout the country.

On completion of the classical course at secondary school the pupils may begin university studies of all kinds:

the modern section pupils may study architecture, business or public administration.

The school year in secondary and vocational establishments begins in mid-September and ends in mid-July, and is divided into three terms; there are holidays of a few days for All Saints' Day and at carnival time, a week at Whitsun, 10 days at Christmas and 12 days at Easter. The school day is from 8 a.m. until noon and from 2 to 4 p.m. in the *lycées*, and from 8 a.m. until noon and from 2 to 6 p.m. in the vocational establishments. General secondary schools have a half-holiday on Tuesdays and Thursdays, while technical schools are closed on Saturday afternoon.

In *lycées* and teacher training schools and in the Technical Training Institute, the assessment of the results obtained by the pupils is made at the end of each term at a meeting between the principal and the teaching staff and is based on the marks obtained by the pupils; at the end of the third term this meeting decides on the promotion of pupils to the class immediately above. In general secondary, teacher training and vocational schools, the pupils take the entrance and final examinations before a jury appointed by the Minister of Education. Pupils attending the *lycées* also have to pass a promotion examination permitting access to a higher class.

Apprenticeship courses have no examinations but prepare the pupil for a certificate of professional aptitude.

General secondary schools

The purpose of these schools is to give the pupil mental and moral training and help him to acquire the knowledge indispensable for an educated person. In the more advanced classes, however, it is possible to speak of a certain degree of specialization in preparation for university studies. In so far as the *lycées* in their higher classes do not prepare pupils for university entrance examinations, or for careers in public administration, their aim is to provide the country with educated citizens, giving free development to their faculties and fulfilling their responsibilities to the community.

Admission is by entrance examination. The content of the courses for boys is shown in the following weekly time-tables.

The level of the general secondary schools is comparable to that of neighbouring countries; the courses have this particularity that in default of a national language lending itself to literary expression, emphasis is placed on advanced studies in German and French, which to a certain extent are becoming national languages.

Note. Ind. = Industrial section; Com. = commercial section; figures in parentheses are optional hours.

Teaching staff. The majority (90 per cent) of the general secondary school teachers hold degrees (doctors of philosophy and literature, doctors of physical and mathematical sciences or doctors of natural sciences); the remainder consists of teachers of special subjects (commercial sciences, drawing, physical training).

Graduate teachers must hold the classical school-leaving certificate and must have followed university courses in languages or sciences for 8 terms. Teachers of special subjects must have the classical or modern school-leaving certificate and must have received training in their special subject for 6 terms.

Before receiving an appointment as teacher every candidate must after completing his studies undergo a training period (*stage pédagogique*) lasting 2 years. This period is spent as a rule in a *lycée* in Luxembourg, at the choice of the education authorities. One part of the course consists of an initiation into teaching; for this purpose the candidate-teacher must attend model lessons in the various classes and himself give lessons in his special subjects. The second part of the course consists of seminars on adolescent psychology, the theory and history of education and the methodology of the subjects which he will teach. During his training period the future teacher must write a literary or scientific thesis (*dissertation*) on a subject chosen from his special field, and a further thesis on some aspect of pedagogics or didactics. The theoretical course is followed by teaching practice.

Secondary teachers may be detached by the Minister of Education for special functions; they may act as educational or government advisers.

Vocational and technical schools

In vocational training apprenticeship constitutes the lowest level, the training of technicians and practical engineers the medium level and the training of graduate engineers (*ingénieur diplômé*) the highest level.

The importance accorded to vocational education may be judged from the number of trades for which training is provided, and the enrolment in establishments providing such education. There are 'pre-apprenticeships' (*pré-apprentissage*) in industry and commerce; there are apprenticeships for 33 trades, 9 different occupations in industry and 8 in commerce; the School of Arts and Crafts has 7 sections and the Technical School has 3 divisions.

Pre-vocational training takes place at the primary level, but as regards the actual training belongs to the technical education programme.

Training for industry and handicrafts. The Technical Training Institute at Luxembourg comprises the School of Arts and Crafts, which provides training for artisans; and the Technical School, for technicians and practical engineers.

The School of Arts and Crafts gives a 3-year course; there is an entrance examination, and candidates must be not less than 14 years of age and must first have reported to the Vocational Guidance Office. A leaving certificate equivalent to the vocational proficiency certificate (*certificat d'aptitude professionnel*) is conferred on pupils who have passed the final examination of the School of Arts and Crafts.

The Technical School has an entrance examination, for which candidates must not be under the age of 16 years. This school has a preparatory section with a course lasting 1 year and 3 years of technical studies. The diploma of technician (*diplôme de technicien*) is delivered to pupils who at the end of the second year have successfully passed a special examination. Pupils who at the end of the third year successfully pass the final examination receive the practical engineer's certificate.

The teaching staff of the School of Arts and Crafts and the Technical School comprises teacher engineers and architects in possession of a diploma, teachers in possession of a doctor's degree who hold a certificate of aptitude as teacher in the higher and secondary schools, or a special primary teacher's certificate equivalent to the former, teachers of commercial sciences, vocational education teachers, workshop chiefs and lecturers.

The State Vocational School at Esch-sur-Alzette provides training for the principal trades, and at present has nine apprenticeship sections. A full-time pre-apprenticeship class with courses lasting four terms is attached to the school.

The state vocational education centres, of which there are seven in the country, also provide training for the principal trades. These schools do not deliver a school leaving

certificate, but they prepare for a certificate of professional aptitude which is given to apprentices who successfully pass the examination at the end of their apprenticeship.

At the hotel management school the full-time classes (1 October to 1 May), alternate with practical work in the trade (apprenticeship to an hotel from 1 May to 15 July).

The relations between the various technical and vocational schools on the one hand, and commerce and industry on the other, are governed by an inter-ministerial committee comprising the Ministers of National Education, of Labour and of Economic Affairs, who act in consultation with three different committees dealing respectively with vocational training for industry, commerce and the artisan trades.

Mention should also be made, in connexion with technical education, of the Emile-Metz Institute at Dommeldange, which is privately financed and of two schools, the vocational school at Differdange and the School of Mines at Esch-sur-Alzette, the costs of which are shared equally between the State, the commune and private enterprise. The last-mentioned school is a part-time institution consisting of a preparatory school (2 years) and a school of mines proper (also 2 years), which trains pit foremen, pit managers and surveyors.

Training for commerce and the distributive trades. This is provided in, among other establishments, a commercial school which is part of the vocational school of Esch-sur-Alzette, vocational education centres at Luxembourg, Ettelbruck and Wiltz, the hotel management school at Diekirch, and a number of communal and private schools with commercial sections which prepare for the official examinations in accounting, shorthand and shorthand-typing.

Agricultural training. The State School of Agriculture was established in 1883 at Ettelbruck for young farmers. The course lasts 2 years and the pupils are all boarders. After passing the final examination the pupils receive a diploma, which qualifies them for careers in agricultural co-operatives or in communal administration, as well as in practical agriculture.

Education is both theoretical and practical, and general education is given an important place. Practical work, which is complemented by demonstration visits, is carried out in the testing fields and in the garden of the school.

The school also organizes higher courses, which are accessible to former pupils possessing the final diploma, who have worked for two years on farms. These higher courses last five months.

In addition to the regular courses of the School of Agriculture, seasonal courses are given by senior officials of the Services de Vulgarisation Agricole (Agricultural Propaganda Service). These courses are organized regularly during the winter months and take place alternately in three of the six districts (*circonscription*) of the country. Pupils of all ages, from 16 to 50, take part in these courses.

Home economics. Girls may follow courses at the state École Ménagère Agricole (Rural Home Economics School) at Mersch, which was founded in 1947. This school takes pupils between the ages of between 15 and 16 years, and provides both theoretical and practical training.

There are 21 communal and private schools of home economics, which are subsidized by the State and prepare for the official examinations for the certificates of kindergarten teacher, domestic training teacher and handicraft teacher.

Teacher training schools

As already mentioned, the 4-year teacher training schools based on only 3 years of secondary schooling were abolished and replaced by the Pedagogical Institute. Since entrants must be over the age of 18 and have completed their secondary studies, the institute does not come within the scope of this report. However, the change is of recent date and pupils enrolled in July 1958 in the teacher training schools are to complete their training under the programme of these schools. Thus, in the autumn of 1958 the teacher training schools had only three classes instead of four; in the autumn of 1959 they were reduced by a further class and in the autumn of 1960 only the final class will still be in existence. The first class of the Pedagogical Institute will begin to operate in the autumn of 1960, and the second in the autumn of 1961, by which date the teacher training schools will be finally eliminated.

Pupils undergoing training at the institute (*stagiaires*) will receive a salary (*indemnité de stage*). At the end of the second year of studies they will take a final examination to obtain the teacher's certificate (*brevet d'aptitude pédagogique*).

Specialized schools

The Conservatoire de Musique de Luxembourg is a municipal establishment subsidized by the State and under the control of a supervisory committee of five members, two of whom are appointed by the Government. Pupils are of both sexes and there is no age limit.

The École de Musique at Esch-sur-Alzette is a municipal establishment subsidized by the State and controlled by a municipal supervisory committee of seven members.

TRENDS AND PROBLEMS

A reform now in preparation will effect a more organic relation between secondary and primary education. With a view to shortening the period of secondary schooling by one year without lowering the educational standards, the real secondary course will begin in the primary school, in a special sixth class for those pupils who intend to continue their studies. This class will remain a part of the primary school.

The courses in the *lycées* for boys and for girls (Latin section and modern languages section) will also last 6 years. It is proposed to make the work more specialized during the final year, on the conclusion of which the usual leaving certificate will be conferred. The preparation for administrative careers and university studies will not be changed.

The proposed reform envisages the constitution of a Fund for Study Grants which will emphasize the democratic nature of university loans.

Other proposed reforms will make possible the elimination of the promotion examination (between the fourth and fifth years in the boys' *lycées* and between the third and fourth years in the girls' *lycées*), and the adoption of a different promotion system from one class to another: account will be taken of pupils' marks at the end of each of the three terms instead of those obtained at the end of the third term only.

A general educational reform has already been begun, taking full account of pedagogical factors. The present age requires that young people should have from their early years a heightened sense of discipline and responsibility, well-informed minds and well-tempered characters. Besides providing instruction, the school will thus stress the development of the whole person; primary teachers will be prepared for their tasks at the Pedagogical Institute and secondary teachers through a new system of training which is to be established for them. Also with a view to emphasizing this broader interpretation of education, an Educational Council (Conseil d'Education) is to be set up for the secondary level, replacing the Schools Commission (Commission Scolaire) and Committee of Trustees (Commission des Curateurs) which have up to now supervised the institutions; parents will have a voice on the new council, and it is possible that pupils will be accorded consultative status.

Technical and vocational education was reformed in 1958. It will take more and more into account modern production methods and will establish in the two schools of the institute at Luxembourg the working conditions which the pupils will meet in factories, technical services, research offices and workshops. An enlargement of the premises is envisaged, and particularly of the machine-shop, so that professional apprenticeship may take place under the best possible conditions.

STATISTICS

Population (mid-year 1958 estimate): 320,000.
Area: 998 square miles; 2,586 square kilometres.
Population density: 321 per square mile; 124 per square kilometre.

Summary of school statistics, 1953–57. In 1957/58, there were 39,000 pupils enrolled in all public schools, which account for the major part of pupil enrolment. Including private education, the total enrolment, which may be estimated at 42,000, would represent about 13 per cent of the total population. The enrolment in public schools was distributed by level as follows: pre-primary 10 per cent; primary 69 per cent; secondary general 11 per cent, vocational 8 per cent, teacher training, less than 1 per cent; the rest being students enrolled in 2 university courses and children enrolled in special schools for handicapped children. Girls made up 50 per cent of the primary school enrolment and 26 per cent of the enrolment in general secondary schools. Women teachers were 51 per cent of the teaching staff in primary schools, where the pupil-teacher average was 24. Between 1953 and 1957, primary school enrolment *decreased* by 5 per cent. (See Table 4.)

Enrolment trends in secondary education, 1930–57. Pupil enrolment in public schools was 60 per cent higher in 1957 than in 1934 for general secondary education, 6 times as high for vocational education, and 50 per cent higher for teacher training. In vocational schools, there was a substantial decline from the high enrolment figures reached in 1947 and 1948. Taking all three categories of public secondary schools together, the average total enrolment in 1955–57 represented about 37 per cent of the estimated population 15–19 years old. (See Table 2.)

1. EDUCATIONAL FINANCE, 1957 (in Luxembourg francs)[1]

Recurring expenditure by level and type of education[2]	Amount		Per cent	
Total recurring expenditure[2]		**[3]272 121 293**		**100.0**
Primary education		155 709 365		57.2
Secondary education[4]		109 248 906		40.2
General[4]	74 182 171		27.3	
Vocational	32 166 316		11.8	
Teacher training	2 900 419		1.1	
Higher education[4]		...		...
Special education		7 163 022		2.6

1. Official exchange rate: 1 Luxembourg franc = 0.02 U.S. dollar.
2. Recurring expenditure of the Ministry of National Education only. In addition, 10,740,000 francs were allocated to the communes for school buildings and 5,416,092 francs were contributed by the Ministry of Agriculture for agricultural education. Data concerning expenditure made by other Ministries and the communes are not available.
3. Including expenditure for adult education but not including expenditure for central administration or for pre-primary education (financed by the communes).
4. Expenditure for higher education is included with general secondary education.

Examination results in secondary education, 1953–57. The number of secondary school leaving certificates increased by more than 50 per cent between 1953 and 1957; the proportion of girls receiving these certificates was 28 per cent in 1957/58. A total of 888 certificates were granted in 1957 for various types of vocational training, as compared with 858 in 1953. Teacher's certificates doubled. (Table 3.)

Educational finance, 1957. Recurring expenditure for education from the Ministry of Education amounted to 272 million francs, averaging 860 francs per inhabitant. (See Table 1.)
